DEALING WITH RECENT EVENTS AND DEVELOPMENTS

THE SECOND OF THE NEW VOLUMES, BEING
VOLUME XXVI
OF THE COMPLETE WORK

ADAM & CHARLES .
BLACK, EDINBURGH
& LONDON . . .

PUBLISHED BY

‘THE TIMES’ . . .
PRINTING HOUSE
SQUARE, LONDON

MCMII

THE EDITORS

SIR DONALD MACKENZIE WALLACE,
K.C.I.E., K.C.V.O.

ARTHUR T. HADLEY, PH.D., LL.D.,
PRESIDENT OF YALE.

HUGH CHISHOLM, B.A.
(FORMERLY SCHOLAR OF C.C.C. OXFORD)

THE DEPARTMENTAL EDITORS

FOR LAW AND GOVERNMENT:
THE HON. SIR JOHN SCOTT, K.C.M.G.,
Deputy Judge-Advocate-General.

FOR MILITARY AFFAIRS:
SIR GEORGE SYDENHAM CLARKE, K.C.M.G.,
F.R.S.

FOR MEDICAL SCIENCE:
D. NOEL PATON, M.D., B.Sc., F.R.C.P.ED.

FOR THEOLOGY:
REV. W. E. COLLINS, M.A., Prof. of
Ecclesiastical Hist. at King's Coll.,
Lond.

FOR MINING:
HENRY M. HOWE, A.M., Prof. of Metal-
lurgy at Columbia University.

FOR BOTANY:
D. H. SCOTT, M.A., PH.D., F.R.S., Hon.
Keeper, Jodrell Laboratory, Kew.

FOR GEOGRAPHY AND STATIS-
TICS:

J. SCOTT KELTIE, F.S.S., F.S.A.SCOT,
LL.D., Sec. Roy. Geog. Soc.

FOR ASTRONOMY:
SIMON NEWCOMB, PH.D., LL.D.

FOR MATHEMATICS:
JOSEPH LARMOR, M.A., D.SC., SEC.R.S.,
University Lecturer in Mathematics,
Cambridge.

FOR ELECTRICITY:
J. A. FLEMING, M.A., D.SC., F.R.S., Prof.
of Electrical Engineering, Univ. Coll.,
London.

FOR ART:
M. H. SPIELMANN, Editor of the *Magazine of Art*.

FOR ZOOLOGY:
G. H. FOWLER, PH.D.

FOR NAVAL AFFAIRS:
JAS. RICHARD THURSFIELD, M.A.

FOR BIOGRAPHY:
RICHARD GARNETT, C.B., LL.D.

FOR LITERATURE:
EDMUND GOSSE, LL.D.

FOR ECONOMICS:
WYNNARD HOOPER, M.A.

FOR RAILWAYS:
MAJOR HENRY G. PROUT, Editor of
Railroad Gazette, N.Y.

FOR MUSIC:
J. A. FULLER MAITLAND, M.A., F.S.A.

FOR GAMES AND SPORTS:
ALFRED WATSON, Editor of the *Badminton Library*.

THE ASSOCIATE EDITORS

PHILIP ASHWORTH, DR. JUR.
H. M. ROSS, B.A.

FRANKLIN H. HOOPER, A.B.
E. H. WILLIAMS, M.D.

THE SUB-EDITORS

JAMES A. MANSON.

G. B. LYNES, A.M.

ENCYCLOPÆDIA BRITANNICA.

VOLUME XXVI (AUSTRIA-HUNGARY—CHICACOLE)

PRINCIPAL CONTENTS.

PREFATORY ESSAY: A GENERAL SURVEY OF RECENT POLITICAL PROGRESS. EDWARD DICEY, C.B., Author of "Cavour," "England and Egypt," "Victor Emmanuel," &c.

- AUSTRIA-HUNGARY. *Geography and Statistics*, K. TH. VON INAMA-STERNEGG, Professor of Political Science, Vienna University, and President of the Statistische Central-Kommission, Vienna; *History*, J. W. HEADLAM, late Fellow of King's College, Cambridge.
- AVERAGE, GENERAL. T. G. CARVER, K.C., Author of the "Law relating to the Carriage of Goods by Sea."
- BABIISM. E. G. BROWNE, M.B., Professor of Persian, Cambridge University.
- BABYLONIA AND ASSYRIA. The Rev. A. H. SAYCE, D.D., Professor of Assyriology, Oxford University.
- BACCHYLIDES. Sir RICHARD JEBB, Litt.D., LL.D., M.P., Regius Professor of Greek, Cambridge University.
- BACTERIOLOGY. *General*, H. MARSHALL WARD, D.Sc., F.R.S., Professor of Botany, Cambridge University; *Pathological*, ROBERT MUIR, M.D., Professor of Pathology, Glasgow University.
- VON BAER. EDWARD CLODD, Author of "A Primer of Evolution," &c.
- BAGEHOT, BALANCE OF TRADE. Sir ROBERT GIFFEN, K.C.B., F.R.S., late Controller-General of Commercial, Labour, and Statistical Departments of the Board of Trade.
- BALANOGLOSSUS. A. WILLEY, D.Sc.
- BALKAN PENINSULA. J. D. BOURCHIER, M.A., Correspondent of "The Times" at Athens.
- BALLOONS, MILITARY. Major BADEN F. S. BADEN-POWELL, late President Aeronautical Society.
- BALTIC SEA. H. N. DICKSON, Lecturer in Physical Geography, Oxford University.
- BALTIMORE. FABIAN FRANKLIN, Ph.D., Editor of the "Baltimore News."
- BALUCHISTAN. Sir T. H. HOLDICH, K.C.I.E., Author of "The Indian Borderland," &c.
- BANCROFT, GEORGE. WM. M. SLOANE, LL.D., Professor of History, Columbia University, New York.
- BANKING. *Europe*, R. H. INGLIS PALGRAVE, Editor of "A Dictionary of Political Economy"; *United States*, THOMAS L. GREENE, Manager of the Audit Company, New York; *Law of*, Sir J. R. PAGET, Bart., K.C., Gilbert Lecturer on Banking, King's College, London.
- BANKRUPTCY. *Great Britain*, J. SMITH, C.B., Inspector-General in Bankruptcy; *United States*, H. G. NEWTON, LL.B., Referee in Bankruptcy, New Haven, Conn.
- BANTU LANGUAGES. Sir HARRY JOHNSTON, K.C.B., Special Commissioner for Uganda Protectorate.
- BANVILLE. Lord CREWE.
- BAPTISTS. *United Kingdom*, the Rev. W. E. COLLINS, M.A., Professor of Ecclesiastical History, King's College, London; *United States*, the Rev. W. H. P. FAUCET, D.D., President of Brown University, Providence.
- BARBIZON SCHOOL. GEORGE CLAUSEN, A.R.A.
- BARNES. ARTHUR WAUGH, Author of "Alfred, Lord Tennyson."
- BARNFIELD. EDMUND GOSSE, LL.D.
- BAROTSE. Sir HARRY JOHNSTON, K.C.B.
- BARRACKS. *Great Britain*, Colonel HERBERT LOCOCK, C.B., formerly Inspector-General of Fortifications; *India*, Major E. H. HEMMING, R.E.
- BASE-BALL. WALTER CAMP, Author of "Book of College Sports," "American Football," &c.
- BASUTOLAND. *Geography*, Professor A. H. KEANE; *History*, ALFRED HILLIER, M.D., Author of "South African Studies."
- BAYREUTH. J. A. FULLER MAITLAND, M.A., F.S.A.
- BEACONSFIELD. FREDERICK GREENWOOD.
- BECHUANALAND. *Geography*, Professor A. H. KEANE; *History*, ALFRED HILLIER, M.D.
- BEECHER. The Rev. LYMAN ABBOTT, D.D., Editor of "The Outlook," New York.
- BELFAST. W. HALDANE PORTER.
- BELGIUM. *Geography*, J. DU FIEF, Secretary of the Royal Belgian Geographical Society; *Recent History*, L. LECLÈRE, Professor of History, Brussels University; *Recent Literature*, ARTHUR SYMONS.
- BELGRADE. CHEDROMILLE MIJATOVICH, formerly Serbian Minister to the Court of St. James's.
- BENEFICE. G. G. PHILLIMORE, B.C.L.
- BENGAL. J. S. COTTON, M.A.
- BENIN. Lieut.-Col. H. L. GALLWEY, C.M.G., and Sir GEORGE S. CLARKE, F.R.S., Governor of Victoria.
- BENSON. The Rev. W. E. COLLINS, M.A.
- BENTHAM. Sir W. T. THISELTON-DYER, LL.D., F.R.S., Director of the Royal Gardens, Kew.
- BERI-BERI. ARTHUR SHADWELL, M.D.
- BERLIN. PHILIP A. ASHWORTH, Dr.Jur. (Würzburg).
- BESSEMER. H. M. ROSS.
- BETTING. A. E. T. WATSON ("Rapier"). Editor of the "Badminton Magazine" and "Badminton Library."
- BEUST. J. W. HEADLAM, late Fellow of King's College, Cambridge.
- BHAMO. Sir J. G. SCOTT, G.C.I.E., Deputy Commissioner for Burma.
- BILLIARDS. Major WILLIAM BROADFOOT, R.E., Author of "Billiards."
- BILLS OF EXCHANGE. M. D. CHALMERS, C.S.I.
- BIMETALLISM. Major LEONARD DARWIN.
- BIRDS. HANS GADOW, Ph.D., F.R.S., Lecturer on Zoology, Cambridge University.
- BIRMINGHAM. The Rev. L. P. JACKS.
- BISMARCK. J. W. HEADLAM.
- BLACK SEA. J. Y. BUCHANAN, F.R.S., formerly Lecturer in Geography, Cambridge University.
- BLAINE. The Hon. CHARLES EMORY SMITH, formerly U.S. Postmaster-General; Editor of "The Press," Philadelphia.
- BOHEMIA. ÆNEAS O'NEILL, Assistant Correspondent of "The Times," Vienna.
- BOILERS. J. T. MILTON, M.Inst.C.E., Member of Admiralty Boiler Committee.
- BOKHARA. PRINCE KROPOTKIN.
- BOMBAY. J. S. COTTON, M.A., Editor of various Reports on India; Author of "India" (Citizen Series).
- BOOKBINDING. CYRIL J. DAVENPORT, Author of "Royal English Bookbindings."
- BOOK-PLATES. EGERTON CASTLE, Author of "English Book-plates."
- BOOK PRINTING. CHARLES RICKETTS.
- BOOTH. JOSEPH JEFFERSON, LL.D., Author of "Autobiography," etc.
- BORNEO. C. M. KAN, Professor of Geography, Amsterdam University, and HUGH CLIFFORD, C.M.G., Governor of Labuan and British North Borneo.
- BORROW. T. WATTS-DUNTON.
- BOSNIA. K. TH. VON INAMA-STERNEGG, Professor of Political Science, Vienna University, and President of the Statistische Central-Kommission.
- BOSTON. E. M. BACON, Author of "Boston Illustrated."

BOULANGER, BOURBAKI. HUGH CHISHOLM, one of the Editors of the New Volumes of the "Encyclopædia Britannica."

BOWEN. E. A. ARMSTRONG.

BOWLS. J. A. MANSON.

BRACHIPODA. A. E. SHIPLEY, M.A., F.Z.S., Lecturer in Invertebrate Morphology, Cambridge University.

BRAHMAPUTRA. Sir T. H. HOLDICH, K.C.I.E.

BRAHMS. J. A. FULLER MAITLAND, M.A., F.S.A.

BRAKES. G. H. BANISTER, M.Inst.C.E., E. M. HERR, General Manager Westinghouse Air Brake Company, Pittsburg, and H. M. ROSS.

BRAMWELL. E. A. ARMSTRONG.

BRAZIL. *Geography and Statistics*, The Hon. W. W. ROCKHILL, Head of the Bureau of American Republics, Washington, and I. P. A. RENWICK; *History*, C. E. AKERS.

BREWING. PHILIP SCHIDROWITZ, Ph.D., F.C.S.

BRIBERY AND CORRUPT PRACTICES. L. L. SHADWELL, Secretary to the Commissioners in Lunacy.

BRIDGE. W. H. WHITFIELD, Card Editor of "The Field."

BRIDGES. W. CAWTHORNE UNWIN, F.R.S., Professor of Engineering at the City and Guilds of London Central Technical Institute.

BRIGHT. P. W. CLAYDEN (the late), Author of "England under the Coalition."

BRITISH COLUMBIA. G. M. DAWSON, LL.D., F.R.S. (the late), Director-General of the Canadian Geological Survey, and MOLYNEUX ST. JOHN.

BRITISH EMPIRE. Miss FLORA SHAW.

BRONGNIART. SYDNEY HOWARD VINES, D.Sc., F.R.S., Sherardian Professor of Botany, Oxford University.

BROKERS. LESLIE FREDERIC SCOTT.

BROOKS. The Rt. Rev. WILLIAM LAWRENCE, D.D., Bishop of Massachusetts.

BROWN, FORD MADOX. W. M. ROSSETTI.

BROWN, T. E. A. T. QUILLER-BOUCH.

BROWNING. LESLIE STEPHEN, Litt.D., Editor of "Dictionary of National Biography."

BRUSSELS. J. DU FIEF, Secretary of the Royal Belgian Geographical Society.

BRYANT. GEORGE W. CABLE, D.L., Author of "Old Creole Days," &c.

BRYOPHYTA. W. H. LANG, M.B., D.Sc., Lecturer in Botany, Queen Margaret's College, Glasgow University.

BUDAPEST. AENEAS O'NEILL.

BUDDHISM. T. W. RHYS DAVIDS, Ph.D., LL.D., Professor of Pali and Buddhist Literature, University College, London.

BUILDING SOCIETIES. *Great Britain*, E. W. BRABROOK, C.B., Chief Registrar of Friendly Societies; *United States*, Hon. CARROLL D. WRIGHT, Commissioner of Labour of the United States.

BUILDING. GEORGE B. POST, Mem. Am. Soc. C.E.

BULGARIA. J. D. BOURCHIER, M.A., Correspondent of "The Times" at Athens.

BULL-FIGHTING. A. E. T. WATSON ("Rapier"), Editor of the "Badminton Magazine" and "Badminton Library."

BUOY. Captain J. WHITLY DIXON, R.N.

BURGON. The Rev. J. J. LIAS, Chancellor of Llandaff Cathedral.

BURIAL AND BURIAL ACTS. G. G. PHILLIMORE, M.A.

BURMA. Sir J. G. SCOTT, G.C.I.E., Deputy Commissioner for Burma.

BURMESE WAR. Captain E. PEACH, Indian Staff Corps.

BURNE-JONES. LAURENCE BINYON, British Museum.

BURTON. STANLEY LANE-POOLE, Litt.D., Professor of Arabic, Trinity College, Dublin.

BYRD. W. BARCLAY SQUIRE, Editor of "Byrd's Masses."

CABALLERO. J. FITZMAURICE-KELLY, Author of "A History of Spanish Literature."

CADIZ. A. E. HOUGHTON, Correspondent of the "Standard" in Spain.

CAIRNS. E. A. ARMSTRONG.

CAIRO. Major H. G. LYONS, R.E., Public Works Department, Egypt.

CALIBRATION, CALORIMETRY. H. L. CALLENDAR, LL.D., F.R.S., Professor of Physics, Royal College of Science, London.

CALIFORNIA. CHARLES F. LUMMIS, Editor of the "Land of Sunshine," Los Angeles, California.

CAMBODIA. M. DE LANESSAN, formerly Governor-General of French Indo-China.

CAMPANOLOGY. The Rev. T. L. PAPILLON, M.A., late Fellow of New College, Oxford.

CAMPOS. A. E. HOUGHTON.

CANADA. *Geography*, G. M. DAWSON, LL.D., F.R.S., (the late), Director-General of the Canadian Geological Survey, and MOLYNEUX ST. JOHN; *Agriculture*, Jas. W. ROBERTSON, Canadian Commissioner of Agriculture and Dairying; *History*, G. R. PARKIN, LL.D., C.M.G., Principal of Upper Canada College, Toronto.

CANALS AND INLAND NAVIGATION. Sir E. LEADER WILLIAMS, M.Inst.C.E., Consulting Engineer of the Manchester Ship Canal; *United States*, Gen. O. H. ERNST, Member of the U.S. Isthmian Canal Commission.

CANCER. ARTHUR SHADWELL, M.D.

CANONS OF HIPPOLYTUS. The Rev. J. ARMITAGE ROBINSON, Ph.D., D.D., Canon of Westminster.

CANOVAS DEL CASTILLO. A. E. HOUGHTON.

CAPE COLONY. *Geography*, Professor R. MACWILLIAM, Gill College, Cape Colony; *History*, ALFRED HILLIER, M.D., Author of "South African Studies," &c.

CAPITAL PUNISHMENT. W. F. CHAIKES, Editor of "Statutes relating to Criminal Law," &c.

CARICATURE. *English*, F. W. WHYTE, Author of "Actors of the Century"; *French*, ARMAND DAYOT, Inspector of Fine Arts, Paris; *German*, RICHARD MÜLLER, Professor of Art History, Breslau University; *American*, RUPERT HUGHES.

CARLYLE. LESLIE STEPHEN, Litt.D., Editor of "Dictionary of National Biography."

CARTOON. M. H. SPIELMANN, Editor of the "Magazine of Art."

CASTELAR. A. E. HOUGHTON.

CATACOMBS. The Rt. Rev. W. R. BROWNSLOW, D.D., (the late), R.C. Bishop of Clifton.

CAUCASUS. PRINCE KROPOTKIN.

CAYLEY. Major P. A. MACMAHON, Sc.D., F.R.S.

CEMENT. BERTRAM BLOUNT, Assoc.Inst.C.E., Consulting Chemist to the Crown Agents for the Colonies.

CENSUS. J. A. BAINES, C.S.I., formerly Census Commissioner under the Indian Government; *1901 Census*, WALTER F. WILCOX, Ph.D., Chief Statistician, Division of Methods and Results, 12th U.S. Census, and Professor of Social Science and Statistics, Cornell University.

CENTRAL AFRICA, BRITISH. Sir HARRY JOHNSTON, K.C.B., Special Commissioner for Uganda Protectorate.

CEYLON. J. FERGUSON, Editor of "Ceylon Observer."

CHANNEL TUNNEL. W. BOYD DAWKINS, D.Sc., F.R.S., Professor of Geology, Oxford University.

CHANTABUN. H. WARREN SKYER, M.A., Author of "Five Years in Siam."

CHARITIES. C. S. LOCH, Secretary of the Charity Organization Society, London.

CHARTERED COMPANIES. W. B. DUFFIELD.

CHEMISTRY. HENRY E. ARMSTRONG, Ph.D., LL.D., F.R.S., Professor of Chemistry at the City and Guilds of London Central Institute.

CHERBULIEZ. LORD CREWE.

CHESS. L. HOFFER, Author of "Chess," &c.

PREFATORY ESSAY.

A GENERAL SURVEY OF RECENT POLITICAL PROGRESS.

By Edward Dicey, C.B.

TO find any single phrase which could adequately describe the tendencies of human thought, policy, and statecraft during the last quarter of the 19th century is an obvious impossibility. But the nearest approximation to such a phrase would probably be to employ the phrase "Conservative reaction" as characterizing the period in question. This phrase, if used not in the way the expression is commonly employed, as referring to party politics, but in a wider sense, expresses a general phase of mind in most, if not all, the self-governing countries of the world, which, for good or bad, has of late years influenced their State policy in a uniform direction. To put the same idea in another, and perhaps simpler, manner, it may be said that the spirit of the times was progressive during the first three quarters of the 19th century, and unprogressive, if not reactionary, during the last quarter. The course of human affairs is not regulated by fixed laws, such as those which govern the rise and fall of the tides. It is therefore idle to discuss the exact date at which the movement in favour of progress reached its apogee, or the date at which reaction set in. But men whose memories extend over half a century will probably agree in saying that in Great Britain, as in all other countries where the conditions of public life are at all similar, the ideas which commended themselves to public approval in the first-named of these periods lost their sway during the years that have come and gone since the ninth edition of the *Encyclopædia Britannica* first saw the light of day. The International Exhibition of 1851 formed the high-water mark of the progressive movement, though at the time it was commonly regarded as the commencement of a new and better era, in which wars were to cease, the progress of science was to ameliorate the fundamental conditions of human existence, and free democratic institutions were to unite the nations of the world in bonds of amity and goodwill. During the quarter of a century which followed the World's Fair in Hyde Park, the belief in the progress of humanity retained its ground. Up to 1870, or even later, the creed of Liberalism was held, or at any rate professed, by the great majority of thinking men in all countries, and in consequence its prestige continued long after the fervour of belief had passed away. The course of events had for many previous years been gradually undermining popular faith in the efficacy of democratic institutions, or of the discoveries of science to modify materially the lot of mankind upon the earth. Then, again, the doctrines on which the system of Free Trade was based had not succeeded in commanding general assent; or, to speak more correctly, the results which its adoption was regarded as certain to produce had not been realized. Moreover, the working classes throughout the Old World and the New had had their faith in parliamentary institutions severely shaken by the fact that the general organization of society, in so far as labourers and artisans were concerned, remained much the same under democratic institutions as they had been under aristocratic or oligarchical rule.

In consequence, the hewers of wood and drawers of water had begun to lose their enthusiasm for political reform as a means of ameliorating their own condition, and to base their hopes on Socialistic schemes for the regeneration of society, schemes which, whether sound or unsound, were diametrically opposed to the cardinal dogmas of old-fashioned Liberalism—that State intervention was an evil in itself; that Capital and Labour would each thrive best by being at liberty to fight their own battles; and that any effort on the part of the State to interfere with absolute freedom of contract, and to regulate the profits of Capital on the one hand, or the wages, hours, and conditions of Labour on the other, was foredoomed to failure. The growth of Socialist ideas amidst the working class had tended to dissolve the political alliance which had existed for so many years between the operative class and the lower middle class. Shopkeepers, clerks, small employers, and the less prosperous of the rate-paying classes had become alarmed at the Socialist schemes which had found favour with workmen and labourers; while they also resented the growing authority of Trades Unions. In consequence, the vast class which lies between the poor and the wealthy had gradually gravitated towards Conservatism as distinguished from Liberalism. Moreover, it cannot be doubted that the tone of modern thought and the consequent decay of dogmatic religious belief to some extent modified the aspirations and ideals of civilized mankind. Doubts as to the merits of unrestricted competition as a system capable of universal application; a tendency to look to State action, rather than to individual effort, as the best remedy for social evils; a fear of the supremacy of the masses by the property-owning part of the community; and a widespread desire for the reorganization of the world on the basis of social, as distinguished from political, reform, are some of the chief factors which influenced the policy of all progressive States during the last five-and-twenty years of the 19th century, and led to various changes in their internal fabric, and, in some instances, in their external relations with one another.

The shadow of the great Franco-German war of 1870–71 has lain over the years which have come and gone since the German armies entered Paris as conquerors. The direct results of the campaign are obvious enough. Germany became the leading State in continental Europe, while France was **Wars.** relegated to the second, if not to the third, place amidst the Great Powers of the mainland. Her loss of territory is insignificant as compared with her loss of authority; and the authority she still exerts is mainly due to her grand traditions and to the alliance contracted with Russia. The indirect effects of the war of 1870–71, though less obvious, are certainly not less important. The outcome of the German victories throughout the length and breadth of France was to deal a death-blow to the common belief that the era of wars of aggression and conquest had come to an end, and that under free governments, in which the influence of the democracy was supreme, international issues would be settled by arbitration instead of by the brute force of arms. This belief, it may be urged, ought to have been already dispelled by the series of wars which had agitated the world for many years previous to 1870. But each one of these wars might be ascribed, not altogether without justice, to other causes than to the greed of conquest, the dynastic ambitions, or the lust of power, which, according to the leading popular teachers of the day, were solely responsible for the wars of a bygone period. The Franco-Italian war of 1859 was justified by the desire of France to assist Italy in recovering her national independence. The civil war in North America was regarded as a struggle for the abolition of slavery. The invasion of Denmark by Prussia and Austria was excused on the plea that it was waged to uphold the principle of nationality, outraged, or alleged to be outraged, by the rule of the Danes in Schleswig-Holstein. The Seven Days' campaign, which ended at Sadowa, was supposed to have been due to the paramount necessity of creating a united Fatherland. Popular delusions die hard; and all these indications that, now as heretofore, might is the supreme arbiter upon earth failed to shake the idea, embodied in the Exhibition of 1851, that the days of aggressive warfare had passed away never to return. But no faith, however robust, in the permanence of peace under democratic rule could withstand the shock given to this faith by the war between Germany and France. At the period of its outbreak the passions of onlookers were keenly enlisted on one side or the other, and partisans of either combatant contended that the responsibility for the war rested exclusively on the rulers of the State to which their own sympathies were opposed. But the more the inner history of the war became known, the clearer it became that its *causa*

causans was the jealousy between the German and French nations, or, to speak more accurately, their desire of attaining respectively certain objects, to whose attainment the subjugation of the other was an essential preliminary. Of course the personalities of Prince Bismarck, of Napoleon III., and of others played a large part in the actual conditions of the war. But when France had set her heart on remaining the dominant military power in Europe, and when Germany had made up her mind to convert a confederation of sovereign states into a united empire, an armed conflict between the two countries had become inevitable at no distant date. The outbreak of such a war as this—due to no serious provocation on either side, possessing far less obvious justification than any of the dynastic wars of the 17th and 18th centuries, and hailed with enthusiasm by the voice of the two nations about to engage in mortal combat—was utterly irreconcilable with the theory that modern civilization, the advance of science, and the progress of humanity, had rendered an aggressive war a practical impossibility. If wars were to be waged in the future, as they had been in the past, whenever any State had an interest in aggrandizing its power or extending its territories at the expense of its neighbours, and saw a favourable opportunity for so doing, certain conclusions followed logically, whose weight no prudent nation could afford to overlook. The first of these conclusions was that any Power which was anxious to hold its own position and retain its own independence must be prepared to defend herself against any other Power, or combination of Powers, by whom she was likely to be attacked. The second conclusion was that if the leading States of the civilized world were to act upon the principle of extending their dominions or consolidating their power whenever they could do so with fair chance of success, any State which did not avail itself of every opportunity presented for aggrandizement without incurring serious danger of reprisals must of necessity fall behind in the struggle for life. It will be found, on examination, that both these convictions, in some instances consciously and, in many more, unconsciously, have influenced the course of events during the period under review. With respect to the first conviction, as to the necessity for increasing their military forces, there has been a marvellous accord on the part of all the leading Powers of the world. It is not an exaggeration to say that the chief occupation of the last twenty-five years of the 19th century, in as far as Governments were concerned, consisted in preparing for the possible eventuality of war. Reference to any record of national statistics will confirm this statement. For our present purpose it is sufficient to say that, in well-nigh every civilized country, the army and navy have been placed, in times of peace, on what at the commencement of the period in question would have been regarded as on the footing of war. All countries are burdened well-nigh to the full extent of their numerical and financial resources. Various minor States, such as Bulgaria and Servia, have been brought to the verge of bankruptcy by their military expenditure; and it is open to question how long even powerful countries such as Italy, Russia, and Austria can continue to support the constant drain on their resources caused by the necessity, whether real or imaginary, of making themselves ready for war in times of peace.

In the majority of instances these military preparations were honestly made for defence, not for defiance. But it is only in accordance with human nature that the possession of power should engender a desire for its exercise. The period of increased armaments has therefore coincided with a period of annexation on the part of all the powerful States of the world. To cite only the main instances, Great Britain has acquired a virtual protectorate over Egypt, and holds joint dominion with Egypt over the Sudan; has annexed Burma, the Transvaal, and the Orange Free State; and has secured a leasehold of Cyprus, tantamount to a freehold. France has taken possession of Tunis, and has assumed the administration of Indo-China—comprising the formerly independent States of Annam, Cochin-China, Cambodia, and Tongking. Russia has annexed Bessarabia and the northern provinces of Armenia. Germany has planted her flag on the mainland of Zanzibar in Africa and at Kiao-chow in China. Austria has possessed herself of Bosnia and Herzegovina. Italy has assumed the ownership of Massawa, and was only hindered from securing a protectorate over Abyssinia by the disastrous campaign which ended in the defeat of Adowa. Belgium, in fact if not in name, has added the Congo Free State to her European dominions. The passion for territorial aggrandizement has not been confined to Europe. In the East, Japan has obtained a footing in Korea, and would have extended her territory into China

proper after her victories in the war with the Celestial Empire had she not been baffled by the intervention of Russia, France, and Germany. In the West, the United States, as the reward of their war with Spain, hold Cuba within their grasp, and have actually annexed Porto Rico and the Philippines. We might cite any number of smaller acquisitions of territory—chiefly, no doubt, on the part of Russia and Great Britain—in barbarous or semi-barbarous countries; but it is unnecessary to do more than allude to the partition of Africa, one of the most striking illustrations of the earth-hunger which has had so great an influence on the course of events within the last few years, and which is likely to have far greater influence in the years to come. The Dark Continent, to whose existence, after the suppression of the slave trade, Europe had remained persistently indifferent, has since 1880 been partitioned out into so-called spheres of influence, over which various European States claim a right of predominance.

It may be contended with some plausibility that this earth-hunger is due solely, or at any rate mainly, to increased armaments, and to the bellicose frame of mind which these armaments have necessarily engendered amongst all progressive countries. This explanation, however, is inadequate.

The earth-hunger. Even the most ardent opponents of militarism would hardly dispute the assertion that, as a

body, the civilized nations of the world have increased their armies and their navies on the principle, *Si vis pacem para bellum*. The possession of augmented military power may have facilitated the subsequent annexations of territory. But the chief object for which the nations have submitted willingly to the burdens inseparable from so-called "bloated armaments" has assuredly not been solely an ambition of seizing on the waste places of the world. The truth is that the outburst of militarism has coincided fortuitously with what we may call the contraction of the earth. It need hardly be said that this contraction is moral, not material, and is due to the rapid increase of the world's population, owing partly to improved sanitary and social conditions, but mainly to the discoveries of science. If by some convulsion of nature the various inhabited portions of the globe could have been brought into close proximity to each other, the result of such a convulsion would hardly have differed materially from that produced by the agency of railways, steamships, and, above all, of electricity. Even as late as 1875 the system of world telegraphy was in its infancy as compared with its present development; and it seems well-nigh certain that the 20th century will witness such an extension of the means of international locomotion and communication as to induce succeeding generations to regard themselves, with far more justice than we can do to-day, as the heirs of all the ages. It is not to be wondered at if this contraction of the earth should have increased the desire of all leading nations to increase their area of available territory while there was yet time and opportunity. When the owner of a large and prosperous estate finds building going on all around him, in such a manner as to threaten "the amenities" of his property, he has only one course open to him if he is anxious to maintain his position. That course is to obtain possession of all adjacent land which is available for appropriation. The same instinct which leads the landowner to provide against the danger of being crowded out, has led the master nations of the day to appropriate, in as far as they can, all the unoccupied portions of the habitable globe. It is a significant fact that the two countries in which this land-greed has been most powerful should be Great Britain and Germany, which both have very dense and very rapidly increasing populations, and which are both to a considerable degree dependent upon foreign enterprise for the food of their people. In France, on the other hand, where the population barely holds its own in numbers, and where the produce of the soil is more than sufficient for native wants, the land-greed has taken but small hold on popular imagination. This statement may seem hard to reconcile with the vigorous though spasmodic efforts made by France since the Franco-German war to extend her spheres of influence in various parts of the globe. A very slight acquaintance, however, with the French people is sufficient to convince any observant person that Frenchmen know little and care less about colonial possessions in themselves, and only value them, if at all, from a sort of unreasoning impression that Great Britain owes her greatness to her colonies, and that if France had colonies of her own, she might become more powerful than Great Britain, or at any rate might cause that country trouble and annoyance.

Something may well be said here of the violent outburst of anti-British feeling which has manifested itself throughout Europe, and especially in France, and which forms one of the most noteworthy, though

least pleasing, incidents of the period under consideration. Be the rights or wrongs of the war between Great Britain and the Transvaal what they may, it is idle to imagine that the well-nigh universal condemnation passed upon the former abroad was due to any genuine sympathy for the Boers or to any other sentiment than jealousy. The head and front of British offending lies in the fact of the extraordinary success and unparalleled prosperity of the British people, and the same is to a great extent true of the Continental jealousy towards the United States of America. It is difficult for Britons who have not lived in foreign lands to appreciate the irritation caused by the mere existence of their empire. That the small islands forming the United Kingdom should be the centre of a world-wide dominion, that the British flag should float in every quarter of the globe, that the English language should be spoken, as the master tongue, in so many parts of the world, that the trade of the universe should be mainly in British hands, and that the wealth of Great Britain should so greatly surpass that of other nations, seems to the non-British mind a violation of the laws of nature, an outrage upon the principles of eternal right. The explanation that this success and prosperity are due to certain superior qualities of the British race is one which foreigners can hardly be expected to accept. A more simple and a far more pleasing explanation is afforded by the theory that British greatness is due either to sheer accident, or to a mixture in the British character of extreme selfishness and almost sublime duplicity. The world, for the most part, is convinced that Great Britain's proud position is a bubble, needing only to be pricked to disappear into thin air. The unexpected reverses of her troops at the outset of the war with the Transvaal seemed to foretell the probability of her collapse, and on that account the Boers commanded general sympathy. Of course there were exceptions. A few countries, and a minority of thinking men in every country, declined to admit that the Boers must be right because they were opposed to Great Britain. But if the questions at issue between the British Government and the Boer Republics could have been submitted to an international Court of Arbitration, or to a plebiscite of all Continental countries, no matter what might have been the intrinsic strength of the British case, the passing of an award in favour of the Boers would probably have been a foregone conclusion. If our explanation of the causes which practically ranged the nations of the European mainland on the side of the Boers, as the enemies of the British Empire, be admitted, it follows that whenever Great Britain is placed in a position of difficulty, she may count upon the sympathies of the vast majority of her neighbours being enlisted on the side adverse to British interests.

The recognition of this plain truth, unwelcome as it may be, has strengthened the growth of the Imperialist movement, which, in England at any rate, has been the most remarkable feature of the fourth quarter of the 19th century. There is no need to have reached an advanced age in order to remember the time when the formation of a Federated British Empire was regarded as an idle dream of Utopia. Till the days of the fourth Lord Carnarvon, no statesman had ever come forward as the champion of Imperial Federation; and even the Minister under whose auspices the Dominion of Canada became an accomplished fact was looked upon by his contemporaries as an amateur politician. The idea that the union of the scattered colonies of Great Britain beyond the seas could ever come within the domain of practical politics had hitherto met with no support from the leading statesmen of the Victorian era, whether Liberal or Conservative. Federation never formed part of the programme of either party—of the Liberals even less, if possible, than of the Conservatives. Why this should have been the case is obvious enough. In former days the first practical step towards the creation of an Imperial Federation was deemed to be the establishment of a Customs Union, under which all parts of the British dominions, wherever situated, or whatever might be the nationality of their inhabitants, should not only enjoy free trade with one another, but should be advantaged, as against foreign nations, by being subject to lower duties than those imposed on foreign traders. To take such a step, to however small an extent, was deemed an infraction of Free Trade principles; and up to a very recent period the theory that Free Trade was a system advantageous everywhere, at all times, and in all circumstances, was a cardinal tenet not only of the Manchester school, but of the whole Liberal party. Amongst the causes to which the progress of the Federation movement is due, the decline of popular faith in the universal application of Free Trade principles cannot fairly be overlooked. The chief cause, however, is beyond

doubt the advance in the use of telegraphic communication. Any system of common government between the mother country and the British colonies, other than that of a vague dynastic union, was manifestly impossible so long as communication between the parent State and her offspring was a matter of weeks or months. Of course, notwithstanding all the improvements in railway and steamship communication, the mileage distance between the mother country and her colonies forms a grave difficulty in the way of any possible Federation; but this difficulty nowadays is insignificant compared with what it was in 1875. Thanks to submarine telegraphy, any event of public interest which occurs in Great Britain is known at once in every important colony. In the same way, the main incidents of colonial life are read and commented on at home almost simultaneously with their occurrence. The variations of public opinion in Great Britain and in all the self-governing colonies of Greater Britain are discussed simultaneously in every part of the British Empire. Joint administration conducted by telegraphy cannot, for various reasons, be ever as satisfactory as joint administration by oral methods and personal intercourse. Still, the former system of administration is conceivably possible, while the latter is at present manifestly impossible. What, however, is even more important than the increased facility of communication between all parts of the British Empire is the extent to which this facility of communication has tended to weld Great Britain and Greater Britain into one people, with common thoughts, common interests, and common ideas. All families which have relatives settled in the colonies must be aware that, though mutual affections might remain undiminished, the interest in each other's fortunes felt by the members of a family, residing some at home, some in the colonies, tended formerly to decrease with the lapse of years. But when the papers report every morning to every British town of importance in each quarter of the globe the news of what has passed on the preceding day, whether in the mother country or in her dominions beyond the four seas, the common interest in each other's doings and sayings, which binds together men of the same race and country, is far less liable than it was heretofore to diminish in strength. To a great extent the British race, whether at home or abroad, has, owing to the advance in telegraphy, become again one community, united by other ties besides those of a common language and a common ancestry. We have seen how this rapidity of communication works in practice by the experience of the South African War. It needs no saying that the war would not have excited the intense sympathy displayed by the Colonies if the defeats, victories, sufferings, and triumphs, not only of the British army, but of the Colonial contingents, had not been made known to them day by day in the order of their occurrence. We must not seem to undervalue the military assistance afforded by these contingents, if we regard as a yet more important result the way in which this assistance has tended to strengthen the influences which work for Imperial Federation. There are grave practical difficulties which attend the formation of any working scheme for carrying out the idea of the Federation of the British Empire. But it is a striking fact that, for the first time in British annals, this idea has commended itself to popular favour both at home and in the colonies.

It has always seemed to the present writer that the political economists who contend that self-interest is the factor which determines national policy are equally in the wrong with the school who contend that sentiment—using the word in no offensive sense—is the mainspring of human action. It would be more correct to say that the world is governed by a combination of self-interest and sentiment, the relative power of each factor being subject to certain variations, but always tending to revert after each variation to a status of equality. Hostile critics would urge that the sentiment which supports Federation cannot last, as it is based on no foundation of self-interest. In our view this assertion is erroneous. The British colonies have manifestly an interest in Federation, on the assumption that it is essential to colonial independence and is calculated to facilitate a Customs Union. The working-classes in the United Kingdom have at the first sight no interest in a Customs Union, which they have been led to believe would not only violate the principles of Free Trade, but would raise the price of the articles they mainly consume. Of late, however, there have been indications that this belief is no longer so widely or so enthusiastically entertained as it used to be by the electorate of the mother country. The British working-man would be far more blind to his own interest than he is commonly supposed to be if he had failed to note the fact, that under unrestricted competition a number of British industries

have been shrivelling away, if they have not become absolutely moribund, which under a protective policy have gained ground in every leading foreign country. Market after market has been closed to British trade by the imposition of prohibitive duties abroad; and though the rate of wages has kept up, the fear that any falling-off in British industry may possibly lead to a general lowering of wages has for some time haunted the minds of labourers, mill-hands, artisans, and miners. This fear has afforded an opening of which the partisans of Imperialism have not been slow to avail themselves. They advocated the necessity of providing fresh markets for British industry, by fostering colonial development, by "pegging-out" new claims, by subsidizing enterprises calculated to bring the colonies into closer communication with the mother country, and by adopting the policy of Federation, of which Mr Chamberlain has been the most prominent advocate. If once the British working-classes get it into their heads, with or without reason, that a British Zollverein—the probable result of Imperial Federation—would conduce to the augmentation of their wages, or at any rate to the maintenance of the present rates of payment for labour, they would be led by self-interest to espouse the cause of Federation. The influence of self-interest would be augmented by the force of sentiment—of patriotism, Jingoism, or whatever one may choose to call it,—which is certainly not less powerful in the lower classes of British society than in the upper. It is significant that the most important legislative act of the last year of the 19th century should have been the passing of the Act authorizing the Australian Colonies to form themselves into an Australasian Commonwealth. Whatever may have been the case in Australia, this measure was deemed in the old country to owe its chief importance to the fact that it was regarded as an initial step towards the ultimate formation of an Imperial Federation embracing all parts of the British Empire.

The note of Imperialism was first heard in British politics at the commencement of the period with which we are dealing. It was in the last days of 1875 that Disraeli purchased for Great Britain the Khedive Ismail Pasha's interest in the Suez Canal, and thereby committed her to an intervention in the affairs of Egypt, which gradually eventuated, as all intervention is apt to eventuate, in the establishment of a virtual protectorate over the country in whose affairs the intervention was employed. A year later Queen Victoria, by Disraeli's advice, added to her titles that of Empress of India. In pursuance of the policy indicated by this change of appellation, the then Premier brought Indian troops to Europe in order to garrison Malta during the period when a war between Great Britain and Russia seemed to be on the cards in consequence of the invasion of Bulgaria by the armies of the Tsar. A further step towards the development of British Imperialism was taken in the attitude which Lord Beaconsfield adopted at the Berlin Conference, and by the convention he formed with Turkey, in virtue of which Great Britain obtained practical possession of Cyprus, and pledged herself to defend Asia Minor in the event of this portion of the Ottoman dominions being invaded by Russia. There can be no doubt that the acquisition of Cyprus was intended by its author to enable Great Britain to make Cyprus a *place d'armes*, and thereby to forestall any possible despatch of French troops to Egypt, and to protect the port of Alexandretta, which was to have been the terminus of the projected Euphrates Valley Railway to the Persian Gulf. Lord Beaconsfield's Imperialist policy laboured under two fatal defects; first, that owing to advancing years he was not prepared to carry it through, in the face of the active antagonism of his opponents and the lukewarm sympathy of his supporters; and, secondly, that the ideas which lay at the bottom of his policy had not yet appealed to public opinion at home. Indeed, popular sentiment, excited by the Bulgarian atrocities, had turned against any alliance with Turkey; and the result of Mr Gladstone's Midlothian campaign was the decisive defeat of the Conservatives at the General Election of 1880, and the return to power of the Liberal party under Mr Gladstone. For a time Imperialism was at a discount; indeed, it may fairly be said that to the end of his career the ideas which underlie Imperialism were distasteful to the great Liberal leader. But the force of events soon compelled a Liberal Government to resume the system of active intervention in foreign affairs, against which they had protested so warmly in the days of their predecessors. Two years after his accession to office Mr Gladstone had to send troops to Egypt in order to suppress the Arabi insurrection, to occupy Cairo, to abolish the Franco-British dual control, and to undertake the provisional administration of the country. We entertain no doubt as to the perfect good faith with which Mr Gladstone protested that the British

occupation of Egypt was not intended to be, and would not be, of a permanent character. It was not his fault if the logic of facts proved stronger than he had anticipated, and if the provisional domination of Great Britain in Egypt assumed, year after year, a character of greater permanence. The insurrection in the Sudan, the victories of the Mahdi over the Egyptian forces, the evacuation of the Sudan, to which Egypt was compelled to accede at the command of the British Government, the despatch of General Gordon to the Sudan to arrange for the withdrawal of the Egyptian garrison, and the subsequent investment of Khartum, compelled the British Government, sorely against their will, to send a British army to the Sudan in order, if possible, to effect the release of their envoy. Popular sentiment forced the hands of the Ministry, and resented the withdrawal of the Wolseley expedition, then almost within sight of Khartum, on learning that Gordon had already succumbed to fate. The force of this sentiment made itself manifest at the elections of 1885. Of all the baseless calumnies which have been brought against Great Britain abroad, the most baseless is the charge that her action in Egypt was dictated by a deliberate desire and purpose to establish British supremacy in the valley of the Nile. Having been conversant with Egyptian affairs for many years, and having been personally, and in many cases intimately, acquainted with the leading personages, native as well as foreign, in Egyptian public life from the date of the opening of the Suez Canal, the present writer can declare with confidence that until a very recent period British policy in Egypt was based on a genuine and honest, though, as he holds, a mistaken desire to quit Egypt and to get rid as soon as possible of the liabilities inseparable from military occupation. This desire was not a matter of party feeling. It was shared alike by Liberals and Conservatives; and if the British are still in Egypt, this is only in obedience to that manifest destiny which shapes the history of nations, and which in the case of Great Britain compels her to pursue her Imperial mission. In a similar way the Jameson Raid, which was undertaken without the knowledge, and most assuredly against the wishes, of either the Government or the people of Great Britain, placed that country in a position which forced her most reluctantly to go to war in order to protect her Imperial interests. Everybody who has studied the history of Great Britain is aware that wars of conquest have been of very rare occurrence in her annals. The story of almost all her acquisitions of territory has been substantially the same. The instincts of their race have led British subjects to settle in far-away lands, from desire of trade or adventure. The settlers have acquired interests in the countries where they have taken up their abodes, and these interests have been assailed either by the natives or by foreigners. Great Britain, as a trading nation, has had no choice except to protect the interests of her traders abroad. Wars have ensued; territories have been annexed for the protection of trade; and, finally, the mother country has had to step in and place the territories in question under her rule and sway. In other words, the British Empire has been welded together, not in virtue of any distinct policy, but in obedience to the exigencies of its position as the chief trading nation of the world. It has grown unconsciously, not been created consciously. If this fact gives greater promise of permanence, it also renders the limitation of the British Empire a matter of extreme difficulty. The founders of empires created by conquest can in most cases say, "Thus far and no farther." But so long as the causes which have brought the British Empire into existence continue in full force of action, Great Britain has not the power, if she has the will, of altering her policy. We have dwelt at length on the development of British Imperialism because we regard it as the most important incident of recent years not only in regard to Great Britain, but in regard to the world at large; but the same note of Imperialism has influenced the policy of all the leading civilized nations of the world throughout the period under review.

The Latin proverb *Inter arma silent leges* applies with especial force, though not perhaps in its literal sense, to this period of militant Imperialism. There has been a lull in the department of constitutional legislation. In Great Britain the only measure of grave constitutional importance was the passing in 1885 of the Bill establishing Household and Lodger Suffrage in the counties. The measure in question was the logical corollary of the "leap in the dark" taken under Lord Derby's premiership in 1868, by which a system approximating very closely to adult manhood suffrage was established in the boroughs. The Liberals, by all the traditions of British party warfare, were bound, in

**Legisla-
tion.**

sporting phrase, "to go one better" than the Conservatives; and the responsibility for the reforms under which, for the first time in British history, supreme electoral power was entrusted to the hands of the most numerous, the poorest, and the least educated classes of the community, rests, for evil or for good, on the shoulders of both parties alike. So far the new agricultural franchise has told in favour of the Conservative party. In 1886, in 1895, and again in 1900, the constituencies returned large Conservative majorities. As long as the attention of the country is occupied with foreign or Imperial questions, or with issues not bearing, except indirectly, on labour and its relations to capital, the voice of the working-class electorate is likely, in normal circumstances, to be in favour of the Conservative party. Equal confidence is not possible as to what may be the result when foreign or Imperial questions may be in abeyance, and when party questions are raised on one side or the other involving the acceptance or rejection of legislation calculated, in the opinion of the working-class electorate, to affect the real or supposed interests of Labour as opposed to Capital.

The British Parliament, for the last quarter of the 19th century, has been mainly occupied with the irrepressible Irish question. In its vicissitudes were included the commencement of the Fenian outrages, the Prevention of Crimes Act, the Irish Land League, the assassination of Lord Frederick Cavendish in the Phoenix Park, the formation of a united Irish parliamentary party under Mr Parnell, the attempt to obstruct all legislation at Westminster by an abuse of the rules of the House, the enactment of the closure, the coalition between the Liberals and the Irish Nationalists, the introduction by Mr Gladstone of a Bill for the Repeal of the Union, its rejection owing to the secession of the Liberal Unionists, the Pigott trial, the downfall of Mr Parnell, the disruption of the National party, and the rejection of Mr Gladstone's second Home Rule Bill by the House of Lords, followed by his final retirement from public life. Great as was the interest caused by these events at the time of their occurrence, it may be doubted whether they modified materially the relations between Great Britain and Ireland. Their chief result was to show that the proposal to confer legislative independence upon Ireland excited little sympathy, and still less enthusiasm, among the British working class, and tended, in so far as they had any effect at all, to range them on the side of the Unionist party. The statement made by Lord Rosebery on his accession to the Premiership in 1894, to the effect that Home Rule could never be carried till the measure had commended itself to the opinion of the "predominant partner" in the Union, though it was afterwards explained away by its author, was approved by the good sense of the British public, and there seems as yet no prospect of any change of popular sentiment in England or Scotland with reference to the inexpediency of any repeal of the Union, under which the United Kingdom has grown in strength and prosperity. In other respects the political machinery of the United Kingdom underwent but slight change during the last quarter of the 19th century. But the reaction against "democratic" Liberalism has been conspicuously shown by the popular acquiescence in the apparent decline of the power of the House of Commons as such, and the concomitant increase in the power of the Cabinet. Very much the same significance must be attached to the fact that, in spite of the extension of the suffrage, and the multiplication of elections for local government, the main feature of the elections has always been the prevailing apathy of those entrusted with the privilege, or duty, of voting, and the comparatively small proportion of the electorate which is sufficiently interested to go to the poll.

In France, where constitutional changes are matters of far more common occurrence, the position remains much the same as it was on the downfall of the Second Empire after the surrender of Sedan. The Third Republic has remained in power for a longer period than any *régime* which held sway in France during the 19th century. The great majority of the present generation of Frenchmen have been brought up under Republican institutions, and it is only a comparatively small and rapidly diminishing minority which can have any personal recollection of either Empire or Monarchy. Moreover, the deaths of the Comte de Chambord, the Comte de Paris, and the Prince Imperial removed the only representatives of the deposed dynasties who appeared likely to have any hold on French popular sympathies. In these circumstances, it would seem antecedently probable that the Republic should have taken firm foot in French soil. So far, however, this anticipation has not been realized. The French Republic, as it has existed since 1870, is a parliamentary government; and this form of

*European
develop-
ments.*

government, though in accordance with the political ideas and aspirations of Anglo-Saxon races, is, as the present writer ventures to think, incompatible with the opinions and ambitions of nations of Latin race. Be this as it may, the Third Republic has excited little or no enthusiasm in France. It is tolerated in default of any more congenial form of government, but it does not command the confidence or respect of its citizens. The absence of any statesmen of high eminence since the decease of Thiers and Gambetta, the Panama scandals, the hostility between the Church and the civil power, the Anti-Semitic agitation, the dread of Communism by the *bourgeoisie*, and the animosity against the employers of labour, which prevails so widely amongst the operatives and artisans, may all be cited as causes why the parliamentary rule of the Republic has not commanded popularity. That the Republic is still on its trial is patent from the fact that its safety was seriously imperilled by the appearance on the stage of politics of such a feeble antagonist as General Boulanger. It is commonly acknowledged in France that any general who might lead a French army to victory in a European war would be master of the situation in France. It is on this account that the civilian Ministers of the Republic, no matter to what party they belonged, have been unanimous in deprecating any external war. It is on this account, too, that of late the French Ministry have made various overtures to the Socialist party, and have even admitted into their ranks colleagues who are associated with the traditions of the Commune. Moreover, the Franco-Russian alliance, however little practical benefit it has as yet conferred upon France, has undoubtedly gratified French national pride, while the fear of shipwrecking the fortunes of the Exhibition of 1900 paralysed all revolutionary agitation for the last two years of the century. Nevertheless, the position of the French Republic remains, as in 1875, one of unstable equilibrium.

In Germany, politically speaking, things have undergone but little external change. The first emperor of a united Fatherland was succeeded, after the brief reign of his son, Frederick III., by his grandson William II. Prince Bismarck was dismissed and died; but the constitution of the empire remains substantially unaltered, and may perhaps best be described as a parliamentary government under which the Sovereign is his own Prime Minister, and is still the supreme authority in the State, not only in name but in fact. How far this state of things is likely to be permanent is an open question. As things are, the high character and ability of the Kaiser, the prestige of the Hohenzollern dynasty, the traditions of German history, the power of the military element, and the popular distrust of France, confer upon the head of the State an influence far beyond that possessed by the Parliament; and so long as this influence is exerted firmly and wisely, as it has been in the main under the reigning emperor, it is not likely to be materially diminished. At present the German Parliament exercises a sort of general control, of which even an autocrat has got to take account; and there are not wanting indications that parliamentary government in Germany may be more of a reality in the near future than it has been in the past. But so long as Germany, in the opinion of the German people, is threatened by the possibility of a hostile coalition between France on the west and Russia on the east, the conflict between the supremacy of the Parliament and the Crown is not likely to assume an active character. The great material progress made by Germany under the Empire has turned the thoughts of her citizens rather to industrial enterprise than to political reform. The trade interests of Germany, combined with her national pride, have led her to support a policy of colonial extension and, as a necessary corollary, the formation of a powerful navy; while the disputes between the Agrarian and the Free Trade parties on the one hand, and between the ecclesiastical and civil authorities on the other, have excited little beyond local and sectarian interest.

In Austria the Triple Alliance has secured many years of peace, and has afforded an opportunity for the consolidation of her heterogeneous provinces. The opportunity, however, has not been improved, as there seemed reason to expect, by the extension of parliamentary institutions. Ever since the premature collapse of Count Rechberg's scheme for the creation of a national Parliament, in which every province under the rule of the House of Hapsburg was to be represented on equal terms, and whose authority was to be supreme throughout the empire, the process of internal disruption has made rapid progress. This process commenced when Hungary, on the recovery of her independence after Sadowa, declined to entertain any proposal for fusion with the other provinces of the empire, and insisted on the possession of a separate legislation, a separate Ministry, and a separate Executive. The example thus set was soon followed by the

various nationalities of the Empire of other than Teutonic race. The Czechs, the Croats, and the Italian population of the Adriatic littoral have all set up claims to legislative independence. The Germans of Austria proper, who form the backbone of the empire, have resented these claims as an infraction of their supremacy. If Hungary had been represented in a common Parliament at Vienna, the Hungarians and Germans could have formed a majority strong enough to overrule the representatives of the Slav and Latin nationalities. As it is, no Austrian Ministry since 1880 has succeeded in commanding the support of the Parliament except by concessions to one race or another, which tided over a temporary difficulty, but left the problem of Austrian reorganization more complicated than it was before. The system of wanton obstruction adopted alike by Czechs and Germans, the coalitions between the Anti-Semite Liberals and the Clerical Conservatives, the virulence of the personal attacks made indiscriminately by every party in the Reichsrath, the constant fluctuations in ministerial policy, and the rapid succession of one Ministry after another—have all combined to discredit the system of parliamentary institutions in Austria, until the very existence of constitutional government in the Austrian half of the dual Monarchy is at stake. The personal esteem and affection entertained towards the Emperor Francis Joseph by all his subjects have given him an authority which no successor is likely to inherit, but no observer is able to contemplate without apprehension what may happen when his guiding hand is taken away.

In Italy, though from different causes, parliamentary government can hardly be said to have proved a success. The generation of statesmen of eminence possessed by Italy during the period of her unification has passed away and left but few successors. Owing to the influence of the Vatican, the wealthy classes have, as a body, abstained from public life; and political power has fallen, in consequence, to the lower class of professional men, who look to a seat in the Chambers as a means of livelihood. The amalgamation, however, of the various provinces of the peninsula into one united kingdom has proved a less difficult task than was anticipated at the outset. The composition of the Italian Chambers has without doubt contributed largely to the mal-administration of public affairs, which within the last few years brought Italy to the verge of bankruptcy. But it may be doubted whether a differently constituted Parliament could have enabled Italy to bring her expenditure within her income. The Triple Alliance was joined by Italy in order to procure protection against intervention in Italian affairs on the part of the French Republic, an intervention which in 1887 was regarded as imminent, and which is still looked upon by Italians as likely to occur whenever France has a free hand. Adhesion to the Kaiser-Bund necessarily involved the keeping on foot of a standing army large enough to render the military assistance of Italy useful to Germany and Austria in case of need; and the maintenance of such an army could only be met either by extravagant borrowing or by exorbitant taxation. The tendency to reckless expenditure was increased by the demand for railways and other public works, deemed necessary for the development of the great resources of the kingdom, and also by the natural desire of the Italians to assert their position as a great Power, a desire which gave rise to the disastrous war with Abyssinia. When the borrowing powers of the country were exhausted, the deficit caused by the service of the public debt and the extravagant cost of the administration had to be provided for by an increase of taxation, which told heavily on a population already overburdened in comparison with its resources. The result has been to strengthen the Republican party in the Peninsula, a party which, being closely connected with the French Socialists, entertains the belief that under a Republic Italy would have no cause to fear any interference with her independence on the part of France. The Church in Italy has done all in her power to throw discredit upon the system of representative government, which in her opinion presents an insuperable obstacle to any restoration of the temporal power of the Papacy. The net outcome of this state of things is that though the Italians are as determined as ever to uphold their national unity, they are not as convinced as their forefathers were that this unity can only be secured by parliamentary rule. With a young and inexperienced sovereign upon the throne the general outlook for Italy was not, at the opening of the new century, as encouraging as her friends could desire.

In Russia the autocratic system of government remains unaltered. The agitation on behalf of parliamentary institutions has made little apparent progress. The parliamentary idea has never as yet taken hold on the *Moujiks*, who, in so far as they give any attention to politics, seem to prefer the

autocratic rule of the Tsars to any other form of government; while the middle classes, who at one time favoured the constitutional agitation, have been alienated by the excesses of the Nihilists. Meanwhile, whether under Alexander II., Alexander III., or Nicholas II., the policy of the Russian Government has been directed almost exclusively to the consolidation and extension of the Empire. The first object has been advanced by the incorporation of the Baltic provinces; by the suppression of the independence guaranteed to Finland on her annexation just a century ago; by the wholesale persecution of the Russian Jews, due not so much to religious prejudices, as to a conviction that any separate racial nationalism impairs the homogeneity which Russia thinks is expedient should prevail throughout the length and breadth of the Tsar's dominions; and by the gradual destruction of every element in Poland which stands in the way of her permanent Russification. The second object has been pursued by the wars waged on behalf of Serbia and Bulgaria,—which, whatever else they have achieved or failed to achieve, have resulted in largely increasing Russian authority throughout the Balkan Peninsula,—by the campaign against the independent Khanates in Eastern Asia, and by the construction of railroads which have practically made Russia the ruler of all the vast Northern area extending from the Baltic to the Pacific. A policy of this kind is only possible under an absolute autocracy. The experience of history teaches us that in empires, as in oceans, the tide must turn sooner or later, but during the period of which we write the tide of Muscovite aggrandizement has been flowing steadily in the same direction, and as yet there seems no sign of its receding.

In the United States of America a tendency towards what, for lack of a better word, we have called, in Europe, Conservative reaction has influenced the legislation of the years between 1875 and 1902.

United States. It was in the first named of the above years that the popular outcry against Chinese immigration into the Western States assumed an active form. The resolution to prohibit the entry of Chinese labourers into the Union, which was formally embodied in a Bill passed by Congress in 1888 under Mr Cleveland's presidency, may have been justified by local considerations. But it was a distinct violation of the fundamental principle, that the territory of the Great Republic was open "to the meanest of Adam's kin." In like manner, popular jealousy of foreign competition may have had no small share in securing the enactment, two years later, of the highly protective duties on foreign imports recommended by Mr McKinley. From the earliest days of the Republic it had always been accepted as an axiom of State policy, that the United States were not to intervene in any way in affairs lying outside the American continent, and as a necessary corollary of this axiom, it was also held that the possession of colonies or foreign dependencies that would not ultimately become states in the Union was prohibited by the spirit, if not by the letter, of the Constitution. In foreign affairs up to a recent period non-intervention was the dominant principle of the administration, no matter which party might be in power. But during the last few years this principle has been openly disregarded. Whatever view may be taken of the war with Spain, there is no disputing the fact that its outcome, as seen in the acquisition of foreign territory, especially in another hemisphere, was inconsistent with the theory of the Constitution held by the founders of the Republic. A series of decisions of the United States Supreme Court in 1901, delivered in cases that had originated in the collection of customs by the revenue officers upon imports from the Philippines, Porto Rico, and Hawaii, gave legal form and substance to the colonial idea. These decisions, which (it should in fairness be stated) were made by a bare majority of the Court, held that the new possessions were not within the clause of the Constitution which provides that "all duties, imports, and excises shall be uniform throughout the United States," the Court holding that, as here, "territory belonging to the United States" is not necessarily a part of the United States, and entitled to the same rights and privileges as the territory of the individual States composing the Union. In other words, a place is definitely made for colonies under the Constitution where many had thought no such place existed, and their government and treatment are thus entrusted solely to the legislation of Congress, under the clause of the Constitution which provides that "the Congress shall have power to dispose of and make all needful rules and regulations respecting the territory or other property belonging to the United States." Thus public sentiment and judicial interpretation alike have accepted the new state of affairs which has made America a colonial power.

The political transformation of Japan is of too recent a date for any trustworthy judgment to be formed as to its character, and still less as to its permanency. At the outset the revolution replaced the titular sovereign upon the throne, and was followed by the destruction of the feudal system under which the Tycoons had for nearly eight centuries governed Japan as a sort of Eastern *Japan.* "Mayors of the Palace." The restoration, therefore, of the spiritual emperor seemed calculated to bring about the revival of the old autocratic system of rule. As a matter of fact the revolution has turned out to be only the prelude to the creation of a Constitutional Monarchy, formed after the fashion of the Western world. Within the course of the years which have elapsed since the deposition of the Tycoon, Japan has been converted into a civilized, progressive, self-governing commonwealth of the European type. During this period post-offices, railways, telegraphs, ironclads, weapons of precision, things hitherto unknown, have been introduced into the Japanese Empire. Primary schools, compulsory education, the use of the European alphabet and of Roman characters, freedom of the press, religious toleration, vote by ballot, party government, and well-nigh all the mechanism of European administration have been adopted by the subjects of the Mikado, who is still supposed to rule in virtue of his spiritual supremacy. The original Assembly, nominated in 1875 by the Mikado, has now been changed into a popular Parliament freely elected by the people. It is difficult to avoid a doubt how far the Japanese have imbibed the spirit, as well as adopted the forms, of constitutional government. Still, it must be said that in the course of a period so brief as scarcely to count in the history of a nation, they have not only made immense material progress, but have developed a spirit of individual nationality which augurs well for their future. Japanese youths have been sent to all parts of the civilized world, to study the languages, the armies, and the industries of every important nation. Foreign instructors have been brought into Japan; but their services have as a rule been dispensed with as soon as their pupils had acquired sufficient knowledge to impart it as teachers to their fellow-countrymen. The motto of Japan might well be that of Italy in the Garibaldian era, *farà da se*. The progress of Japan has already induced the European Powers to forgo the right, guaranteed by the capitulation treaties, of having their subjects placed under consular jurisdiction. Finally, Japan's recent participation in the expedition of the Allied Powers for the rescue of the Ministers besieged in Peking has raised the island empire of the East to the level of a Power of which account has to be taken in all international questions; and this position was finally confirmed by the alliance between Japan and Great Britain at the opening of 1902.

It is sometimes said that all these questions of what—for lack of any exactly equivalent English term—may be best called *la haute politique*, do not interest the labouring classes, who under the general democratic tendencies of our time are gradually acquiring more and more political influence, and who in England, the United States, and the British self-governing colonies are practically *The labouring classes.* supreme whenever they choose to exert their power. But this, though true in regard to a bygone time, is at the best only a half-truth nowadays. The spread of education, the wider, even if superficial, acquaintance with foreign affairs created by the cheap press, the abolition of caste privileges, and the tone of modern thought, have all tended to render the civilized and self-governing nations of the world more homogeneous than they were wont to be. The sentiment of national pride is far more widely diffused, if not absolutely keener, nowadays than it was in bygone times. In consequence, popular opinion, whether intelligent or otherwise, plays a far larger part in public affairs than it did formerly. The result of this changed state of things must be to render the ideas which underlie Imperialism more intelligible and acceptable to the classes who live by manual labour than they were when the 19th century came into existence. Moreover, these classes are beginning to realize that their personal interests as wage-earners may be indirectly affected by questions of foreign or Imperial policy. Still, it may be fully admitted that, as a rule, questions which directly affect the sons of toil are those most calculated to enlist their sympathies. The so-called governing classes have already begun to take this fact into account, and to modify their tactics accordingly. During the discussions on parliamentary reform Lord Palmerston is reported to have replied to a friend, who remarked that in the reformed Parliament Ministers and members were much of the same class as they had been in the

pre-Reform era: "Yes, the actors will be the same: the only difference will be, that they will play to the gallery instead of to the stalls." Careful students of politics will probably agree that the legislation of the last twenty-five years has been largely influenced by what may fairly be described as "playing to the gallery." This tendency has been most marked in Great Britain, owing to the simple fact that the working-man's vote is, electorally speaking, more powerful there than it is elsewhere. The remedial legislation of Mr Gladstone with regard to Ireland, whether sound or unsound, was a distinct violation of the rights of property and of freedom of contract. The system of County Councils, by which local authority was transferred from the hands of the landed gentry to Boards elected in the main by artisans and labourers; the appointment of a Government Commission authorized to determine the rent payable on any Irish estate by an arbitrary process, instead of by open competition; the substitution of State administration in domains hitherto left open to private enterprise; the preference shown in all fiscal arrangements for direct, as opposed to indirect, taxation; the interference with the liquor trade; the agitation against ground rents and in favour of the principle of betterment; the obligation placed upon railway companies to provide working-men's trains at arbitrarily fixed rates; the measures adopted to provide improved dwellings for the working classes at rentals lower than could be obtained by leaving the construction of such dwellings to be regulated by the laws of supply and demand; the attempt to suppress usury by regulating the rate of interest the lender might be entitled to charge and the borrower might be bound to pay—may be cited as a few of the measures which would never have been adopted if the working-class vote had not become of paramount importance. We express no opinion as to the wisdom or unwisdom, the justice or injustice, of these measures. Both parties, Liberals and Conservatives alike, are responsible for the principle that legislation must henceforward be in favour of the masses rather than of the classes. It is only fair to acknowledge that, so far, the working classes have exercised their power with moderation. On the other hand, strikes have increased in number and in effectiveness. These disputes, almost without exception, have been initiated by the workmen, either to demand an increase of wages or to protest against a proposed diminution of wages. If the aggregate loss occasioned by these interruptions of labour could be ascertained, it would be found to exceed by far any gains that individual trades may have derived from successful strikes. A demonstration, however, that the blank tickets in a lottery far exceed in value the winning prizes has never stopped the public from investing in lotteries; and the fact that in the long run strikes are a losing business for the workmen will never deter Trades Unions from resorting to industrial warfare. The modifications of the Anti-Combination laws have facilitated the promotion of Trades Unions, and the material condition of the working classes has beyond doubt improved in all trades which have been able to form powerful labour organizations. It may be questioned whether wages would not have risen without Trades Unions, or whether the purchasing value of wages to-day corresponds with their nominal rise. Still, the broad fact remains that under Trades Unions British workmen earn a larger wage than they did in an older and freer era; and the probability seems to be that these trade organizations will in coming years become even more truly representative of the body of working men than they are at present. The doctrine of a "living wage," which has gained much ground during the period under consideration, is manifestly unsound in the form it has taken, as it is obvious that no business can be carried on permanently at a loss occasioned by an excessive cost of labour, while it is by no means equally obvious that labour would not be forthcoming for a lower remuneration than that actually demanded on the score of the real or supposed necessities of the labourers. The idea so prevalent in the days of the Christian Socialist school, that all labour difficulties could be solved by a system of co-operation, has been dispelled by the discovery that co-operation, as between capital and labour, means, when tested by experience, that the latter has the right to share in the profits when trade is good, but is unable to contribute towards the losses when trade is bad. The craze for compulsory arbitration in all labour disputes is equally fallacious, owing to the circumstance that no court of arbitration, however constituted, can compel capitalists to carry on mills, mines, or factories at a price they do not deem remunerative, or can coerce workmen into working for a wage they hold to be insufficient for their needs. In the future, as in the past, all trade disputes must be ultimately settled on the "pull devil, pull baker" principle, by strikes on the part of the men

and lock-outs on the part of the masters. We may reasonably hope that the folly of unnecessary conflicts between labour and capital will commend itself more strongly to all classes of the community, but the *ultima ratio* in industrial, as in all other disputes, must consist in an appeal to the relative strength of the two contending parties. Apart from the agitation for an eight hours' day of labour; there is no evidence of any decided Socialist tendency on the part of the working classes in Great Britain. This may be attributed to certain very obvious causes. The first is, that under British laws and ideas the artisan enjoys an amount of independence and freedom without a parallel in other European countries, and in many respects in excess of that possessed by his class in the great Republic of the West. The second is, the extraordinary strength of the social organization in England, which almost precludes any revolutionary action on the part of the labouring classes, except at periods of intense popular excitement. The third and the most potent is, the strong desire of the individual in English society, no matter what his position in life may be, to rise into a class superior to his own. The attainment of this desire is facilitated by the fact that any man of intelligence and energy can force his way from a humble origin to a comparatively exalted position. In consequence, the very men who otherwise, by virtue of their strength of will and character, would become class leaders, end as champions of the established social order. No other explanation accounts for the almost complete absence in recent times of any English leader of the proletariat who has risen to high note even amongst his own class. A similar remark applies, though with less force, to the working classes in all other communities of English race and origin.

On the other hand, the growth of the Socialist party in almost all continental countries cannot but be regarded as a marked feature in the period to which the foregoing remarks have reference. In Germany, in spite of—possibly in consequence of—repeated legislative attempts to suppress *Socialism* by force, the idea of founding a new social system on the negation of the right of *and* the individual to hold private property has made rapid progress. The Socialists have now *Anarchism*. become a powerful party in the Reichsrath, and at each election have been returned in increasing numbers by Berlin and the other large industrial centres of Germany. In Austria the Socialist-Anti-Semite coalition has reduced parliamentary government to a nullity. In France the Socialists have compelled the Government to carry out legislation based on communist ideas, especially with regard to labour disputes between employers and workmen. In Italy the Socialist movement has assumed proportions which seem to threaten the permanence of a monarchical form of Government, while in Russia they appear to have become the mainspring of all the Anti-Autocratic movements. In fact Anarchism and Nihilism owe their origin to Russia, and date their active existence from little more than a quarter of a century ago, when the Nihilist creed was propounded by Bakounine. Nihilism, in so far as any distinct opinion as to so nebulous a creed can be formed, is a repetition of Hamlet's saying, "The time is out of joint," supplemented by the corollary that the only way "to set it right" is to destroy all existing institutions—social, legal, or political. Logic would lead the holders of this creed to the conclusion that if the Creation has proved a hopeless failure, mankind would do wisely to terminate by universal self-immolation an experiment which has failed. Human nature, however, even amidst Nihilists, is never rigidly logical, and the adherents of this faith of despair are still sufficiently human to cherish the idea that if they could only get rid of the present social organizations they could call into being a new earth, if not a new heaven. The way by which this transformation is to be effected is by a series of outrages so appalling as to shake society to its very centre. The present writer's own observation of Russia, before even the name of Nihilism had become familiar to Western ears, led him to the conclusion that the colossal Empire of the North was an ideal soil for the growth of all insane revolutionary passions. In no part of the world is the contrast between the gorgeous luxury of the rich and the sordid, squalid misery of the poor so flagrant. Nowhere else are the material conditions of existence so hard for the masses; nowhere is the line of cleavage between wealth and poverty cut so sharply. In Russia there may be said, in comparison with the size of the population, to be no middle educated class; and in as far as such a class exists at all, it consists mainly of Germans and Jews. If this view is correct, it is not difficult to understand why the crudest theories and the most extravagant of beliefs should find a following in the dominions of the Tsar. No wish to extenuate in any way

a series of crimes which during the latter years of the 19th century have shocked humanity is conveyed by the admission that in Russia the outrages of Anarchism may to some extent be accompanied by not ignoble aspirations, and palliated in a degree by the wretchedness of their perpetrators. If Anarchism were confined to Russia there might be ground to hope that this form of mania might disappear as rapidly as it has arisen. Unfortunately the disease has spread all over the mainland of Europe, and has not only reached British shores in the form of the Fenian outrages, but has crossed the Atlantic and found a domicile under the Stars and Stripes. The explanation of this state of things possibly is that the conditions under which Anarchism sprang up in Russia exist, though in a far smaller degree, in all civilized communities. The inequalities of human existence, the contrast between wealth and poverty, the conflict between capital and labour, cannot fail to create a morbid state of mind amidst individual members of the classes which have not drawn prizes in life's lottery. Discontent with the established order of things is pardonable enough. But when discontent develops into outrages on innocent individuals, whose sole offence is that they hold higher stations or are wealthier than their fellows, discontent becomes a crime, and must be crushed in the interests of civilization. Anarchism has driven the great mass of the middle class in all civilized countries to look with suspicion on all popular agitations, and this change of sentiment has been one of the main causes of the Conservative reaction which we consider to have been the distinguishing feature of recent history.

To those who are old enough to remember the earlier days of the Victorian era, it is not altogether pleasant to note how many of the ideas and sympathies which held sway at that period have disappeared from want of sustenance, just as plants die for lack of water. It may be worth while to recall *Vanished illusions.* a few of these dispelled illusions. Where is now the cult of foreign patriots? If any successor to the mantles of Kossuth, Garibaldi, Schamyl, Ledru Rollin, or Mazzini were to appear in England, he would be received with absolute indifference, or handed over to the police. If Dr Bernard were placed upon his trial nowadays, not all the successors of the late Mr Edwin James at the bar could secure his acquittal by the verdict of a London jury. Where is the amiable belief that self-government under parliamentary institutions was a sort of universal panacea applicable to all countries at all times? Some words used by the late Prince Consort during the Crimean campaign, to the effect that representative government was on its trial, raised a tremendous outcry at the time of their utterance. If His Royal Highness had stated that the Ten Commandments were open to criticism, he could hardly have been exposed to greater animadversion. But the parliamentary system no longer excites the admiration it formerly obtained, and even Englishmen as a body have drifted back towards the belief of their forefathers, that the system works well in England, but not equally well elsewhere. Again, why are we reminded no longer that "the schoolmaster is abroad"? Since 1870 England has had as good a system of universal compulsory elementary education as British statesmanship could devise, but the most ardent educationalist would probably not deny that the results of the Board Schools have not fulfilled the expectations entertained at their inauguration. The public at large have ceased to accept the doctrine that mental instruction is the one thing needful to raise the moral, intellectual, and material status of the masses. No doubt popular enthusiasm on behalf of popular education has been impaired by the expense of the School Boards and by the extent to which the "Educational Parliaments"—to use the phrase of a bygone day—have disregarded the limitations placed upon their functions as the purveyors of elementary education. Still, the cost of the Board School system would have been overlooked if the public had not learnt to distrust the theory on which the system was founded. The education acquired in virtue of the Act of 1870, whatever its other defects or shortcomings, has no doubt made the British people much more of a newspaper-reading community than they were previously, and has thereby rendered them better citizens and more ardent patriots. But a conviction that this is so does not suffice to restore the enthusiasm with which popular education was regarded at the time of its introduction into England on the eve of the Franco-German war.

ENCYCLOPÆDIA BRITANNICA

NEW VOLUMES.

AUSTRIA-HUNGARY.

GEOGRAPHY AND STATISTICS.—1. *The Whole Monarchy.*

THE Austro-Hungarian monarchy consists of two states: the "kingdoms and lands represented in the council of the empire (Reichsrath)," unofficially also called Austria (Austria proper); and the "lands of St Stephen's Crown," unofficially called Hungary. Austria proper is composed of seventeen "lands," called also "Crown lands." Of these, three—namely, Bohemia, Galicia and Lodomeria,

Gradiska and Tirol—counties raised to principalities (*gefürstete grafschaften*); two—Moravia and Istria—margraviates (march counties). Vorarlberg bears the title simply of "land." Trieste, with its district, is a town treated as a special Crown land. For administrative purposes Trieste, with Görz-Gradiska and Istria, constituting the Austro-Illyrian coast land, and Tirol and Vorarlberg, are each comprehended as one administrative territory. The remaining lands constitute each an

administrative territory by itself. The "lands of St Stephen's Crown" are composed of—(1) the kingdom of Hungary, with which are incorporated the former grand-principality of Transylvania (Siebenbürgen), and a part of the military frontier; (2) the kingdom of Croatia-Slavonia, to which belongs the former Croato-Slavonian military frontier; and (3) the town and district of Fiume. By the Berlin Treaty of 1878 the principalities of Bosnia and Herzegovina, owning Turkey as suzerain, are placed under the administration of Austria-Hungary; while Austrian garrisons are stationed at three points in the Turkish sanjak of Novi-Bazar.

Area and Population.—The areas and the populations, according to the censuses of 1880 and 1890, of

Administrative Territories.	Areas in English Miles.	Population in 1880.	Population in 1890.

and Dalmatia—are kingdoms; two—Lower and Upper Austria—archduchies; six—Salzburg, Styria, Carinthia, Carniola, Silesia, and Bukovina—duchies; two—Görz-

the different administrative territories are given in the accompanying table. According to the census of 1900, the population of Austria was then some 26,120,000;

that of Hungary in the middle of 1898 was 18,862,269 ; so that the total population of the whole monarchy at the end of 1900, on these results, aggregated about 45½ millions. The number of inhabitants to an English square mile in 1890 was, in Austria, 206 ; in Hungary, 140. The average yearly increase of population in Austria from 1869 to 1880 was 0·87, from 1880 to 1890, 0·76 per cent., and from 1890 to 1900, 0·94 per cent. ; in Hungary, from 1869 to 1880, 0·13, and from 1880 to 1890, 1·09 per cent. In Bosnia and Herzegovina, the number of inhabitants to an English square mile was 81, and the average yearly increase (1885-95) 1·7 per cent.

Government.—The present constitution of the Austro-Hungarian monarchy is based on the Pragmatic Sanction of the Emperor Charles VI. of 19th April 1722, whereby the succession to the throne is settled in the dynasty of Hapsburg-Lothringen, descending by right of primogeniture and lineal succession to male heirs, and, in case of their extinction, to the female line, and whereby the indissolubility and indivisibility of the monarchy are determined ; is based, further, on the diploma of the Emperor Francis Joseph I. of 20th October 1860, whereby the constitutional form of government is introduced ; and on the fundamental laws of the 21st December 1867, regulating the affairs common to all lands of the monarchy.

The unity of the monarchy is expressed in the common head of the state (emperor of Austria and apostolic king of Hungary) and in the declared community of certain state departments (Foreign Affairs and the Army), as also of the organs appointed for their maintenance—the Delegations, Common Ministry, Common Supreme Court of Exchequer. In other relations the two states of Austria and Hungary, composing the monarchy, are completely independent, each having its separate parliament and separate Government. The constitutional right of voting money applicable to the common affairs and of its political control is exercised by the Delegations, which consist each of sixty members, chosen for one year, one-third of them by the Austrian Herrenhaus (Upper House) and the Hungarian Table of Magnates (Upper House), and two-thirds of them by the Austrian and the Hungarian Houses of Representatives. The Delegations are annually summoned by the monarch alternately to Vienna and to Budapest. Each delegation has its separate sittings, both alike public. Their decisions are reciprocally communicated in writing, and, in case of non-agreement, their deliberations are renewed. Should three such interchanges be made without agreement, a common plenary sitting is held of an equal number of both delegations ; and these collectively, without discussion, decide the question by common vote. The common decisions of both Houses require for their validity the sanction of the monarch. Each delegation has the right to formulate resolutions independently, and to call to account and arraign the common ministers. In the exercise of their office the members of both delegations are irresponsible, enjoying constitutional immunity.

For the administration of common affairs there are three ministries : the Ministry of the Imperial House of Foreign Affairs ; the Ministry of War, including the naval department ; and the Common Ministry of Finance. For the control of the common finances there is appointed a Common Supreme Court of Exchequer. The Ministry of Foreign Affairs can conclude international treaties. But commercial treaties and such state treaties as impose burdens on the state, or parts of the state, or involve a change of territory, require the parliamentary assent of both states. The Common Ministry of War is the highest authority for the administration of all military affairs, to the exclusion of the functions committed to the ministries

for national defence of the two states. For the military and administrative service of the army there are fifteen military territories (fourteen corps-commands and one military command), besides a special corps-command for Bosnia and Herzegovina. Under these territorial authorities are the supplementary (*Ergänzungs*) district-commands (103 for the army, three for the navy), whose business it is to fill up deficiencies in the army and to keep the register of the troops.

The army on a peace footing numbers 21,203 officers and military functionaries, 283,877 men, and 58,475 horses. The strength of the different bodies of troops is :—

	Officers.	Men.	Horses.
Bodyguard Infantry	4	129	...
Infantry	8,816	161,002	1,020
Chasseurs	974	16,491	92
Mounted Bodyguard	4	132	76
Cavalry	1,764	45,726	40,686
Field Artillery	1,533	25,502	13,901
Fortress Artillery	398	7,762	134
Pioneers	480	8,430	15
Railway and Telegraph Regiment	86	1,487	4
Transport Service (train)	417	3,309	1,916
Other Services	917	5,863	1,922
Total	15,443	275,833	59,766
Extraordinary Force	44	4,533	1,632

The navy on its peace footing consists of 811 officers, &c., and 2486 sailors for land service ; 638 officers and 5450 sailors for sea service ; total number of persons belonging to the navy, 9385. The fleet consists of :—

	Number.	Displacement Tons.	Horse-Power.	Crew.
Battleships and cruisers	27	126,805	169,000	9,087
Torpedo boats	75	7,492	77,800	1,522
Transports	3	5,490	5,500	383
River boats	6	1,556	4,090	300
Ships for mission stations and coast service	15	18,588	13,750	2,731
Ships for special purposes and ships of servitude	10	7,760	5,905	222
Training ships	10	12,920	2,960	1,547
Hulks	5	6,510	...	186
Total	151	187,121	279,005	15,978

The Common Ministry of Finance has charge of the finances of common affairs, of the state debt, consisting of Treasury bills and bills guaranteed in common, and of the still standing common funds. The requisitions of

	(In thousands sterling.)

Commerce.—On the basis of the customs and commercial agreement between Austria and Hungary, concluded in 1867 and renewable every ten years, the following affairs, in addition to the common affairs of the monarchy, are in both states treated according to the same principles:—Commercial affairs, including customs legislation; legislation on the duties closely connected with industrial production—on beer, brandy, sugar, and mineral oils; determination of legal tender and coinage, as also of the principles regulating the Austro-Hungarian Bank; ordinances in respect of such railways as affect the interests of both states. In respect, also, of the principles of the military system and of the yearly vote of the contingent of recruits, the laws passed in both states must always be in accord. In conformity with the customs and commercial compact between the two states, renewed last in 1899, the monarchy constitutes one identical customs and commercial territory, inclusive of the occupied provinces of Bosnia and Herzegovina and the principality of Liechtenstein. Outside of this customs and commercial territory, there are only the two free ports of Trieste and Fiume, and the two small communities of Tirol and Vorarlberg, which are consigned to the German customs territory. The foreign trade of the monarchy, in the scope defined by the inclusions and exclusions above specified, amounted in the three years 1889, 1898, and 1899, to the following respective values in millions sterling:—

	1889.	1898.	1899.
Total Imports . . .	47·4	63·3	65·8
Total Exports . . .	63·8	67·2	77·3

In 1889 and 1899 there was accordingly an excess of exports to the values of £16,400,000 and £11,500,000, whereas in 1898 the imports exceeded the exports by £1,100,000.

Of the total imports in 1899, wool and woollen yarns and goods composed 11·35 per cent.; cotton and cotton yarns and goods, 8·63 per cent.; wood, coal, and turf, 5·68 per cent.; silk and silk goods, 5·50 per cent.; animal products, 5·42 per cent.; base metals and wares, 4·15 per cent.; vegetables and fruit, 4·11 per cent.; corn, pulse, and meal, 3·50 per cent.; colonial goods, 2·97 per cent.; leather and leather goods, 2·93 per cent.; machinery and apparatus, 2·90 per cent.; literary and artistic objects, 2·90 per cent.; instruments, watches, and hardware, 2·82 per cent.; flax, hemp, jute, and wares, 2·73 per cent.; drinks, 2·57 per cent. Of

exports, wood, coal, and turf composed 17·08 per cent.; sugar, 9·38 per cent.; corn, pulse, fruit, and meal, 7·94 per cent.; animal products, 7·80 per cent.; animals for slaughter and beasts of burden, 5·94 per cent.; vegetables and fruit, 5·38 per cent.; wool, yarns, and textiles, 4·42 per cent.; precious metals and coins, 3·82 per cent.; leather and leather goods, 3·25 per cent.; instruments, watches, and hardware, 3·13 per cent.; glass and glass wares, 2·65 per cent.; iron and iron wares, 2·43 per cent.; wooden and bone articles, 2·43 per cent.; drinks, 2·39 per cent.; clothes, linen, finery, 2·31 per cent.

Of agricultural, forest, and fishery produce in the year 1899, the value of imports amounted to £31,300,000; of exports, £28,900,000. Of the products of the mining and smelting industries, the imports (1899) were £8,000,000; the exports, £5,500,000. The imports of the other industries valued £26,600,000; the exports, £42,900,000. Of the total imports about 10 per cent. came, of the total exports about 6 per cent. went, by sea; the rest by land.

The most important place of derivation and of destination for the Austro-Hungarian trade is the German empire, with 35 per cent. of the imports and 54 per cent. of the exports. Great Britain's share is 12 per cent. of the imports and 9 per cent. exports; Italy, 7 per cent. imports, 7 per cent. exports; Russia, 7 per cent. imports, 3 per cent. exports; France, 3 per cent. imports, 3 per cent. exports; the United States of America, 8 per cent. imports, 2 per cent. exports; India, 6 per cent. imports, 2 per cent. exports. Important is the trade also with the Netherlands, Rumania, Servia, Turkey, and Switzerland.

The Austro-Hungarian Bank.—Common to the two states of the monarchy is the "Austro-Hungarian Bank," which possesses a legal exclusive right to the issue of bank notes. In virtue of the new bank statute of the year 1899 the bank is a joint-stock company, with a stock of 210,000,000 crowns (£8,780,000). The bank's notes of issue must be covered to the extent of two-fifths by legal specie (gold and current silver) in reserve; the rest of the paper circulation, according to bank usage. When the amount of bank notes in circulation exceeds the specie in reserve by more than 400,000,000 crowns, the bank has to pay both states a tax of 5 per cent. on the surplus. The management of the bank and the supervision exercised over it by the state are established on a footing of equality, both states having each the same influence.

2. Austria Proper.

Austria proper comprises the "kingdoms and lands represented in the Reichsrath," covering an area altogether of 115,533 English square miles, with a population at the census of 31st December 1890 of 23,895,413, or 208 inhabitants per square mile. Of this population over 6,000,000 are distributed among 772 towns, and over 17,000,000 are scattered in 58,479 rural communities. In 1900 the largest towns were:—Vienna, with 1,639,811 inhabitants; Prague, 197,000; Trieste, 167,000; Lemberg, 142,000; Graz, 125,000; Brünn, 105,000. For every 1000 men there are 1044 women. Of the population 60·5 per cent. are single; 33·3 per cent. are married; the rest are widowers, widows, or divorced. For every 1000 inhabitants, again, there are 129 under 6 years of age; 110, from 6 to 10 years old; 103, from 10 to 15 years old; 609, from 16 to 65 years old; and 49 above 65 years of age. Further, for every 1000 inhabitants 16 marry per year; 37 to 39 are born; and 25 to 28 die. Of persons marrying, 88 per cent. are single, and 12 per cent. widowers or widows. For every 1000 children born, 514 are males, 148 illegitimate, and 28 still-born. For every 1000 males that have died, 354 died in their first year and 507 at an age between 1 and 5 years; for every 1000 females that have died, 299 died in their first year and 455 at an age between 1 and 5 years. The proportion of marriages, living births, and deaths for the years 1875, 1885, 1895, and 1898 is shown in the following table:—

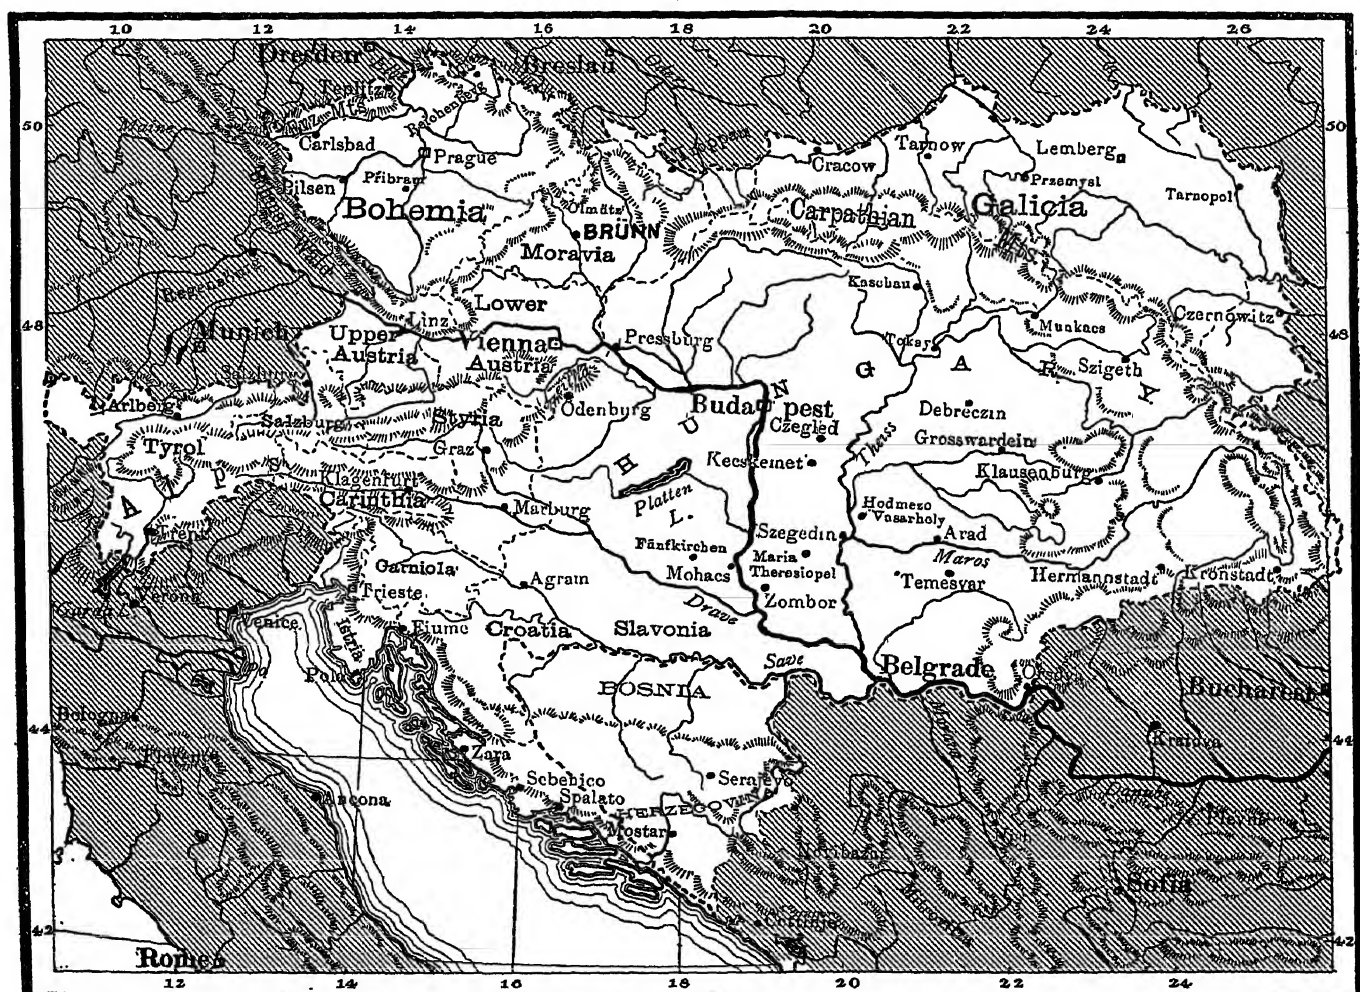

Year.	For every 1000 Inhabitants the number of		
	Marriages.	Born alive.	Deaths.
1875	17·26	40·29	30·33
1885	15·32	37·63	30·15
1895	16·10	37·94	27·53
1898	15·66	37·20	24·90

The transmarine emigration averaged per year, from 1889 to 1893, 38,240; from 1894 to 1898, 31,218 persons. Of these emigrants two-thirds went to North America, and almost all the rest to Brazil, Argentina, and Uruguay.

At the censuses of 1880 and 1890, the different races, as determined by the different languages spoken by them, were represented as follows:—

	In percentages of the Home-born Population.	
	1880.	1890.
Germans	36.75	36.05
Bohemians, Moravians, Slovaks	23.77	23.31
Poles	14.86	15.84
Ruthenians	12.83	13.23
Slovenes	5.23	5.01
Servians and Croats	2.58	2.75
Italians and Ladini	3.07	2.88
Rumanians	0.88	0.89
Magyars	0.05	0.04

Of the Germans, 28 per cent. are in Lower Austria; 25.5 per cent. in Bohemia; 10 per cent. in Styria; 9 per cent. in Upper Austria; 8 per cent. in Moravia; 5 per cent. in Tirol; the rest being scattered over all the other Austrian lands. Of the Bohemians, Moravians, and Slovaks, 66 per cent. are in Bohemia; 29 per cent. in Moravia; 2 per cent. in Silesia; 1.7 per cent. in Lower Austria. The Poles are found almost exclusively in Galicia (94.4 per cent.) and Silesia (4.8 per cent.). The Ruthenians occupy Galicia (91.3 per cent.) and Bukovina (8.6 per cent.). Of the Slovenes 39.6 per cent. are in Carniola; 34 per cent. in Styria; 17.5 per cent. in the Coast Province; 8.6 per cent. in Carinthia. Of Servians and Croats, 77.7 per cent. were counted in Dalmatia and 21.9 per cent. in the Coast Province. Of the Italians 53.2 per cent. are settled in Tirol; 43.6 per cent. in the Coast Province; 2.4 per cent. in Dalmatia. The Rumanians are confined almost exclusively in Bukovina (99.6 per cent.). The Magyars belonging to the Austrian state are to be found only in Bukovina. Of Austrian lands, Lower and Upper Austria, Salzburg, and Vorarlberg are almost purely German. In Styria 68 per cent. of the population is German, and 32 per cent. Slovenes. In Carinthia, 71.5 per cent. of the population is German, against 28.5 per cent. of Slovenes. In Tirol 55 per cent. of the population is German and 45 per cent. Italian. In Silesia 48 per cent. of the population is German, against 30 per cent. of Poles and 22 per cent. of Czechs. In Bohemia the Czechs preponderate to

SKETCH MAP OF AUSTRIA-HUNGARY.

the extent of 63 per cent. of the population against 37 per cent. of Germans. Moravia is divided between 70 per cent. Czechs and 30 per cent. Germans. In Carinthia the Slovenes constitute 94 per cent. of the population, the Germans only 6 per cent. In the Coast Province 45 per cent. of the population is Italian, 31 per cent. Slovenes, and 21 per cent. Serbo-Croats, the Germans composing only 2.3 per cent. Galicia has a population 53 per cent. Polish, 43 per cent. Ruthenian, and 3.5 per cent. German. In Bukovina the Ruthenians form 42 per cent. of the population,

side by side with a Rumanian population 32 per cent., a German population 21 per cent., Poles 3.7 per cent., and Magyars 1.3 per cent.

Of the total population 91 per cent. belong to the Catholic Church, and by far the greatest part of the Catholics are Catholics according to the Roman rite. Catholics of the Greek and the Armenian rite are con-

fined almost exclusively to Galicia and Bukovina; the former constituting 11·8 per cent. of the total population of the state, the latter 0·01 per cent. In addition,

Religion. Old Catholics are to be found scattered about, making up a total strength of 0·03 per cent. of the population of Austria. The Greek (*i.e.*, Oriental or Orthodox, not the united) Church is represented in far its greatest strength in Bukovina (70 per cent.) and in Dalmatia (16·5 per cent.). The Protestants compose some 2 per cent. of the total population; nearly three-fourths of them belong to the Augsburg or Lutheran Confession, one-fourth to the Reformed, Calvinistic, or Helvetican Confession. The Protestants are most numerous in Silesia, where they form 14 per cent. of the population; next in Carinthia (5 per cent.), Moravia (2·7 per cent.), Bukovina (2·5 per cent.), and Bohemia (2·2 per cent.). The adherents to the Augsburg Confession are most strongly represented in Silesia (27 per cent. of their total strength), Bohemia (19 per cent.), Lower Austria (14 per cent.), and Galicia (12 per cent.). Of the adherents to the Reformed Confession, 55 per cent. are in Bohemia, 31 per cent. in Moravia, 6 per cent. in Lower Austria, and 4 per cent. in Galicia. Representatives of other Christian Confessions in Austria are Herrnhuters in Bohemia; Anglicans in Lower Austria, Trieste, Bohemia, and Galicia; Mennonites in Galicia; Unitarians in Lower Austria; Lippovanians in Bukovina. The Jews compose 4·8 per cent. of the entire population, and are in greatest strength in Galicia, where there are 67·5 per cent. of their total number in Austria; in Lower Austria, 11·3 per cent.; in Bohemia, 8·3 per cent.; in Bukovina, 7·2 per cent.; in Moravia, 4 per cent. The provinces in which the Jewish ingredient in the total population is most pronounced are Bukovina, where they constitute 12·8 per cent. of the total population; Galicia, 11·7 per cent.; Lower Austria, 4·8 per cent. The Catholic Church has 7 Latin archbishoprics, 1 Greek and 1 Armenian archbishopric; 23 Latin and 2 Greek bishoprics. The Greek Oriental Church has 2 archbishoprics and 2 bishoprics. The Evangelical Church has 5 superintendents of the Augsburg, 3 of the Helvetican, and 1 of Mixed Confession. The Israelitish Confession has 545 religious communities, most of them in Galicia, Bohemia, and Moravia. The Roman Catholic Church rules over (1895) 488 monasteries with 8530 monks and 647 nunneries with 15,616 nuns. The Greek Oriental Church has 3 monasteries with 48 members. The capital stock of the Catholic Church is authentically estimated at 283,500,000 florins; that of the cloisters and other church establishments at 126,000,000 florins.

Public instruction is organized in four groups of educational institutions, high schools, middle schools, technical schools, and elementary schools. There are eight universities:—Vienna, Graz, Innsbruck, Prague (German), and Czernowitz, in all which German is the language of instruction; Prague (Bohemian) with Czech, Cracow and Lemberg with Polish, as the language of instruction. Each university has four faculties

Year.	Teaching Staff.	Ordinary Professors in Teaching Staff.	Lectures.	Students.	Ordinary Students among the Students.
1875	689	273	1091	9,227	7,616
1885	1029	334	1541	13,069	11,361
1895	1262	424	1925	16,560	13,169
1898	1395	451	2086	17,322	13,624

—theology, law and political science, medicine, and philosophy. In Czernowitz, however, the faculty of medicine is wanting. The theological faculties are all Roman Catholic, except in Czernowitz, where the theo-

logical faculty is Greek-Oriental. The preceding table gives summary figures for all the eight universities during the winter sessions of the years specified. The figures of 1875, however, do not include the universities of Bohemian Prague and Czernowitz. There are seven technical high schools in Vienna, Graz, Prague, Brünn, in which German is the language of instruction; Prague and Brünn with Czech, and Lemberg with Polish, as the language of instruction. There is also one high school for agriculture in Vienna. At these high schools there are special technical departments:—Engineering, building (above ground), machine-making, technical chemistry, and a general department. The building department is wanting in Brünn (German), and the general department in Lemberg. The technical high school in Brünn (Czech) was founded in 1899. The high school for agriculture includes a school of husbandry, of forestry, and of technical culture. The attendance at these institutions during the winter sessions was as follows:—

Year.	Teaching Staff.	Ordinary Professors in Teaching Staff.	Lectures.	Students.	Ordinary Students among the Students.
1875	287	102	441	3570	3152
1885	372	120	846	2566	2399
1895	416	130	678	3144	2803
1898	449	135	692	4628	4136

In addition there exist, in the character of high schools, 2 mining academies in Leoben and Příbram; 3 art schools in Vienna, Prague, and Cracow; 2 Catholic theological faculties at Salzburg and Olmütz; 1 evangelical theological faculty at Vienna; and 1 veterinary high school at Vienna. There are, further, 45 theological educational institutions; among them 1 Greek-Catholic and 1 Armenian-Catholic, as also a Greek-Oriental, educational institution. As middle schools there are gymnasia, real-gymnasia, and real-schools. Gymnasia are intended for humane (or classical) culture; the others for general culture. Their growth is shown in the following figures:—

Year.	Gymnasia and Real-Gymnasia.			Real-Schools.		
	Number.	Teachers.	Pupils.	Number.	Teachers.	Pupils.
1875	155	2527	34,137	74	1302	21,552
1885	172	3512	54,288	80	1353	16,969
1895	181	3756	56,152	80	1610	23,600
1898	196	3962	59,980	93	1812	27,011

For the training of teachers of elementary schools, there are 50 institutions for male and 33 for female teachers. Further, there are 187 commercial schools and 940 industrial schools. Among the latter, 21 are national industrial schools and institutions of kindred character; 158 are technical schools for particular industrial branches; 11 are general trades schools, and 750 are industrial adult schools. There are, moreover, 137 schools of agriculture and of forestry, 6 lower-grade mining schools, 3 nautical schools, 8 veterinary and horse-shoeing schools, 15 midwifery schools, 509 schools for musical and dramatic culture, 612 schools for female hand-work and tailoring, and 802 other special teaching and educational institutions. Elementary instruction is given by the national schools (*Volksschulen*), and, in the larger towns, by the burgher schools. By virtue of a law passed in 1869 every community is, in general, bound to establish a public primary school. Apart from certain exceptions, attendance at school is obligatory on all, from the 6th to the 14th year of age. Side by side with the public schools, private schools are also allowed, which, if fulfilling the legal requirements, may

be accorded the validity of public primary schools. The progress of the primary and burgher schools is shown in the following table :—

Year.	Public Schools.			Private Schools.
	Number.	Teachers.	Pupils.	Number.
1875	14,257	27,677	2,050,808	909
1885	16,440	54,467	2,679,638	976
1895	18,285	69,776	3,260,852	987
1898	18,747	74,783	3,359,509	988

Of the public primary schools in 1898, 42 per cent. had each but 1 class; 25 per cent., 2; 11 per cent., 3; 7 per cent., 4; 11 per cent., 5; 4 per cent., 6-8 classes of graduated ascension. In 40 per cent. of the public primary schools, German was the language of instruction; in 26 per cent., Czech; in 11 per cent., Polish; in 10 per cent., Ruthenian; in 4 per cent., Italian; in 4 per cent., Slovenian; in 2 per cent., Serbo-Croatian; in the rest of the schools, Rumanian or Magyar. For every 1000 square kilometres, there are 66, for every 100,000 inhabitants, 77 primary schools. To each primary school there are, on an average, 176·5 pupils; to each teacher, 50 pupils; for every 100 children under obligation to attend, there are 88 actually attending school.

The Reichsrath exercises the legislative power for all the kingdoms and lands constituting the state. It consists since 1861 of two Houses; an Upper House (the *Herrenhaus*) and a Lower House (the *Abgeordnetenhaus*). The Upper House has continued unchanged in its composition; the Lower House has undergone considerable changes in 1867, 1873, and 1892. Formerly, the members of the Lower House were returned by the diets of the various provinces; since 1873 they are appointed by the direct vote of the citizens. By an electoral law of the Reichsrath passed on the 14th June 1896, the Lower House consists of 425 representatives chosen in 5 curias: the first curia comprising the representatives of the large landed estates; the second, representatives of the chambers of commerce and manufactures; the third, representatives of the towns, market-places, and industrial localities; the fourth, representatives of the rural communities; the fifth consists of 72 representatives of all duly-qualified citizens over 24 years of age. For this last curia, those also who have already exercised their electoral right in the four other curias are entitled to vote. The Government is constituted of the council of ministers, at whose head is the minister-president. The different ministries are the ministry of the interior, of national defence, of worship and instruction, of finance, of commerce, of agriculture, of justice, of railways. There are, further, two ministries without portfolio for Galicia and Bohemia. The civil administration in the different provinces is carried on by governors or stadholders (*Statthalter*), and, in the smaller provinces, provincial governments; subordinate to them are the heads of the various districts. For the administration of justice in the provinces there are 8 upper provincial courts (*Oberlandesgerichte*), under which are the provincial and district courts (*Landes- und Kreis-gerichte*), as also the county courts (*Bezirksgerichte*). For the administration of the finances there are constituted financial provincial boards of directors (*Finanz landesdirectionen*), and, in the smaller provinces, financial boards of directors (*Finanz directionen*), under which are the financial county boards of directors and the boards of inland revenue. The provincial representation in the 17 provincial diets of the different kingdoms and lands of the state is based on the provincial regulations of the year 1861. The autonomous provincial administration is discharged by the provincial committees

of the separate diets. In Bohemia, Styria, and Galicia, autonomous county representation is organized. Local self-administration is everywhere in the competence of the local communities. Among these are 33 with special statute, having, like heads of districts, the management also of the civil administration. The growth of the Austrian budget is shown by the following figures :—

	1875.	1885.	1895.	1900.
Expenditure . . .	£32,647,000	£44,121,600	£55,896,916	£66,003,494
Revenue . . .	£32,647,000	£43,714,666	£57,446,091	£66,020,475

The debt consists of the (earlier) general debt, the later consolidated debt, and the floating debt.

These debts for the four years specified were :—

	1875.	1885.	1895.	1899, end of June.
(In millions sterling.)				
<i>General State Debt—</i>				
Consolidated . . .	223·33	223·61	225·02	222·76
Floating . . .	7·95	6·28	3·52	3·00
Other debt . . .	1·13	1·13	1·13	1·13
<i>Debts of the Lands of the Reichsrath—</i>				
Consolidated	45·81	119·25	134·37
Floating	0·12	0·26	1·26
	232·41	276·95	349·18	362·52

The actual financial situation will be seen in detail in the following budget of the Austrian administration for 1900 :—

	Ordinary.	Extra-ordinary.	Total.
<i>Expenditure.</i>			
Imperial Household . . .	£387,177	..	£387,177

Of the whole territory of the state—in round numbers, 30,000,000 hectares (or 74,100,000 acres)—about 29 per cent. is appropriated to large landed estates; 71 per cent. is disposed of in medium and smaller properties. Large landed property is most strongly represented in Bukovina, where it absorbs 46 per cent. of the whole territory. Large landed property owns 30 to 40 per cent. of all the land of Salzburg, Galicia, Silesia, and Bohemia. In Moravia, Styria, Carinthia, Tirol, and Vorarlberg, Upper and Lower Austria, large landed estates claim 20 to 30 per cent. of the soil. Large landed property holds, in Carniola, 16 per cent. of the ground; in the Coast Province, 8 per cent.; in Dalmatia, 3 per cent. To the state

Landed property.

belongs $4\frac{1}{2}$ per cent. of the total territory. The Church, the communities, and the corporations are also in possession of large areas of land; 4 per cent. (speaking roundly) of the territory of Austria is held on the tenure of fidei-commisum. Of the entire property in large landed estates, 59 per cent. is laid out in woods; of the property in fidei-commisum, 66 per cent. is woodland; of the entire forest land, about 10 per cent. is the property of the state; 14.5 per cent. is communal property; and 3.8 per cent. is the property of the Church. The whole of the territory in large landed estates includes 52 per cent. of the entire forest land. The forest land held under fidei-commisum amounts to over 9 per cent. of the entire forest land.

Agriculture, however, forms the most important source of income. Over 55 per cent. of the population draw their principal revenue from it. Of the whole area of the state,

Agriculture. 35.45 per cent. is laid out in arable land; 10.26 per cent. in meadows; 2.07 per cent. in gardens and vineyards; 8.88 per cent. in pastures; 4.66 per cent. in mountain pastures; 32.59 per cent. in woods; 0.88 per cent. in lakes, marshes, and ponds; 3 per cent. of the land is unproductive. The rest of the land is disposed of in other, not agricultural, uses. The lands having the largest proportions of arable soil are Bohemia, with 24.7 per cent.; Moravia, with 11.4 per cent.; and Galicia, with 35.8 per cent. Of land laid out in vineyards, Dalmatia has 33 per cent.; the Coast Province, 22.3 per cent.; Lower Austria, 16 per cent.; and Styria, 13.7 per cent. Of mountain pastures, Tirol has the largest share, 55.6 per cent.; Salzburg has 14.8 per cent.; Carinthia, 12.6 per cent. of woodland; 20.7 per cent. falls to Galicia; 15.4 per cent. to Bohemia; 11.3 per cent. to Tirol; 11 per cent. to Styria. Within the bounds of each province, Styria has the greatest proportion of its surface under wood, namely, 47.9 per cent. of its whole area; Carniola has 44.4 per cent.; Carinthia, 44.2 per cent.; Bukovina, 43.2 per cent.; Tirol, 38.8 per cent. The most thinly-wooded provinces are Galicia, with 25.8 per cent. of its surface in wood; Moravia, with 27.4 per cent.; Bohemia, with 29 per cent.; and Dalmatia, with 29.7 per cent.

The produce of the ploughed land does not, on the whole, suffice for the home requirements. Considerable quantities, in particular of wheat and maize, are imported from Hungary for home consumption. Only barley and oats are usually reaped in quantity for export.

The respective areas of crop lands, the relative average yields and the total yields, in different crops, for different years, may be gathered from the following tables:—

Quinquennial Average in 1000 Acres.

	1881-5.	1891-5.	1899.
Under wheat	2614	2677	2600
„ rye and spelt	4724	4675	4464
„ barley	2609	2767	2883
„ oats	4367	4578	4532
„ maize	861	861	817
„ pulse	640	674	(1898) 694
„ potatoes	2522	2677	2866
„ sugar beet	500	610	509
„ (cattle) turnip	349	398	386

For every acre of land the average produce in the different crops in bushels was:—

	1881-5.	1891-5.	1899.
In wheat	15.51	15.81	18.6
„ rye and spelt	15.41	15.49	18.5
„ barley	17.72	19.61	22.3
„ oats	20.88	21.97	26.1
„ maize	18.72	18.93	16.8
„ potatoes	109.26	84.63	(1898) 108.0

For each acre in cwts. :—

	1881-5.	1891-5.	1899.
In sugar beet	157.03	169.54	(1898) 180.1
„ (cattle) turnip	107.50	121.01	(1898) 132.1

The total produce in millions of bushels was accordingly :—

	1881-5.	1891-5.	1899.
In wheat	41.8	43.5	50.0
„ rye and spelt	75.1	74.6	84.9
„ barley	47.6	56.1	66.5
„ oats	94.0	103.7	121.5
„ maize	16.5	16.8	14.1
„ pulse	7.4	8.6	(1898) 9.7
„ potatoes	284.1	232.4	319.3

In millions of cwts. :—

	1870-5.	1881-5.	1891-5.	1899.
In sugar beet	47.4	80.8	112.8	(1898) 94.4
„ (cattle) turnip	26.6	38.6	50.2	(1898) 52.6

Besides these principal crops, other crops of considerable magnitude were: Buckwheat in Styria, Galicia, Carniola, and Carinthia; rape and rape-seed in Bohemia and Galicia; poppy in Moravia and Silesia; flax in Bohemia and Moravia, Styria, and Galicia; hemp in Galicia; chicory in Bohemia; tobacco in Galicia, Dalmatia, and Tirol; fuller's thistle in Upper Austria and Styria; chrysanthemum in Dalmatia; cabbage in Bohemia and Galicia, Lower Austria, and Styria; hops in Bohemia, Galicia, and Moravia; rice in the Coast Province; chestnuts in the Coast Province and Tirol; olive oil in the Coast Province and Dalmatia; mulberry leaves in Tirol, Dalmatia, and the Coast Province; the vine in Lower Austria, Styria, the Coast Province, Tirol, and Dalmatia.

In the forest land tall timber predominates to the extent of 85 per cent., and consists of conifers much more than of green or leaved trees, in the proportion of 70 against 15 out of the 85 per cent. of the total forests laid out in tall timber. Exceptions are the forest lands of the Karst, where, in the Coast Province, medium-sized trees and underwood occupy 80 per cent., and of Dalmatia, where underwood occupies 92.6 per cent., of the forest land. Green (or leaved) wood is most prevalent in Carniola, where it forms 44.5 per cent. of the total forest; in Galicia it has 24.5 per cent. of the forest; in Bukovina, 22.1 per cent.; in Lower Austria, 17 per cent. Scantiest in green tall timber is Tirol, where greenwood has only 2.2 per cent. of all the forest; Bohemia, with 4 per cent. in greenwood out of the entire forest land; Dalmatia, 4.1 per cent. of greenwood in its forest. Greenwood is poorly represented also in Salzburg and Carinthia, in whose forests its share is only 7 to 8 per cent.

The amount of live stock is registered every ten years along with the census of population. The numbers of the different kinds of live stock in 1869, 1880, and 1890 were :—

	1869.	1880.	1890.
Horses	1,389,623	1,463,282	1,548,197
Mules and asses	43,070	49,618	57,952
Cattle	7,425,212	8,534,077	8,643,936
Goats	979,104	1,006,675	1,035,832
Sheep	5,026,398	3,841,340	3,186,787
Pigs	2,551,473	2,721,541	3,549,700
Beehives	913,783	926,312	920,640

The average yearly increase accordingly in horses was 0.53 per cent.; in mules and asses, 1.53 per cent.; in cattle, 0.74 per cent.; in goats, 0.28 per cent.; in pigs, 1.82 per cent.; in beehives, 0.04 per cent. Sheep, on the other hand, have diminished in number by 1.92 per cent. yearly average. Galicia has the greatest number of horses to the square kilometre, viz., 9.75, the horses in the whole of Austria averaging only 5.16 to the square kilometre. Upper Austria has 46.14 head of cattle to the square kilometre, against an average of 28.81 per square kilometre for the entire monarchy. Goats most abound in Dalmatia, numbering 14.04 to the square kilometre, against an average of 3.45 in the whole state. Sheep are most numerous in Dalmatia (61.16) and Istria (49.36), against 10.62 per square kilometre in the entire state. The rearing of pigs is carried on most largely in Styria, 28.43, in Lower and Upper Austria, 20.82 and 20.68 respectively, against 11.83 to the square kilometre in the whole of Austria. The beehives to every square kilometre in Carinthia are 5.25; in Carniola, 4.95; in Styria, 4.48, against 3.07 in all Austria. Galicia has the greatest number of horses to every 100 inhabitants, viz., 11.59; Dalmatia, the greatest number of mules and asses, viz., 5.90 to every 100 inhabitants; Salzburg, the greatest number of cattle, with 82.69, and Upper Austria with 70.38; Dalmatia, the greatest number of goats, with 34.15; Dalmatia, the greatest number of sheep, with 148.80, and Istria, 76.98; Styria, the greatest number of pigs, with 49.71; Carinthia, with 38.36; and Upper Austria, with 31.55; Carinthia, the greatest number of beehives, with 15.03; and Carniola, with 10.06. Altogether, a very important source of revenue is the rearing of cattle, which is quite a characteristic feature in the husbandry of the land and regularly yields a large excess for export.

Mining is an industry of the greatest consequence on account not only of the manifold variety of its products, but of the great extension it has attained in certain branches. **Minerals.** In quantity, the coal mines yield the heaviest output: in 1899, 115 million metric centners (a centner is nearly $\frac{1}{16}$ ton) of pit coal. Of this amount Silesia yielded 48 millions; Bohemia, 41 millions; Moravia, 16 millions; and Galicia, 9 millions. Of

brown coal, the mines of Austria yielded 218 million metric centners, of which Bohemia contributed 180 millions; Styria, 26 millions; Upper Austria, 4 millions. Of iron ores, over 17 million metric centners were mined, Styria yielding 10 millions; Bohemia, 5 millions. 2·8 million metric centners of petroleum were produced in Galicia; 923,000 metric centners of quicksilver in Carniola. Austria yielded 318,000 metric centners of graphite, of which Bohemia produced 199,000; while Moravia, Styria, and Lower Austria also contributed their quotas. Of 371,000 metric centners of zinc ores for all Austria, Carinthia produced 219,000; Galicia, 71,000; Bohemia, 21,000; and Tirol, 43,000. Of alum and alum slate 199,000 metric centners were dug out in Bohemia; 215,000 metric centners of silver ores in Bohemia. Out of 135,000 metric centners of lead ores produced in Austria, 99,000 were the product of Carinthia, and 19,000 of Galicia. Austria yielded 67,000 metric centners of copper ores, to which Salzburg contributed 58,000; and Tirol, 9000 metric centners. 69,000 metric centners of ozocerite were raised in Galicia; 54,000 metric centners of manganese ores in Carniola and Bukovina. Small quantities of gold ores are mined in Bohemia and Salzburg. Uranium, tin, bismuth, antimony, and wolfram ores are dug out in Bohemia; pyrites in Tirol, Bohemia, and Styria; asphalt in Tirol. The increase in the value of the mining products in the most important branches is seen in the following table:—

Minerals.	(In millions of florins.)			
	1875.	1885.	1895.	1899.
Pit coal	18·2	22·2	34·1	47·7
Brown coal	15·1	17·8	34·9	47·6
Iron ores	2·8	2·2	3·0	4·9
Petroleum	0·7	1·6	4·5	3·0
Ozocerite	0·2	1·9	0·9
Silver ores	2·4	3·2	2·3	1·8

The total annual value of the mining products amounts to about 100 million florins. The total value of the products of the foundries amounts to 40 million florins. Of this amount, 32 millions represent the value of the fined iron and steel and pig-iron; 1·8 millions, of lead and litharge; 1·95 millions, of silver; 1·2 millions, of quicksilver; 1·2 millions, of zinc. On account of the Government monopoly, the production of salt is wholly under state control, and is therefore almost exclusively restricted to the satisfaction of the home demand. In 1899 somewhat over 3·3 million metric centners of salt were produced, of which 0·43 million metric centners were rock-salt, obtained almost wholly from Galicia and Bukovina; 1·85 million metric centners salt obtained by decoction from the salt-pits in the Salzkammergut, in Tyrol, Galicia, and Bukovina; 0·31 million metric centners sea-salt obtained in Istria and Dalmatia; 0·66 million metric centners salt for manufacturing purposes, obtained principally in Galicia. On the basis of the prices of the monopoly, the value of the yearly salt production is calculated at 25,310,000 florins.

Since 1875 industry has, in many branches, made very considerable advance. Out of every 1000 persons there were in 1870 hardly 200 engaged in any industries; in 1880 the number per 1000 had risen to 228, and in 1890 to 258.

The industrial development applies principally to the following branches:—For the production of raw iron wares there were in 1890, 74 blast furnaces at work, giving a yearly output of about 6 million metric centners of bloom-iron and 1 million metric centners of pig-iron. The production of fined iron and steel amounted to about 5 million metric centners; just as much was the amount of the production of the iron and steel refining works. A speciality are the rod-iron wares produced in the Alpine lands. For metallic alloys (*Packfong* or German silver, an alloy of nickel and copper, and another alloy of nickel and tin), the works in Lower Austria (particularly those at Berndorf) are celebrated. The manufacture of machinery employed in 1890, 304 works, chiefly in Lower Austria and Bohemia. The industry in the means of transport (carriages and railway waggons) yields an excess for export. In the manufacture of musical and scientific instruments, and also in pottery wares, Austria plays an important part. The porcelain industry of the Eger district has a world-wide reputation. The glass industry, too, in Bohemia is richly developed, and rules the markets of the world. The production in bottle, plate, and mirror-glass amounts in round figures to one million metric centners yearly. The industry in wood, particularly in stylish furniture, has attained great development, and large supplies are exported. The manufacture of buttons is also a very active branch of industry. The leather industry, which is widely extended, yields, particularly in gloves and fancy articles, excellent products also for export. The manufacture of silk and velvet goods employed in 1890 about 52,000 spindles (against 70,000 in 1880), 4900 handlooms (against 4000 in 1880), and over 3000 power-looms (against 700 in 1880). Silk-spinning is carried

on only in Tirol and Görz; silk and velvet weaving principally in Vienna. The woollen industry employed:—

	1880.	1890.
Carded yarn spindles	570,000	392,000
Worsted yarn spindles	73,200	262,256
Carded yarn handlooms	17,600	2,045
„ „ power-looms	3,130	6,351
Worsted yarn handlooms	7,560	7,600
„ „ power-looms	5,000	15,700

The woollen industry has its principal seats in Bohemia, Moravia, Silesia, and Lower Austria.

The cotton industry employed:—

	1880.	1890.
Fine spindles	1,760,000	3,121,000
Handlooms	5,200
Power-looms	31,000	48,000
(In connexion with the power-looms) handlooms	62,000	21,300

The industry is mostly carried on in Bohemia, Lower Austria, and Vorarlberg. Handloom weaving is in fast decline.

The linen and jute industry has likewise reached a high degree of development, forming an important branch of the textile industry. It employed:—

	1880.	1890.
Flax yarn and thread-fine spindles	320,000	356,000
Power-looms for linen weaving	500	1,560
Handlooms	36,500	11,150
Hemp and jute spindles	12,696	39,000
Power-looms for hemp and jute	873	1,440

The most important places for linen spinning are in Bohemia (Trautenau), Moravia, and Silesia, where, too, linen weaving is also chiefly carried on. Both branches of the linen industry export their products in large quantities. The manufacture of ribbons, embroidery, and lace, the two latter being carried on principally as a professional house industry in Vorarlberg and in the Bohemian Erzgebirge, also thrives. The industry in stitched stuffs is especially developed in Northern Bohemia. Ready-made men's clothes and Oriental caps (fezes) are produced on a large scale in Bohemia and Moravia.

The industry in paper suffices also for export. The total production of paper in 1890 amounted to over 1,300,000 metric centners in 191 mills. Its principal seats are Bohemia, Moravia, Lower and Upper Austria. Of eatables and drinkables, besides flour products, there are manufactured sugar, Kaffee-surrogate and chocolate, beer and brandy. Of sugar factories there were in 1897 210, with a net production of more than 7 million metric centners. Of beer breweries there were 1553, producing more than 19 million hectolitres. Of brandy distilleries there were about 1100 large, 6000 medium, and 25,000 small establishments, yielding a total production of 1,400,000 hectolitres of alcohol. The sugar industry is carried on almost exclusively in Bohemia, Moravia, Silesia, and Galicia. Beer-brewing is most active in Bohemia, Lower Austria, Moravia, and Upper Austria. The manufacture of brandy is mainly conducted in Galicia, Bohemia, Moravia, and Lower Austria, which all produce large quantities for export.

Internal communication is effected by land, water, and railways. The highways by land have a total length of 67,500 miles. Of this 10,000 miles are highways belonging to the **Communi-** state; 3560 miles belong to the provinces and districts; **cations.** the rest of the highways belong to the communes. The navigable waterways have a total length of 4050 miles, of which 60 per cent. are navigable only for rafts, 40 per cent. for ships. The waterways of greatest value as means of intercommunication are the Danube, the Elbe, the Vistula, and the Dniester. On the Danube there ply 190 steamers of the Danube Steam Navigation Company and 10 other steamers, to which have to be added 3000 rowing craft and rafts. The total goods traffic on the Danube amounts to about 7,000,000 metric centners. The Elbe is a waterway for four steam navigation companies, running within its Austrian limits about 150 steamers altogether. In all, the shipping traffic on the Elbe comprises about 13,000 ships and 2000 rafts, with a total goods traffic of 27,000,000 metric centners down the river and 5,000,000 metric centners up the river. The traffic on the Vistula at all the stations gives a total of over 8000 vessels, more than half of which, however, might be reckoned twice; the goods traffic amounts to about 2,500,000 metric centners. Other rivers with a service of steamers and sailing vessels are the Arsa (in Istria), Kerka, Zermagna, and Narenta in Dalmatia. There is,

further, shipping traffic on the Dniester, and raft traffic on the Styrian courses of the Ems, Drave, Mur, Salza, Save, and Sann.

The Austrian railways in 1898 had a total length of 11,000 miles, more than half of which is under state management. The progress of railway communication is shown in the following figures:—

	(In statute miles.)			
	1875.	1885.	1895.	1899.
Total length of railway	64,600	83,457	102,769	117,662
Amount belonging to the state	1,207	22,994	45,975	47,728
Amount worked by the state	719	32,219	54,981	67,400
For every 1000 sq. kilometres	21·5	27·8	34·3	39·2
For every 100,000 inhabitants	31·7	37·8	43·1	47·3

The work of the railways in 1899 comprised the carriage of persons and goods over a distance, altogether, of 81 million miles. The invested capital employed in the total railways amounted in 1898 to, in round numbers, 3 milliards of florins.

The post office forwarded in 1899, 1194 million missives and 4·12 milliard florins in money and articles of value, and post-office orders for 584 million florins were paid in and for 650 million florins paid out; 14,700,000 communications were sent by telegraph, and 83,400,000 conversations negotiated by telephone.

The strength of the commercial marine of Austria in 1900 was as follows:—

	Number of Vessels.	Tonnage.	Crews.
Sea-going vessels, steamers	103	178,649	3,130
„ „ sailing ships	20	13,427	223
Large coasting vessels, steamers	20	5,300	262
„ „ sailing ships	11	946	50
Small coasters, steamers	72	6,649	517
„ „ sailers	1,411	16,932	3,524
Fishing vessels, „	3,673	8,606	13,401
Numbered barks, „	7,825	18,720	12,386
Total steamers	195	190,598	3,909
„ sailing vessels	12,440	53,681	29,584
Total steamers and sailing vessels	12,635	244,279	33,493
„ „ „ „ „ 1878	7,381	257,652	26,297

The greatest navigation company is the Austrian Lloyd in Trieste, which in 1900 employed 70 ships of 165,430 tons, covered a distance of 2,000,000 nautical miles, and carried 275,000 passengers and 9,500,000 metric centners of goods.

Banks.—In Austria there were in 1898, 61 banking establishments; 44 of them joint-stock banks, and 17 banks without joint stock. The largest bank is the Austro-Hungarian Bank, common to Austria and Hungary, which possesses the monopoly of the issue of bank notes for the whole monarchy. Its joint stock amounted in 1899 to 180,000,000 crowns; the reserve fund to 36,500,000 crowns; the bank note circulation to 1,458,000,000 crowns; bullion to 1,018,000,000 crowns, of which 806,000,000 crowns were in gold and bills payable in gold. The total banks in 1898 had a balance of 6294 million crowns, with a joint stock of 671 million crowns. The Savings Banks, numbering 531, had in 1898 over 3,000,000 depositors, with a balance in their favour of 3518 million crowns.

For HUNGARY and BOSNIA AND HERZEGOVINA see under those heads.

The following is a list of the most important publications relating to Austria-Hungary as a whole and to Austria proper:—

HISTORY.—1. *The Whole Monarchy.*

The war of 1866 began a new era in the history of the Austrian empire. By the treaty of Prague the emperor surrendered the position in Germany which his ancestors had held for so many centuries; Austria and Tirol, Bohemia and Salzburg, ceased to be German, and eight million Germans were cut off from all political union with their fellow-countrymen. At the same time the surrender of Venetia completed the work of 1859, and the last remnant of the old-established Hapsburg domination in Italy ceased. The war was immediately followed by a reorganization of the Government. The *Establishment of the dual monarchy.* Magyar nation, as well as the Czechs, had refused to recognize the validity of the constitution of 1861 which had established a common parliament for the whole empire; they demanded that the independence of the kingdom of Hungary should be restored. After the defeats on the field of battle their claim could no longer be resisted, and in the negotiations the Hungarian Diet was able to make its own terms. They recognized no union between their country and the other parts of the monarchy except that which was based on the Pragmatic Sanction of 1722. All recent innovations, all attempts made during the last hundred years to absorb Hungary in a greater Austria, were revoked. An agreement was made by which the emperor was to be crowned at Pest and take the ancient oath to the Golden Bull; Hungary (including Transylvania and Croatia) was to have its own parliament and its own ministry; Magyar was to be the official language; the emperor was to rule as king; there was to be complete separation of the finances; not even a common nationality was recognized between the Hungarians and the other subjects of the emperor; a Hungarian was to be a foreigner in Vienna, an Austrian a foreigner in Budapest. A large party wished indeed that nothing should be left but a purely personal union similar to that between England and Hanover. Deak and the majority agreed, however, that the arrangements of 1722 implied, and the older constitutional practice allowed, that there should be certain institutions common to Hungary and the rest of the monarchy; these were—(1) foreign affairs, including the diplomatic and consular service; (2) the army and navy; (3) the control of the expenses required for these branches of the public service.

Recognizing in a declaratory act the legal existence of these common institutions, they also determined the method by which they should be administered. In doing so they carried out with great exactitude the principle of dualism, establishing in form a complete parity between Hungary on one side and the other territories of the king on the other. They made it a condition that there should be constitutional government in the rest of the monarchy as well as in Hungary, and a parliament in which all the other territories should be represented. From both the Hungarian and the Austrian¹ parliament there was to be elected a *Delegation*, consisting of sixty members; to these Delegations the common ministers were to be responsible, and to them the budget was to be submitted. The annual meetings were to be held alternately in Vienna and in Pest. They were very careful that

¹ For the use of this term, see section (2) on AUSTRIA below.

these Delegations should not overshadow the parliaments by which they were appointed. The Delegations were not to sit together; each was to meet separately; they were to communicate by writing, every document being accompanied by a translation in Magyar or German, as the case might be; only if after three times exchanging notes they failed to agree was there to be a common session; in that case there would be no discussion, and they were to vote in silence; a simple majority was sufficient. There were to be three ministers for common purposes—(1) for foreign affairs; (2) for war; (3) for finance; these ministers were responsible to the Delegations, but the Delegations were really given no legislative power. The minister of war controlled the common army, but even the laws determining the method by which the army was to be recruited had to be voted separately in each of the parliaments. The minister of finance had to lay before them the common budget, but they could not raise money or vote taxes; after they had passed the budget the money required had to be provided by the separate parliaments. Even the determination of the proportion which each half of the monarchy was to contribute was not left to the Delegations. It was to be fixed once every ten years by separate committees chosen for that purpose from the Austrian Reichsrath and the Hungarian Reichstag, the so-called *Quota-Deputations*. In addition to these "common affairs" the Hungarians, indeed, recognized that there were certain other matters, which it was desirable should be managed on identical principles in the two halves of the monarchy—namely, customs and excise currency; the army and common railways. For these, however, no common institutions were created; they must be arranged by agreement; the ministers must confer and then introduce identical acts in the Hungarian and the Austrian parliaments.

The main principles of this agreement were decided during the spring of 1867; but during this period the Austrians were not really consulted at all. The negotiations on behalf of the court of Vienna were entrusted to Beust, whom the emperor appointed chancellor of the empire and also minister-president of Austria. He had no previous experience of Austrian affairs, and was only anxious at once to bring about a settlement which would enable the empire to take a strong position in international politics. In the summer of 1867, however (the Austrian Reichsrath having met), the two parliaments each elected a deputation of fifteen members to arrange the financial settlement. The first matter was the debt, amounting to over 3000 million gulden, in addition to the floating debt, which had been contracted during recent years. The Hungarians laid down the principle that they were in no way responsible for debts contracted during a time when they had been deprived of their constitutional liberties; they consented, however, to pay each year 29½ million gulden towards the interest. The whole responsibility for the payment of the remainder of the interest, amounting annually to over a hundred million gulden, and the management of the debt, was left to the Austrians. The Hungarians wished that a considerable part of it should be repudiated. It was then agreed that the two states should form a Customs Union for the next ten years; the customs were to be paid to the common exchequer; all sums required in addition to this to meet the expenses were to be provided as to 30 per cent. by Hungary and as to 70 per cent. by Austria. After the financial question had been thus settled, the whole of these arrangements were then, on 21st and 24th December 1867, enacted by the two parliaments, and the system of dualism was established.

The Acts were accepted in Austria out of necessity;

but no parties were really satisfied. The Germans, who accepted the principle of dualism, were indignant at the financial arrangements; for Hungary, while gaining more than an equal share of power, paid less than one-third of the common expenses. On the other hand, according to British ideas of taxable capacity, Hungary paid, and still pays, more than her share. The Germans, however, could at least hope that in the future the financial arrangements might be revised; the complaints of the Slavonic races were political, and within the constitution there was no means of remedy, for, while the settlement gave to the Hungarians all that they demanded, it deprived the Bohemians or Galicians of any hope that they would be able to obtain similar independence. Politically, the principle underlying the agreement was that the empire should be divided into two portions; in one of these the Magyars were to rule, in the other the Germans; in either section the Slavonic races—the Serbs and Croatians, the Czechs, Poles, and Slovenians—were to be placed in a position of political inferiority.¹

The logical consistency with which the principle of Dualism was carried out is shown in a change of title. By a letter to Beust of 14th November 1868 the emperor ordered that he should henceforward be styled, not as before "Emperor of Austria, King of Hungary, King of Bohemia, etc.," but "Emperor of Austria, King of Bohemia, etc., and Apostolic King of Hungary," thereby signifying the separation of the two districts over which he rules. His shorter style is "His Majesty the Emperor and King," and "His Imperial and Apostolic Royal Majesty"; the lands over which he rules are called "The Austrian-Hungarian Monarchy" or "The Austrian-Hungarian Realm." The new terminology, "Imperial and Royal" (*Kaiserlich und Königlich*), has since then been applied to all those branches of the public service which belong to the common ministries; this was first the case with the diplomatic service; not till 1889 was it applied to the army, which for some time kept up the old style of *Kaiserlich-Königlich*; in 1895 it was applied to the ministry of the imperial house, an office always held by the minister for foreign affairs. The minister for foreign affairs was at first called the *Reichskanzler*; but in 1871, when Andrássy succeeded Beust, this was given up in deference to Hungarian feeling, for it might be taken to imply that there was a single state of which he was minister. The old style *Kaiserlich-Königlich*, the "K. K." which has become so familiar through long use, is still retained in the Austrian half of the monarchy. There are therefore, *e.g.*, three ministries of finance: the *Kaiserlich und Königlich* for joint affairs; the *Kaiserlich-Königlich* for Austrian affairs; the *Königlich* for Hungary.

The settlement with Hungary consisted then of three parts:—(1) the political settlement, which was to be permanent and has since remained part of the fundamental constitution of the monarchy; (2) the periodical financial settlement, determining the partition of the common expenses as arranged by the Quota-Deputations and ratified by the parliaments; (3) the Customs Union and the agreement as to currency—a voluntary and terminable arrangement made between the two Governments and parliaments. The history of the common affairs which fall under the management of the common ministries is, then, the history of the foreign policy of the empire and of the army. It is with this and this alone that the Delegations are occupied, and it is to this that we must now turn. The annual meetings call for little notice; they have generally been the occasion on which the foreign minister has explained and justified his policy; according to the English custom, red books, sometimes containing important despatches, have been laid before them; but the debates have caused less embarrassment to the Government than is generally the case in parliamentary assemblies, and the army budget has generally been passed with few and unimportant alterations.

¹ Baron H. de Worms. *The Austro-Hungarian Empire*. London, 1876, and Beust's *Memoirs*.

For the first four years, while Beust was chancellor, the foreign policy was still influenced by the feelings left by the war of 1866. We do not know how far there was a real intention to revenge Königgrätz and recover the position lost in Germany.

Foreign policy.

This would be at least a possible policy, and one to which Beust by his previous history would be inclined. There were sharp passages of arms with the Prussian Government regarding the position of the South German states; a close friendship was maintained with France; there were meetings of the emperor and of Napoleon at Salzburg in 1868, and the next year at Paris; the death of Maximilian in Mexico cast a shadow over the friendship, but did not destroy it. The opposition of the Hungarians and financial difficulties probably prevented a warlike policy. In 1870 there were discussions preparatory to a formal alliance with France against the North German Confederation, but nothing was signed.¹ The war of 1870 put an end to all ideas of this kind; the German successes were so rapid that Austria was not exposed to the temptation of intervening, a temptation that could hardly have been resisted had the result been doubtful or the struggle prolonged. The absorption of South Germany in the German empire took away the chief cause for friction; and from that time warm friendship, based on the maintenance of the established order, has existed between the two empires. Austria gave up all hope of regaining her position in Germany; Germany disclaimed all intention of acquiring the German provinces of Austria. Beust's retirement in 1871 put the finishing touch on the new relations. His successor, Count Andrassy, a Hungarian, established a good understanding with Bismarck; and in 1872 the visit of the Emperor Francis Joseph, accompanied by his minister, to Berlin, was the final sign of the reconciliation with his uncle. The Tsar was also present on that occasion, and for the next six years the close friendship between the three empires removed all danger of war. Three years later the full reconciliation with Italy followed, when Francis Joseph consented to visit Victor Emmanuel in the city of Venice.

The outbreak of disturbance in the Balkans ended this period of calm. The insurrection in Bosnia and Herzegovina immediately affected Austria; refugees in large numbers crossed the frontier and had to be maintained by the Government. The political problem presented was a very difficult one. The sympathy of the Slavonic inhabitants of the empire made it impossible for the Government of Vienna to regard with indifference the sufferings of Christians in Turkey.

The Eastern question.

Active support was impossible, because the Hungarians, among whom the events of 1848 had obliterated the remembrance of the earlier days of Turkish conquest, were full of sympathy for the Turks. It was a cardinal principle of Austrian policy that she could not allow the erection of new Slavonic states on her southern frontier. Moreover, the disturbances were fomented by Russian agents, and any increase of Russian influence (for which the Pan-Slavonic party was working) was full of danger to Austria. For a time the mediation of Germany preserved the good understanding between the two eastern empires. In 1875 Andrassy drafted a Note, which was accepted by the Powers, requiring Turkey to institute the reforms necessary for the good government of the provinces. Turkey agreed to do this, but the insurgents required a guarantee from the Powers that Turkey would keep her engagements. This could not be given, and the rebellion continued and spread to Bulgaria. The lead then passed

to Russia, and Austria, even after the outbreak of war, did not oppose Russian measures. At the beginning of 1877 a secret understanding had been made between the two powers, by which Russia undertook not to annex any territory, and in other ways not to take steps which would be injurious to Austria. The advance of the Russian army on Constantinople, however, was a serious menace to Austrian influence; Andrassy therefore demanded that the terms of peace should be submitted to a European conference, which he suggested should meet at Vienna. The Peace of San Stefano violated the engagements made by Russia, and Andrassy was therefore compelled to ask for a credit of 60 million gulden and to mobilize a small portion of the army; the money was granted unanimously in the Hungarian Delegation, though the Magyars disliked a policy the object of which appeared to be not the defence of Turkey against Russia, but an agreement with Russia which would give Austria compensation at the expense of Turkey; in the Austrian Deputation it was voted only by a majority of 39 to 20, for the Germans were alarmed at the report that it would be used for an occupation of part of the Turkish territory.

The active share taken by Great Britain, however, relieved Austria from the necessity of having recourse to further measures. By an arrangement made beforehand, Austria was requested at the Congress of Berlin to undertake the occupation and administration of Bosnia and Herzegovina—an

Bosnia and Herzegovina.

honourable but arduous task. The provinces could not be left to the Turks; Austria could not allow them to fall under Russian influence. The occupation was immediately begun, and 60,000 Austrian troops, under the command of General Philippovitch, crossed the frontier on 29th July. The work was, however, more difficult than had been anticipated; the Mahomedans offered a strenuous resistance; military operations were attended with great difficulty in the mountainous country; 200,000 men were required, and they did not succeed in crushing the resistance till after some months of obstinate fighting. The losses on either side were very heavy; even after the capture of Serajevo in August, the resistance was continued; and besides those who fell in battle, a considerable number of the insurgents were put to death under military law. The opposition in the Delegations, which met at the end of the year, was so strong that the Government had to be content with a credit to cover the expenses for 1879 of less than half what they had originally asked, and the supplementary estimate of 40,000,000 gulden for 1878 was not voted till the next year. In 1879 the Porte, after long delay, recognized the occupation on the distinct understanding that the sovereignty of the sultan was acknowledged. A civil administration was then established, the provinces not being attached to either half of the empire, but placed under the control of the joint minister of finance. The Government during the first two years was not very successful; the Christian population were disappointed at finding that they still had, as in the old days, to pay rent to the Mahomedan Beks. There were difficulties also between the Roman Catholics and the members of the Greek Church. In 1881 disturbances in Dalmatia spread over the frontier into Herzegovina, and another expedition had to be sent to restore order. When this was done Herr von Kallay was appointed minister, and under his judicious government order and prosperity were established in the provinces. In accordance with another clause of the Treaty of Berlin, Austria was permitted to place troops in the sanjak of Novi-Bazar, a district of great strategic importance, which separated Serbia and Montenegro, and through which the communication between Bosnia and Salonica passed. This was done in September 1879, an

¹ See General Le Brun, *Souvenirs Militaires*, 1866-70. Paris, 1895; also, Baron de Worms, *op. cit.*, and the article on BEUST.

agreement with Turkey having specified the numbers and position of the garrison. Another slight alteration of the frontier was made in the same year, when, during the delimitation of the new frontier of Montenegro, the district of Spizza was incorporated in the kingdom of Dalmatia.

The Congress of Berlin indirectly caused some difficulties with Italy. In that country was a large party which, under the name of the "Irredentists," demanded that those Italian-speaking districts, South Tirol, Istria, and Trieste, which were under Austrian rule, should be joined to Italy; there were public meetings and riots in Italy; the Austrian flag was torn down from the consulate in Venice and the embassy at Rome insulted. The excitement spread across the frontier; there were riots in Trieste, and in Tirol it was necessary to make some slight movement of troops as a sign that the Austrian Government was determined not to surrender any territory. For a short time there was apprehension that the Italian Government might not be strong enough to resist the movement, and might even attempt to realize these wishes by means of an alliance with Russia; but the danger quickly passed away.

In the year 1879 the European position of the empire was placed on a more secure footing by the conclusion of a formal alliance with Germany. In the autumn of that year Bismarck visited Vienna and arranged with Andrassy a treaty by which Germany bound herself to support Austria against an attack from Russia, Austria pledging herself to help Germany against a combined attack of France and Russia; the result of this treaty, of which the Tsar was informed, was to remove, at least for the time, the danger of war between Austria and Russia. It was the last achievement of Andrassy, who had already resigned, but it was maintained by his successor, Baron Haymerle, and after his death in 1880 by Count Kalnoky. It was strengthened in 1883 by the adhesion of Italy, for after 1881 the Italians required support, owing to the French occupation of Tunis, and after five years it was renewed. Since that time it has been the foundation on which the policy of Austria has depended, and it has survived all dangers arising either from commercial differences (as between 1880 and 1890) or national discord. The alliance was naturally very popular among the German Austrians; some of them went so far as to attempt to use it to influence internal policy, and suggested that fidelity to this alliance required that there should be a ministry at Vienna which supported the Germans in their internal struggle with the Slavs; they represented it as a national alliance of the Teutonic races, and there were some Germans in the Empire who supported them in this view. The Governments on both sides could of course give no countenance to this theory; Bismarck especially was very careful never to let it be supposed that he desired to exercise influence over the internal affairs of his ally. Had he done so, the strong anti-German passions of the Czechs and Poles, always inclined to an alliance with France, would have been aroused, and no Government could have maintained the alliance. After 1880, the exertions of Count Kalnoky again established a fairly good understanding with Russia, as was shown by the meetings of Francis Joseph with the Tsar in 1884 and 1885, but the outbreak of the Bulgarian question in 1885 again brought into prominence the opposed interests of Russia and Austria. In the December of this year Austria indeed decisively interfered in the war between Bulgaria and Serbia, for at this time Austrian influence predominated in Serbia, and after the battle of Slivnitsa the Austrian ambassador warned Prince Alexander of Bulgaria that if

he advanced farther he would be met by Austrian as well as Servian troops. But after the abdication of Alexander, Count Kalnoky stated in the Delegations that Austria would not permit Russia to interfere with the independence of Bulgaria. This decided step was required by Hungarian feeling, but it was a policy in which Austria could not depend on the support of Germany, for—as Bismarck stated—Bulgaria was not worth the bones of a single Pomeranian grenadier. Austria also differed from Russia as to the position of Prince Ferdinand of Bulgaria, and during 1886-87 much alarm was caused by the massing of Russian troops on the Galician frontier. Councils of war were summoned to consider how this exposed and distant province was to be defended, and for some months war was considered inevitable; but the danger was averted by the renewal of the Triple Alliance and the other decisive steps taken at this time by the German Government (*vide GERMANY*).¹

Since this time the foreign policy of Austria has been peaceful and unambitious; the close connexion with Germany has so far been maintained, though during the last few years it has been increasingly difficult to prevent the violent passions engendered by national enmity at home from reacting on the foreign policy of the empire; it would scarcely be possible to do so, were it not that discussions on foreign policy take place not in the parliaments but in the Delegations where the numbers are fewer and the passions cooler. In 1896 Count Kalnoky had to retire, owing to a difference with Banffy, the Hungarian minister, arising out of the struggle with Rome. He was succeeded by Count Goluchowski, the son of a well-known Polish statesman. In 1898 the expulsion of Austrian subjects from Prussia, in connexion with the anti-Polish policy of the Prussian Government, caused a passing irritation, to which Count Thun, the Austrian minister, gave expression. The chief objects of the Government in recent years have been to maintain Austrian trade and influence in the Balkan States by the building of railways, by the opening of the Danube for navigation, and by commercial treaties with Rumania, Serbia, and Bulgaria; since the abdication of King Milan especially, the affairs of Serbia and the growth of Russian influence in that country have caused serious anxiety.

The disturbed state of European politics and the great increase in the military establishments of other countries made it desirable for Austria also to strengthen her military resources. The bad condition of the finances rendered it, however, impossible to carry out any very great measures. In 1868 there had been introduced compulsory military service in both Austria and Hungary; the total of the army available in war had been fixed at 800,000 men. Besides this joint army placed under the joint ministry of war, there was in each part of the monarchy a separate militia and a separate minister for national defence. In Hungary this national force or *honved* was kept quite distinct from the ordinary army; in Austria, however (except in Dalmatia and Tirol, where there was a separate local militia), the Landwehr, as it was called, was practically organized as part of the standing army. At the renewal of the *Ausgleich* in 1877 no important change was made, but in 1882 the system of compulsory service was extended to Bosnia and Herzegovina, and a reorganization was carried out, including the introduction of army corps and local organization on the Prussian plan. This was useful for the purposes of speedy mobilization, though there was some danger that the local and national spirit might penetrate into the

¹ Sir Charles Dilke, *The Present Position of European Politics*, London, 1887.

army. In 1886 a law was carried in either parliament creating a Landsturm, and providing for the arming and organization of the whole male population up to the age of forty-two in case of emergency, and in 1887 a small increase was made in the annual number of recruits. A further increase was made in 1892-93. In contrast, however, with the military history of other continental powers, that of Austria shows a small increase in the army establishment. Of recent years there have been signs of an attempt to tamper with the use of German as the common language for the whole army. This, which is now the principal remnant of the old ascendancy of German, and the one point of unity for the whole empire, is a matter on which the Government and the emperor allow no concession, but in the Hungarian parliament protests against it have been raised, and in 1899 and 1900 it was necessary to punish recruits from Bohemia, who answered the roll call in the Czechish "zde" instead of the German "hier."

In those matters which belong to the periodical and terminable agreement, the most important is the Customs Union, which was established in 1867, and it is convenient to treat separately the commercial policy of the dual state.¹ At first the customs tariff in Austria-Hungary, as in most other countries, was based on a number of commercial treaties with Germany, France, Italy, Great Britain, &c., each of which specified the maximum duties that could be levied on certain articles, and all of which contained a "most favoured nation" clause. The practical result was a system very nearly approaching to the absence of any customs duties, and for the period for which these treaties lasted a revision of the tariff could not be carried out by means of legislation. After the year 1873, a strong movement in favour of protective duties made itself felt among the Austrian manufacturers who were affected by the competition of German, English, and Belgian goods, and Austria was influenced by the general movement in economic thought which about this time caused the reaction against the doctrines of free trade. Hungary, on the other hand, was still in favour of free trade, for there were no important manufacturing industries in that country, and it required a secure market for agricultural produce. After 1875 the commercial treaties expired; Hungary thereupon also gave notice to terminate the commercial union with Austria, and negotiations began as to the principle on which it was to be renewed. This was done during the year 1877, and in the new treaty, while raw material was still imported free of duty, a low duty was placed on textile goods as well as on corn, and the excise on sugar and brandy was raised. All duties, moreover, were to be paid in gold—this at once involving a considerable increase. The tariff treaties with Great Britain and France were not renewed, and all attempts to come to some agreement with Germany broke down, owing to the change of policy which Bismarck was adopting at this period. The result was that the system of commercial treaties ceased, and Austria-Hungary was free to introduce a fresh tariff depending simply on legislation, an "autonomous tariff" as it is called. With Great Britain, France, and Germany, there was now only a "most favoured nation" agreement; fresh commercial treaties were made with Italy (1879), Switzerland, and Servia (1881). During 1881-82 Hungary, desiring means of retaliation against the duties on corn and the impediments to the importation of cattle recently introduced into Germany, withdrew her opposition to

protective duties; the tariff was completely revised, protective duties were introduced on all articles of home production, and high finance duties on other articles such as coffee and petroleum. At the same time special privileges were granted to articles imported by sea, so as to foster the trade of Trieste and Fiume; as in Germany, a subvention was granted to the great shipping companies, the Austrian Lloyd and Adria; the area of the Customs Union was enlarged so as to include Trieste, Istria, and Dalmatia, as well as Bosnia and Herzegovina. In 1887 a further increase of duties was laid on corn (this was at the desire of Hungary as against Rumania, for a vigorous customs war was being carried on at this time) and on woollen and textile goods. Austria therefore during these years completely gave up the principle of free trade, and adopted a nationalist policy similar to that which prevailed in Germany. A peculiar feature of these treaties was that the Government was empowered to impose an additional duty (Retorsion Zoll) on goods imported from countries in which Austria-Hungary received unfavourable treatment. In 1881 this was fixed at 10 per cent. (5 per cent. for some articles), but in 1887 it was raised to 30 and 15 per cent. respectively. In 1892 Austria-Hungary joined with Germany, Italy, Belgium, and Switzerland in commercial treaties to last for twelve years, the object being to secure to the states of Central Europe a stable and extended market; for the introduction of high tariffs in Russia and America had crippled industry. Two years later Austria-Hungary also arranged with Russia a treaty similar to that already made between Russia and Germany; the reductions in the tariff secured in these treaties were applicable also to Great Britain, with which there still was a most favoured nation treaty. The system thus introduced gave commercial security till the year 1903.

The result of these and other laws was an improvement in financial conditions, which enabled the Government at last to take in hand the long-delayed task of reforming the currency. Hitherto the currency had been partly in silver (guilder), the "Austrian Currency" which had been introduced in 1857, partly in paper money, which took the form of notes issued by the Austro-Hungarian Bank. This institution had, in 1867, belonged entirely to Austria; it had branches in Hungary, and its notes were current throughout the monarchy, but the direction was entirely Austrian. The Hungarians had not sufficient credit to establish a national bank of their own, and at the settlement of 1877 they procured, as a concession to themselves, that it should be converted into an Austro-Hungarian bank, with a head office at Pest as well as at Vienna, and with the management divided between the two countries. This arrangement was renewed in 1887. In 1848 the Government had been obliged to authorize the bank to suspend cash payments, and the wars of 1859 and 1866 had rendered abortive all attempts to renew them. The notes therefore formed an inconvertible paper currency. The bank by its charter had the sole right of issuing notes, but during the war of 1866 the Government, in order to raise money, had itself issued notes (*staatsnoten*) to the value of 312 million guilders, thereby violating the charter of the bank. The operation begun in 1892 was therefore threefold: (1) the substitution of a gold for a silver currency; (2) the redemption of the *staatsnoten*; (3) the resumption of cash payments by the bank.

In 1867 Austria-Hungary had taken part in the monetary conference which led to the formation of the Latin Union; it was intended to join the Union, but this was not done. A first step, however, had been taken in this direction by the issue of gold coins of the value of eight and four guildens. No attempt was made, however, to regulate the relations of these coins to the "Austrian" silver coinage; the two issues were not brought into connexion, and every payment was made in silver, unless it was definitely agreed that it should be paid in gold. In 1879, owing to the continued depreciation of silver, the free coinage of silver was suspended. In 1892 laws introducing a completely new coinage were carried in both parliaments, in accordance with agreements made by the ministers. The unit in the new issue was to be the krone, divided into 100 heller; the krone being almost of the same value as the franc. (The twenty-krone piece in gold weighs 6.775 gr., the twenty-franc piece 6.458.) The gold krone was equal

¹ Matlekovits. *Die Zollpolitik des Oesterreichisch-Ungarischen Monarchie*, Leipzig, 1891, gives the Hungarian point of view.—Bazant. *Die Handelspolitik Oesterreich-Ungarns*, 1875-92. Leipzig, 1894.

to 42 of the gold gulden, and it was declared equal to 5 of the silver gulden, so much allowance being made for the depreciation of silver. The first step towards putting this Act into practice was the issue of one-krone pieces (silver), which circulated as half gulden, and of nickel coins; all the copper coins and other silver coins were recalled, the silver gulden alone being left in circulation. The coinage of the gold four- and eight-gulden was suspended. Nothing more could be done till the supply of gold had been increased. The bank was required to buy gold (during 1892 it bought over forty M. gulden), and was obliged to coin into twenty- or ten-krone pieces all gold brought to it for that purpose. Then a loan of 150 M. gulden at 4 per cent. was made, and from the gold (chiefly bar gold and sovereigns) which Rothschild, who undertook the loan, paid in, coins of the new issue were struck to the value of over 34 million krone. This was, however, not put into circulation; it was used first for paying off the *staatsnoten*. By 1894 the state was able to redeem them to the amount of 200 million gulden, including all those for one gulden. It paid them, however, not in gold, but in silver (one-krone pieces and gulden) and in bank notes, the coin and notes being provided by the bank, and in exchange the newly-coined gold was paid to the bank to be kept as a reserve to cover the issue of notes. At the same time arrangements were made between Austria and Hungary to pay off about 80 million of exchequer bills which had been issued on the security of the Government salt-works, and were therefore called "*salinenscheinen*." In 1899 the remainder of the *staatsnoten* (112 million gulden) were redeemed in a similar manner. The bank had in this way acquired a large reserve of gold, and in the new charter which was (after long delay) passed in 1899, a clause was introduced requiring the resumption of cash payments, though this was not to come into operation immediately. Then from 1st January 1900 the old reckoning by gulden was superseded, that by krone being introduced in all Government accounts, the new silver being made a legal tender only for a limited amount. For the time, however, the old gulden was left in circulation, payments made in them, at the rate of two krone to one gulden, being legal up to any amount.

This important reform has thereby been brought to a satisfactory conclusion, and at a time when the political difficulties had reached a most acute stage. It is indeed remarkable that notwithstanding the complicated machinery of the dual monarchy, and the numerous obstacles which have to be overcome before a reform affecting both countries can be carried out, the financial, the commercial, and the foreign policy has been conducted since 1870 with success. The credit of the state has risen, the chronic deficit has disappeared, the currency has been put on a sound basis, and part of the unfunded debt has been paid off. Universal military service has been introduced, and all this has been done in the presence of difficulties greater than existed in any other civilized country.

Each of the financial and economic reforms described above was, of course, the subject of a separate law, but, so far as they are determined at the general settlement which takes place between Austria and Hungary every ten years, they are comprised under the expression "*Ausgleich*," which includes especially the determination of the Quota, and to this extent they are all dealt with together as part of a general settlement and bargain. In this settlement a concession on commercial policy would be set off against a gain on the financial agreement; e.g., in 1877 Austria gave Hungary a share in the management of the bank, while the arrangement for paying the bonus on exported sugar was favourable to Austria; on the other hand, since the increased duty on coffee and petroleum would fall more heavily on Austria, the Austrians wished to persuade the Hungarians to pay a larger quota of the common expenses, and there was also a dispute whether Hungary was partly responsible for a debt of 80 M. gulden to the bank. Each measure had therefore to be considered not only on its own merits, but in relation to the general balance of advantage, and an amendment in one might bring about the rejection of all. The whole series of Acts had to be carried in two parliaments, each open to the influence of national jealousy and race hatred in its most extreme form, so that the negotiations have been conducted under serious difficulties, and the periodical settlement has always been a time of great anxiety. The first settlement occupied two full years,

from 1876, when the negotiations began, to June 1878, when at last all the Bills were carried successfully through the two parliaments; and it was necessary to prolong the previous arrangements (which expired at the end of 1877) till the middle of 1878. First the two ministries had to agree on the drafts of all the Bills; then the Bills had to be laid before the two parliaments. Each parliament elected a committee to consider them, and the two committees carried on long negotiations by notes supplemented by verbal discussions. Then followed the debates in the two parliaments; there was a ministerial crisis in Austria, because the House refused to accept the tax on coffee and petroleum which was recommended by the ministers; and finally a great council of all the ministers, with the emperor presiding, determined the compromise that was at last accepted. In 1887 things went better; there was some difficulty about the tariff, especially about the tax on petroleum, but Count Taaffe had a stronger position than the Austrian ministers of 1877. Ten years later, on the third renewal, the difficulties were still greater. They sprang from a double cause. First the Austrians were determined to get a more favourable division of the common expenses; that of 1867 still continued, although Hungary had grown relatively in wealth.¹ Moreover a proposed alteration in the taxes on sugar would be of considerable advantage to Hungary; the Austrians therefore demanded that henceforth the proportion should be not 68·6 : 31·4 but 58 : 42. On this there was a deadlock; all through 1897 and 1898 the Quota Deputations failed to come to an agreement. This, however, was not the worst. Parliamentary Government in Austria had broken down; the opposition had recourse to obstruction, and no business could be done. Their object was to drive out the Badeni Government, and for that reason the obstruction was chiefly directed against the renewal of the *Ausgleich*; for, as this was the first necessity of state, no Government could remain in office which failed to carry it through. The extreme parties of the Germans and the anti-Semites were also, for national reasons, opposed to the whole system. When, therefore, the Government at the end of 1897 introduced the necessary measures for prolonging the existing arrangements provisionally till the differences with Hungary had been settled, scenes of great disorder ensued (see section AUSTRIA, pages 26, 27), and at the end of the year the financial arrangements had not been prolonged, and neither the Bank Charter nor the Customs Union had been renewed. The Government, therefore (Badeni having resigned), had to proclaim the necessary measures by imperial warrant. Next year it was even worse, for there was obstruction in Hungary as well as in Austria; the Quota Deputations again came to no agreement, and the proposals for the renewal of the Bank Charter, the reform of the currency, the renewal of the Customs Union, and the new taxes on beer and brandy, which were laid before parliament both at Vienna and Pest, were not carried in either country; this time, therefore, the existing arrangements had to be prolonged provisionally by imperial and royal warrant both in Austria and Hungary. During 1899 parliamentary peace was restored in Hungary by the resignation of Banffy; in Austria, however, though there was again a change of ministry the only result was that the Czechs imitated the example of the Germans and resorted to obstruction so that still no business could be done. The Austrian ministry, therefore, came to an agreement with the Hungarians that the terms of the new *Ausgleich* should be finally proclaimed in Austria by

¹ The only change was that as the military frontier had been given over to Hungary, Hungary in consequence of this addition of territory had to pay 2 per cent., the remaining 98 per cent. being divided as before, so that the real proportion was 31·4 and 68·6.

imperial warrant; the Hungarians only giving their assent to this in return for considerable financial concessions.

The main points of the agreement were: (1) the Bank Charter was to be renewed till 1910, the Hungarians receiving a larger share in the direction than they had hitherto enjoyed; (2) the Customs Union so far as it was based on a reciprocal and binding treaty lapsed, both sides, however, continuing it in practice, and promising to do so until 31st December 1907. Not later than 1901 negotiations were to be begun for a renewal of the alliance, and if possible it was to be renewed from the year 1908, in which year the commercial treaties expire. If this is done, then the tariff is to be revised before any fresh commercial treaties are made. If it is not done, then no fresh treaties are to be made extending beyond the year 1907, so that if the Commercial Union of Austria and Hungary is not renewed before 1907, each party will be able to determine its own policy unshackled by any previous treaties.¹ These arrangements in Hungary received the sanction of the Reichstag; but this could not be procured in Austria, and they were therefore proclaimed by imperial warrant; first of all, on 20th July, the new duties on beer, brandy, and sugar; then on 23rd September the Bank Charter, &c. In November the Quota Deputations at last agreed that Hungary should henceforward pay 33½, a very small increase, and this was also in Austria proclaimed in the same way. The result is that a working agreement has been made, by which the Union is preserved for a few years; the fact that this was done, notwithstanding the political difficulties, being the best proof of the great importance which the financial and commercial union has for the whole monarchy.

In Austria all classes regard with the most serious discontent an arrangement by which their share of the common expenses is so great. Even in such matters as the management and opening up of new railways, the Hungarians generally make terms very advantageous to themselves, e.g., in Bosnia the first railways built are those which open up Hungarian traffic, though Austria provides two-thirds of the capital. All protests on the part of the Austrians are, however, unavailing because of the weakness arising from the political quarrels between the different races. Experience shows that the Hungarian ministers can generally depend on the united support of all parties in their discussions with Austria; in Austria

this is not the case, for while all parties complain of the unfair burdens laid upon them, they will not join to support the ministry. It is this political disunion which brings it about that in determining the policy of the joint state the Hungarians have more influence than the Austrians; on those occasions when the Delegations have been unable to agree, and a common meeting has been held, the Hungarian view has always prevailed, for all the Hungarian Delegation vote for the proposals of their own side, while the minority in the Austrian Delegation has voted against the proposals which have been adopted by the majority. This has happened because the political principle on which the dual monarchy is founded does not correspond with facts. It was assumed that in the Austrian half of the empire the Germans would be sufficiently powerful to rule and control the other races as the Magyars do in the other; but experience has shown that they are unable to do so, while in attempting the task they have brought about a condition of political disorganization bordering on civil war, and making them helpless in their relations with Hungary. For the causes of this state of things we must turn to the history of Austria.

2. Austria Proper.

As explained at the opening of the geographical section on the Whole Monarchy, the name Austria is used for convenience to designate those portions of the possessions of the house of Hapsburg, which were not included by the settlement of 1867 among the lands of the Hungarian crown. The separation of Hungary made it necessary to

determine the method by which these territories² were henceforth to be governed. It was the misfortune of the country that there was no clear legal basis on which new institutions could be erected. Each of the territories was a separate political unit with a separate history, and some of them had a historic claim to a large amount of self-government; in many the old feudal estates had survived till 1848. Since that year the empire had been the subject of numerous experiments in government; by the last, which began in 1860, Landtags or Diets have been instituted in each of the territories on a nearly uniform system and with nearly identical powers, and by the constitution published in February 1861 (the February Constitution, as it is called), which is still the ultimate basis for the Government, there was instituted a *Reichsrath* or parliament for the whole empire; it consisted of a House of Lords, in which sat the archbishops and prince bishops, members of the imperial family, and other members appointed for life, besides some hereditary members, and a chamber of deputies. The members of the latter for each territory were not chosen by direct election, but by the Landtags. The Landtags themselves were elected for six years; they were chosen generally (there were slight local differences) in the following way: (a) a certain number of bishops and rectors of universities sat in virtue of their office; (b) the rest of the members were chosen by four electoral bodies or *curiæ*,—(1) the owners of estates which before 1848 had enjoyed certain feudal privileges, the so-called great proprietors; (2) the chambers of commerce; (3) the towns; (4) the rural districts. In the two latter classes all had the suffrage who paid at least ten gulden in direct taxes. The districts were so arranged as to give the towns a very large representation in proportion to their populations. In Bohemia, e.g., the Diet consisted of 241 members: of these five were *ex-officio* members; the feudal proprietors had seventy; the towns and chambers of commerce together had eighty-seven; the rural districts seventy-nine. The electors in the rural districts were 236,000, in the towns 93,000. This arrangement seems to have been deliberately made by Schmerling, so as to give greater power to the German inhabitants of the towns; the votes of the proprietors would moreover nearly always give the final decision to the court and the Government, for the influence exercised by the Government over the nobility would generally be strong enough to secure a majority in favour of the Government policy.

This constitution had failed; territories so different in size, history, and circumstances, were not contented with similar institutions, and a form of self-government which satisfied Lower Austria and Salzburg did not satisfy Galicia and Bohemia. The Czechs of Bohemia, like the Magyars, had refused to recognize the common parliament on the ground that it violated the historic rights of the Bohemian as of the Hungarian crown, and in 1865 the constitution of 1861 had been superseded, while the territorial Diets

² It is impossible to avoid using the word "Austria" to designate these territories, though it is probably incorrect. Officially the word "Austria" is not found, and though the sovereign is emperor of Austria, an Austrian empire appears not to exist; the territories are spoken of in official documents as "the territories represented in the Reichsrath." The Hungarians and the German party in Austria have expressed their desire that the word Austria should be used, but it has not been gratified. On the other hand, expressions such as "Austrian citizens," "Austrian law," are found. The reason of this peculiar use is probably twofold. On the one hand, a reluctance to confess that Hungary is no longer in any sense a part of Austria; on the other hand, the refusal of the Czechs to recognize that their country is part of Austria. Sometimes the word *Erbländer*, which properly is applied only to the older ancestral dominions of the house of Hapsburg, is used for want of a better word.

¹ *Jahrbuch für Gesetzgebung des deutschen Reichs*, January 1900.

remained. In 1867 it was necessary once more to summon, in some form or another, a common parliament for the whole of Austria, by which the settlement with Hungary could be ratified.

This necessity brought to a decisive issue the struggle between the parties of the Centralists and Federalists.

Centralists and Federalists. The latter claimed that the new constitution must be made by agreement with the territories; the former maintained that the constitution of 1861 was still valid, and demanded that in accordance with it the Reichsrath should be summoned and a "constitutional" Government restored. The difference between the two parties was to a great extent, though not entirely, one of race. The kernel of the empire was the purely German district, including Upper and Lower Austria, Salzburg, Tirol (except the south), and Vorarlberg, all Styria except the southern districts, and a large part of Carinthia. There was strong local feeling, especially in Tirol, but it was local feeling similar to that which formerly existed in the provinces of France; among all classes and parties there was great loyalty both to the ruling house and to the idea of the Austrian state; but while the Liberal party, which was dominant in Lower Austria and Styria, desired to develop the central institutions, there was a strong Conservative and Clerical party which supported local institutions as a protection against the Liberal influence of a centralized parliament and bureaucracy, and the bishops and clergy were willing to gain support in the struggle by alliance with the Federalists.

Very different was it in the other territories where the majority of the population was not German—and where there was a lively recollection of the time when

The Slavonic lands. they were not Austrian. With Palacky, they said, "We existed before Austria; we shall continue to exist after it is gone." Especially was this the case in Bohemia. In this great country, the richest part of the Austrian dominions, where over three-fifths of the population were Czech, national feeling was supported by the appeal to historic law. A great party, led by Palacky and Rieger, demanded the restoration of the Bohemian monarchy in its fullest extent, including Moravia and Silesia, and insisted that the emperor should be crowned in Prague as his predecessors had been, and that Bohemia should have a position in the empire similar to that obtained by Hungary. Not only did the party include all the Czechs, but they were supported by many of the great nobles who were of German descent, including Count Leo Thun, his brother-in-law Clam-Martinicz, and Prince Schwarzenberg, Cardinal Archbishop of Prague, who hoped in a self-governing kingdom of Bohemia to preserve that power which was threatened by the German Liberals. The feudal nobles had great power arising from their wealth, the great traditions of their families, and the connexion with the court, and by the electoral law they had a large number of representatives in the Diet. On the other hand the Germans of Bohemia, fearful of falling under the control of the Czechs, were the most ardent advocates of centralization. The Czechs were supported also by their fellow-countrymen in Moravia, and some of the nobles, headed by Count Belcredi, brother of the minister; but in Brunn there was a strong German party. In Silesia the Germans had a considerable majority, and as there was a large Polish element which did not support the Czechs, the Diet refused to recognize the claims of the Bohemians.

The Poles of Galicia stood apart from the other Slavonic races. The German-speaking population was very small, consisting chiefly of Government officials, railway servants, and Jews; but there was a large minority (some 43 per cent.) of Ruthenians. The Poles wished to gain as much

autonomy as they could for their own province, but they had no interest in opposing the centralization of other parts; they were satisfied if Austria would surrender the Ruthenians to them. They were little influenced by the pan-Slavonic agitation; it was desirable for them that Austria, which gave them freedom and power, should continue strong and united. Their real interests were outside the monarchy, and they did not cease to look forward to a restoration of the Polish kingdom. The great danger was that they might entangle Austria in a war with Russia.

The southern Slavs had neither the unity, nor the organization, nor the historical traditions of the Czechs and Poles; but the Slovenians, who formed a large majority of the population in Carniola and a considerable minority in the adjoining territory of Carinthia and the south of Styria, demanded that their language should be used for purposes of government and education. Their political ideal was an "Illyrian" kingdom, including Croatia and all the south Slavonians in the coast district, and a not very successful movement had been started to establish a so-called Illyrian language, which should be accepted both by Croats and Slovenians. There was, however, another element in the southern districts, viz., the Serbs, who, though of the same race and language as the Croats, were separated from them by religion. Belonging to the Orthodox Church they were attracted by Russia. They were in constant communication with Serbia and Montenegro; and their ultimate hope, the creation of a great Servian kingdom, was less easy to reconcile with loyalty to Austria. Of late years attempts have been made to turn the Slovenian national movement into this direction, and to attract the Slovenians also towards the Orthodox non-Austrian Slavs.

In the extreme south of Dalmatia is a small district which had not formed part of the older duchy of Dalmatia, and had not been joined to the Austrian empire till 1814; in former years **South Dalmatia.** part of it formed the republic of Ragusa, and the rest belonged to Albania. The inhabitants of this part, who chiefly belonged to the Greek Church, still kept up a close connexion with Albania and with Montenegro, and Austrian authority was maintained with difficulty. Disturbances had already broken out once before; and in 1869 another outbreak took place. This district had hitherto been exempted from military service; by the law of 1869, which introduced universal military service, those who had hitherto been exempted were required to serve, not in the regular army but in the militia. The inhabitants of the district round the Bocche de Cattaro (the Bocchese, as they are commonly called) refused to obey this order, and when a military force was sent it failed to overcome their resistance; and by an agreement made at Knežlac in December 1869, Rodics, who had taken command, granted the insurgents all they asked and a complete amnesty. After the conquest of Bosnia another attempt was made to enforce military service; once more a rebellion broke out, and spread to the contiguous districts of Herzegovina. This time, however, the Government, whose position in the Balkans had been much strengthened by the occupation of the new provinces, did not fear to act with decision. A considerable force was sent under Jovanowitch; they were supported from sea by the navy, and after the taking of Crevosca the rebellion was crushed. An amnesty was proclaimed, but the greater number of the insurgents sought refuge in Montenegro rather than submit to military service.

The Italians of Trieste and Istria were the only people of the empire who really desired separation from Austria; annexation to Italy was the aim of the *Italianissimi*, as they were called. The feeling was less strong in Tirol, where, except in the city of Trent, they seem chiefly to have wished for separate local institutions, so that they should no longer be governed from Innsbruck. The Italian-speaking population on the coast of Dalmatia only asked that the Government should uphold them against the pressure of the Slavonic races in the interior, and for this reason were ready to support the German constitutionalists.

The party of centralization was then the Liberal German party, supported by a few Italians and the Ruthenians;

and as years went by it was to become the National German party. They hoped by a common parliament to create the feeling of a common Austrian nationality, by German schools to spread the use of the German language. Every grant of self-government to the territories must diminish the influence of the Germans, and bring about a restriction in the use of the German language; moreover, in countries such as Bohemia, full self-government would almost certainly mean that the Germans would become the subject race. This was a result which they could not accept. It was intolerable to them that just at the time when the national power of the non-Austrian Germans was so greatly increased, and the Germans were becoming the first race in Europe, they themselves should resign the position as rulers which they had won during the last three hundred years. They maintained, moreover, that the ascendancy of the Germans was the only means of preserving the unity of the monarchy; German was the only language in which the different races could communicate with one another; it must be the language of the army, the civil service, and the parliament. They laid much stress on the historic task of Austria in bringing German culture to the half-civilized races of the east. They demanded, therefore, that all higher schools and universities should remain German, and that so far as possible the elementary schools should be Germanized. They looked on the German schoolmaster as the apostle of German culture, and they looked forward to the time when the feeling of a common Austrian nationality should obscure the national feeling of the Slavs, and the Slavonic idioms should survive merely as the local dialects of the peasantry, the territories becoming merely the provinces of a united and centralized state. The total German population was not quite a third of the whole. The maintenance of their rule was therefore only possible by the exercise of great political ability, the more so, since, as we have seen, they were not united among themselves, the clergy and Feudal party being opposed to the Liberals. Their watchword was the constitution of 1861, which had been drawn up by their leaders; they demanded that it should be restored, and with it parliamentary government. They called themselves, therefore, the Constitutional party. But the introduction of parliamentary government really added greatly to the difficulty of the task before them. In the old days German ascendancy had been secured by the common army, the civil service, and the court. As soon, however, as power was transferred to a parliament, the Germans must inevitably be in a minority, unless the method of election was deliberately arranged so as to give them a majority. Parliamentary discussion, moreover, was sure to bring out those national differences which it was desirable should be forgotten, and the elections carried into every part of the empire a political agitation which was very harmful when each party represented a different race.

The very first events showed one of those extraordinary changes of policy so characteristic of modern Austrian history. The decision of the Government on the constitutional question was really determined by immediate practical necessity. The Hungarians required that the settlement should be ratified by a parliament, therefore a parliament must be procured which would do this. It must be a parliament in which the Germans had a majority, for the system of dualism was directly opposed to the ambitions of the Slavs and the Federalists. Belcredi, who had come into power in 1865 as a Federalist, and had suspended the constitution on the 2nd January, ordered new elections for the Landtags, which were then to elect deputies to an extraordinary Reichsrath which should consider the Ausgleich. The wording of the decree

implied that the February Constitution did not exist as of law; the Germans and Liberals maintaining that it did exist, and that changes could only be introduced by a regular Reichsrath summoned in accordance with it, protested against the decree, and, in some cases, threatened not to take part in the elections. As the Federalists were all opposed to the Ausgleich, it was clear that a Reichsrath chosen in these circumstances would refuse to ratify it, and this was probably Belcredi's intention. As the existence of the empire would thereby be endangered, Beust interfered; Belcredi was dismissed, Beust himself became minister-president in February 1867, and a new edict was issued from Vienna ordering the Landtags to elect a Reichsrath, according to the constitution, which was now said to be completely valid. Of course, however, those Landtags in which there was a Federalist majority, viz., those of Bohemia, Moravia, Carinthia, and Tirol, which were already pledged to support the January policy of the Government, did not acquiesce in the February policy; and they refused to elect except on terms which the Government could not accept. The first three were immediately dissolved. In the elections which followed in Bohemia the influence of the Government was sufficient to secure a German majority among the landed proprietors; the Czechs, who were therefore in a minority, declared the elections invalid, refused to take any part in electing deputies for the Reichsrath, and seceded altogether from the Landtag. The result was that Bohemia now sent a large German majority to Vienna, and the few Czechs who were chosen refused to take their seat in the parliament. Had the example of the Czechs been followed by the other Slavonic races it would still have been difficult to get together a Reichsrath to pass the Ausgleich. It was, however, easier to deal with the Poles of Galicia, for they had no historical rights to defend; and by sending delegates to Vienna they would not sacrifice any principle or prejudice any legal claim; they had only to consider how they could make the best bargain. Their position was a strong one; their votes were essential to the Government, and the Government could be useful to them; it could give them the complete control over the Ruthenians. A compact then was easily arranged.

Crisis of 1867.

Beust's compact with the Poles.

Beust promised them that there should be a special minister for Galicia, a separate board for Galician education, that Polish should be the language of instruction in all secondary schools, that Polish instead of German should be the official language in the law courts and public offices, Ruthenian being only used in the elementary schools under strict limitations. On these terms the Polish deputies, led by Ziemiakowski, agreed to go to Vienna and vote for the Ausgleich.

When the Reichsrath met, the Government had a large majority; and in the House, in which all the races except the Czechs were represented, the Ausgleich was ratified almost unanimously. This having been done, it was possible to proceed to special legislation for the territories, which were henceforward officially known as "the territories represented in the Reichsrath." A series of fundamental laws were carried, which formally established parliamentary government, with responsibility of ministers, and complete control over the budget, and there were included a number of clauses guaranteeing personal rights and liberties in the way common to all modern constitutions. The influence of the Poles was still sufficient to secure considerable concessions to the wishes of the Federalists, since if they did not get what they wished they would leave the House, and the Slovenians, Dalmatians, and Tirolese,

The constitution of 1867.

would certainly follow them. Hence the German Liberals were prevented from introducing direct elections to the Reichsrath, and the functions of the Reichsrath were slightly less extensive than they had hitherto been. Moreover the Delegation was to be chosen not by the House as a whole, but by the representatives of the separate territories. This is one reason for the comparative weakness of Austria as compared with Hungary, where the Delegation is elected by each House as a whole; the Bohemian representatives, *e.g.*, meet and choose 10 delegates, the Galicians 7, those from Trieste 1; the Delegation is therefore not representative of the majority of the Chamber of Deputies, but includes representatives of all the groups which there may be opposing the Government, and they can carry on their opposition even in the Delegation. So it came about in 1869, that on the first occasion when there was a joint sitting of the Delegations to settle a point in the budget, which Hungary had accepted and Austria rejected, the Poles and Tirolese voted in favour of the Hungarian proposal.

As soon as these laws had been carried (Dec. 1867), Beust retired from the post of minister-president; and in accordance with constitutional practice a parliamentary ministry was appointed entirely from the ranks of the Liberal majority; a ministry generally known as the "Burger Ministerium" in which Giskra and Herbst—the leaders of the German party in Moravia and Bohemia—were the most important members. Austria now began its new life as a modern constitutional state. From this time the maintenance of the revised constitution of 1867 has been the watchword of what is called the Constitutional party. The first use which the new Government made of their power was to settle the finances, and in this their best work was done. Among them were nearly all the representatives of trade and industry, of commercial enterprise and financial speculation; they were the men who hoped to make Austria a great industrial state, and at this time they were much occupied with railway enterprise. Convinced free-traders, they hoped by private energy to build up the fortunes of the country, parliamentary government—which meant for them the rule of the educated and well-to-do middle class—being one of the means to this end. They accepted the great burden of debt which the action of Hungary imposed upon the country, and rejected the proposals for repudiation, but notwithstanding the protest of foreign bond-holders they imposed a tax of 16 per cent. on all interest on the debt. They carried out an extension of the commercial treaty with Great Britain by which a further advance was made in the direction of free trade.

Of equal importance was their work in freeing Austria from the control of the Church, which checked the intellectual life of the people. The concordat of 1855 had given the Church complete freedom in the management of all ecclesiastical affairs; there was full liberty of intercourse with Rome, the state gave up all control over the appointment of the clergy, and in matters of church discipline the civil courts had no voice—the clergy being absolutely subject to the power of the bishops, who could impose temporal as well as spiritual penalties. The state had even resigned to the Church all authority over some departments of civil life, and restored the authority of the canon law. This was the case as regards marriage; all disputes were to be tried before ecclesiastical courts, and the marriage registers were kept by the priests. All the schools were under the control of the Church; the bishops could forbid the use of books prejudicial to religion; in elementary schools all teachers were subject to the inspection of the

Church, and in higher schools only Roman Catholics could be appointed. It had been agreed that the whole education of the Roman Catholic youth, in all schools, private as well as public, should be in accordance with the teaching of the Roman Catholic Church. The authority of the Church extended even to the universities. Some change in this system was essential; the Liberal party demanded that the Government should simply state that the concordat had ceased to exist. To this, however, the emperor would not assent, and there was a difficulty in overthrowing an act which took the form of a treaty. The Government wished to come to some agreement by friendly discussion with Rome, but Pius IX. was not willing to abate anything of his full claims. The ministry therefore proceeded by internal legislation, and in 1868 introduced three laws: (1) a marriage law transferred the decisions on all questions of marriage from the ecclesiastical to the civil courts, abolished the authority of the canon law, and introduced civil marriage in those cases where the clergy refused to perform the ceremony; (2) the control of secular education was taken from the Church, and the management of schools transferred to local authorities which were to be created by the Landtags; (3) complete civil equality between Catholics and non-Catholics was established. These laws, notwithstanding the protest of all the bishops, led by Cardinal Rauscher, archbishop of Vienna, who appealed directly to the emperor, were carried through both Houses in May amid almost unparalleled excitement, and at once received the imperial sanction.

The ministry had the enthusiastic support of the German population in the towns. They were also supported by the teaching profession, which desired emancipation from ecclesiastical control, and hoped that German schools and German railways were to complete the work which Joseph II. had begun. But the hostility of the Church was dangerous. The pope, in an allocution of 22nd June 1868, declared that these "damnable and abominable laws" which were "contrary to the concordat, to the laws of the Church, and to the principles of Christianity," were "absolutely and for ever null and void." The natural result was that when they were carried into effect the bishops in many cases refused to obey. They claimed that the laws were inconsistent with the concordat, that the concordat still was in force, and that the laws were consequently invalid. The argument was forcible, but the courts decided against them. Rudigier, bishop of Linz, was summoned to a criminal court for disturbing the public peace; he refused to appear, for by the concordat bishops were not subject to temporal jurisdiction; and when he was condemned to imprisonment the emperor at once telegraphed his full pardon. In the rural districts the clergy had much influence; they were supported by the peasants, and the Landtags of Tirol and Vorarlberg, where there was a clerical majority, refused to carry out the school law.

On the proclamation of papal infallibility in 1870, the Government took the opportunity of declaring that the concordat had lapsed, on the ground that there was a fundamental change in the character of the papacy. Nearly all the Austrian prelates had been opposed to the new doctrine; many of them remained to the end of the council and voted against it, and they only declared their submission with great reluctance. The New-Catholic movement, however, never made much progress in Austria. Laws regulating the position of the Church were carried in 1874. (For the concordat see LAVELEYE, *La Prusse et l'Autriche*, Paris, 1870.)

During 1868 the constitution then was open to attack on two sides, for the nationalist movement was gaining ground in Bohemia and Galicia. In Galicia the extreme party, headed by Smolka, had always desired to imitate the Czechs and not attend at Vienna; they were outvoted,

but all parties agreed on a declaration in which the final demands of the Poles were drawn up;¹ they asked that the powers of the Galician Landtag should be much increased, and that the members from Galicia should cease to attend the Reichsrath on the discussion of those matters with which the Galician Landtag should be qualified to deal. If these demands were not granted they would leave the Reichsrath. In Bohemia the Czechs were very active; while the Poles were parading their hostility to Russia in such a manner as to cause the emperor to avoid visiting Galicia, some of the Czech leaders attended a Slavonic demonstration at Moscow, and in 1868 they drew up and presented to the Diet at Prague a "declaration" which has since been regarded as the official statement of their claims. They asked for the full restoration of the Bohemian kingdom; they contended that no foreign assembly was qualified to impose taxes in Bohemia; that the Landtag was not qualified to elect representatives to go to Vienna, and that a separate settlement must be made with Bohemia similar to that with Hungary. This declaration was signed by eighty-one members, including many of the feudal nobles and bishops.² The German majority declared that they had forfeited their seats, and ordered new elections. The agitation spread over the country, serious riots took place, and with a view to keeping order the Government decreed exceptional laws. Similar events happened in Moravia, and in Dalmatia the revolt broke out among the Bocchese.

Before the combination of Clericals and Federalists the ministry broke down; they were divided among themselves; Counts Taaffe and Potocki wished to conciliate the Slavonic races—a policy recommended by Beust, probably with the sympathy of the emperor; the others determined to cripple the opposition by taking away the elections for the Reichsrath from the Landtags. Taaffe and his friends resigned, but the majority did not long survive. In March 1870, after long delay, the new Galician demands were definitely rejected; the whole of the Polish club, followed by the Tirolese and Slovenians, left the House, which consequently consisted of 110 members—the Germans and German representatives from Bohemia and Moravia. It was clearly impossible to govern with such a parliament. Not four years had gone by, and the new constitution seemed to have failed like the old one. The only thing to do was to attempt a reconciliation with the Slavs. The ministry resigned, and Potocki and Taaffe formed a Government with this object. Potocki then entered on negotiations, hoping to persuade the Czechs to accept the constitution. Rieger and Thun were summoned to Vienna; he himself went to Prague, but after two days he had to give up the attempt in despair. Feudals and Czechs all supported the declaration of 1868, and would accept no compromise, and he returned to Vienna after what was the greatest disappointment of his life. Government, however, had to be carried on; the war between Germany and France broke out in July, and Austria might be drawn into it; the emperor could not at such a crisis alienate either the Germans or the Slavs. The Reichsrath and all the Landtags were dissolved. This time in Bohemia the Czechs, supported by the Feudals and the Clericals, gained a large majority; they took their seats in the Landtag only to declare that they did not regard it as the legal representative of the Bohemian kingdom, but merely an informal assembly, and refused to elect delegates for the Reichsrath. The Germans in their turn now left the Diet, and the Czechs voted an address

to the Crown, drawn up by Count Thun, demanding the restoration of the Bohemian kingdom. When the Reichsrath met there were present only 130 out of 203 members, for the whole Bohemian contingent was absent; the Government then, under a law of 1868, ordered that as the Bohemian Diet had sent no delegates, they were to be chosen directly from the people. Twenty-four Constitutionalists and thirty *Declaranten* were chosen; the latter, of course, did not go to Vienna, but the additional twenty-four made a working majority by which the Government was carried on for the rest of the year.

But Potocki's influence was gone, and as soon as the European crisis was over, in February 1871, the emperor appointed a ministry chosen not from the Liberals but from the Federalists and Clericals, led by Count Hohenwart and Schäffle, a German professor chiefly known for his writings on political economy. They attempted to solve the problem by granting to the Federalists all their demands. So long as parliament was sitting they were kept in check; as soon as it had voted supplies and the Delegations had separated, they ordered new elections in all those Landtags where there was a Liberal majority. By the help of the Clericals they won enough seats to put the Liberals in a minority in the Reichsrath, and it would be possible to revise the constitution if the Czechs consented to come. They would only attend, however, on their own terms, which were a complete recognition by the Government of the claims made in the Declaration. This was agreed to; and on the 12th September, at the opening of the Landtag, the Governor read a royal message recognizing the separate existence of the Bohemian kingdom, and promising that the emperor should be crowned. It was received with delight throughout Bohemia; and the Czechs drew a draft constitution of fundamental rights. On this the Germans, now that they were in a minority, left the Landtag, and began preparations for resistance. In Upper Austria, Moravia, and Carinthia, where they were outvoted by the Clericals, they seceded, and the whole work of 1867 was on the point of being overthrown. Were the movement not stopped the constitution would be superseded, and the union with Hungary endangered. Beust and Andrassy warned the emperor of the danger, and the crown prince of Saxony was summoned by Beust to remonstrate with him. A great council was called at Vienna (Oct. 20), at which the emperor gave his decision that the Bohemian demands could not be accepted. The Czechs must come to Vienna, and consider a revision of the constitution in a constitutional manner. Hohenwart resigned, but at the same time Beust was dismissed, and a new Cabinet was chosen once more from among the German Liberals, under the leadership of Prince Anton Auersperg, whose brother Carlos had been one of the chief members in the Burger Ministerium. For the second time in four years the policy of the Government had completely changed within a few months. On 12th September the decree had been published accepting the Bohemian claims; before the end of the year copies of it were seized by the police, and men were thrown into prison for circulating it.

Auersperg's ministry held office for eight years. They began, as had the Burger Ministerium, with a vigorous Liberal centralizing policy. In Bohemia they succeeded at first in almost crushing the opposition. In 1872 the Landtag was dissolved; and the whole influence of the Government was used to procure a German majority. Koller, the governor, acted with great vigour. Opposition newspapers were suppressed; cases in which Czechish journalists were concerned were transferred to the German districts, so that they were tried by a

hostile German jury. Czechish manifestoes were confiscated, and meetings stopped at the slightest appearance of disorder; and the riots were punished by quartering soldiers upon the inhabitants. The decision between the two races turned on the vote of the feudal proprietors, and in order to win this a society was formed among the German capitalists of Vienna (to which the name of *Chabrus* was popularly given) to acquire by real or fictitious purchase portions of those estates to which a vote was attached. These measures were successful; a large German majority was secured; Jews from Vienna sat in the place of the Thuns and the Schwarzenbergs; and as for many years the Czechs refused to sit in the Landtag, the Government could be carried on without difficulty. A still greater blow to the Federalists was the passing of a new electoral law in 1873. The measure transferred the right of electing members of the Reichsrath from the Landtags to the direct vote of the people, the result being to deprive the Federalists of their chief weapon; it was no longer possible to take a formal vote of the legal representatives in any territory refusing to appoint deputies, and if a Czechish or Slovenian member did not take his seat the only result was that a single constituency was unrepresented, and the opposition weakened. The measure was strongly opposed. A petition with 250,000 names was presented from Bohemia; and the Poles withdrew from the Reichstag when the law was introduced. But enough members remained to give the legal quorum, and it was carried by 120 to 2 votes. At the same time the number of members was increased to 353, but the proportion of representatives from the different territories was maintained and the system of election was not altered. The proportion of members assigned to the towns was increased, the special representatives of the Chambers of Commerce and of the landed proprietors were retained, and the suffrage was not extended. The artificial system which gave to the Germans a parliamentary majority continued.

At this time the Czechs were much weakened by quarrels among themselves. A new party had arisen, calling themselves the *Freisinnige* or Radicals, but generally known as the Young Czechs. They disliked the alliance with the aristocracy and the clergy; they wished for universal suffrage, and recalled the Hussite traditions. They desired to take their seats in the Landtag, and to join with the Germans in political reform. They violently attacked Rieger, the leader of the Old Czechs, who maintained the alliance with the Feudalists and the policy of passive opposition. Twenty-seven members of the Landtag, led by Gregor and Stadkowsky, being outvoted in the Czechish Club, resigned their seats. They were completely defeated in the elections which followed, but for the next four years the two parties among the Czechs were as much occupied in opposing one another as in opposing the Germans. These events might have secured the predominance of the Liberals for many years. The election after the Reform Bill gave them an increased majority in the Reichsrath. Forty-two Czechs who had won seats did not attend; forty-three Poles stood aloof from all party combination, giving their votes on each occasion as the interest of their country seemed to require; the real opposition was limited to forty Clericals and representatives of the other Slavonic races, who were collected on the Right under the leadership of Hohenwart. Against them were 227 Constitutionalists, and it seemed to matter little that they were divided into three groups; there were 105 in the Liberal Club under the leadership of Herbst, 57 Constitutionalists, elected by the landed proprietors, and a third body of Radicals, some of whom were more democratic than the old Constitutional party, while others laid more stress

on nationality. They used their majority to carry a number of important laws regulating ecclesiastical affairs. Yet within four years the Government was obliged to turn for support to the Federalists and Clericals, and the rule of the German Liberals was overthrown. Their influence was indirectly affected by the great commercial crisis of 1873. For some years there had been active speculation on the Stock Exchange; a great number of companies, chiefly banks and building societies, had been founded on a very insecure basis. The inevitable crisis began in 1872; it was postponed for a short time, and there was some hope that the Exhibition, fixed for 1873, would bring fresh prosperity; the hope was not, however, fulfilled, and the final crash, which occurred in May, brought with it the collapse of hundreds of undertakings. The loss fell almost entirely on those who had attempted to increase their wealth by speculative investment. Sound industrial concerns were little touched by it, but speculation had become so general that every class of society was affected, and in the investigation which followed it became apparent that some of the most distinguished members of the governing Liberal party, including at least two members of the Government, were among those who had profited by the unsound finance. It appeared also that many of the leading newspapers of Vienna, by which the Liberal party was supported, had received money from financiers. For the next two years political interest was transferred from Parliament to the law courts, in which financial scandals were exposed, and the reputations of some of the leading politicians were destroyed.¹

This was to bring about a reaction against the economic doctrines which had held the field for nearly twenty years; but the full effect of the change was not seen for some time. What ruined the Government was the want of unity in the party, and their neglect to support a ministry which had been taken from their own ranks. In a country like Austria, in which a mistaken foreign policy or a serious quarrel with Hungary might bring about the disruption of the monarchy, parliamentary government was impossible unless the party which the Government helped in internal matters were prepared to support it in foreign affairs and in the commercial policy bound up with the settlement with Hungary. This the Constitutional parties did not do. During discussions on the Ausgleich in 1877 a large number voted against the duties on coffee and petroleum, which were an essential part of the agreement; they demanded, moreover, that the treaty of Berlin should be laid before the House, and 112 members, led by Herbst, gave a vote hostile to some of its provisions, and in the Delegation refused the supplies necessary for the occupation of Bosnia. They doubtless were acting in accordance with their principles, but the situation was such that it would have been impossible to carry out their wishes; the only result was that the Austrian ministers and Andrassy had to turn for help to the Poles, who began to acquire the position of a Government party, which they have kept since then. At the beginning of 1879 Auersperg's resignation, which had long been offered, was accepted. The Constitutionalists remained in power; but in the reconstructed Cabinet, though Stromeyer was president, Count Taaffe, as minister of the interior, was the most important member.

Parliament was dissolved in the summer, and Taaffe, by private negotiations, first of all persuaded the Bohemian feudal proprietors to give the Feudalists, who had long

been excluded, a certain number of seats; secondly, he succeeded where Potocki had failed, and came to an agreement with the Czechs; they had already, in 1878, taken their seats in the Diet at Prague, and now gave up the policy of "passive resistance," and consented to take their seats also in the parliament at Vienna.

On entering the House they took the oath without reservation, but in the speech from the throne the emperor himself stated that they had entered without prejudice to their convictions, and on the first day of the session Rieger read a formal reservation of right. The Liberals had also lost many seats, so that the House now had a completely different aspect; the Constitutionals were reduced to 91 Liberals and 54 Radicals; but the Right, under Hohenwart, had increased to 57, and there were 57 Poles and 54 Czechs. A combination of these three parties might govern against the Constitutionals. Taaffe, who now became first minister, tried first of all to govern by the help of the Moderates of all parties, and he included representatives of nearly every party in his Cabinet. But the Liberals again voted against the Government on an important military bill, an offence almost as unpardonable in Austria as in Germany, and a great meeting of the party decided that they would not support the Government. Taaffe, therefore, was obliged to turn for support to the Right. The German members of the Government resigned, their place was taken by Clericals, Poles, and Czechs, Smolka was elected president of the Reichsrath, and the German Liberals found themselves in a minority opposed by the "iron ring" of these three parties, and helpless in the parliament of their own creation. For fourteen years Taaffe succeeded in maintaining the position he had thus secured. He was not himself a party man; he had sat in a Liberal Government; he had never assented to the principles of the Federalists, nor was he an adherent of the Clerical party. He continued to rule according to the constitution; his watchword was "unpolitical politics," and he brought in little contentious legislation. The great source of his strength was that he stood between the Right and a Liberal Government. There was a large minority of Constitutionals; they might easily become a majority, and the Right were therefore obliged to support Taaffe in order to avert this. They continued to support him, even if they did not get from him all that they could have wished, and the Czechs acquiesced in a foreign policy with which they had little sympathy. Something, however, had to be done for them, and from time to time concessions had to be made to the Clericals and the Federalists.

The real desire of the Clericals was an alteration of the school law, by which the control of the schools should be restored to the Church and the period of compulsory education reduced. In this, however, the Government did not meet them, and in 1882 the Clericals, under Prince Alfred v. Liechtenstein, separated from Hohenwart's party and founded their own club, so that they could act more freely. Both the new Clerical Club and the remainder of the Conservatives were much affected by the reaction against the doctrines of economic Liberalism. They began to adopt the principles of Christian Socialism expounded by Rudolf Mayer and Baron von Vogelfang, and the economic revolt against the influence of capital was with them joined to a half-religious attack upon the Jews. They represented that Austria was being governed by a close ring of political financiers, many of whom were Jews or in the pay of the Jews, who used the forms of the constitution, under which there was no representation of the working classes, to exploit the labour of the poor at the same time that they ruined the people

by alienating them from Christianity in "godless schools." It was during these years that the foundation for the democratic clericalism of the future was laid. The chief political leader in this new tendency was Prince Aloys v. Liechtenstein, who complained of the political influence exercised by the chambers of commerce, and demanded the organization of working men in guilds. It was by their influence that a law was introduced limiting the rate of interest, and they co-operated with the Government in legislation for improving the material condition of the people, which had been neglected during the period of Liberal government, and which was partly similar to the laws introduced at the same time in Germany.

There seems no doubt that the condition of the workmen in the factories of Moravia and the oil-mines of Galicia was peculiarly unfortunate; the hours of work were very long, the conditions were very injurious to health, and there were no precautions against accidents. The report of a parliamentary inquiry, called for by the Christian Socialists, showed the necessity for interference. In 1883 a law was carried, introducing factory inspection, extending to mines and all industrial undertakings. The measure seems to have been successful, and there is a general agreement that the inspectors have done their work with skill and courage. In 1884 and 1885 important laws were passed regulating the work in mines and factories, and introducing a maximum working day of eleven hours in factories, and ten hours in mines. Sunday labour was forbidden, and the hours during which women and children could be employed were limited. Great power was given to the administrative authorities to relax the application of these laws in special cases and special trades. This power was at first freely used, but it was closely restricted by a further law of 1893. In 1887-88 laws, modelled on the new German laws, introduced compulsory insurance against accidents and sickness. These measures, though severely criticized by the Opposition, were introduced to remedy obvious, and in some cases terrible social evils. Other laws to restore guilds among working men had a more direct political object. Another form of State Socialism was the acquisition of railways by the state. Originally railways had been built by private enterprise, supported in some cases by a state guarantee; a law of 1877 permitted the acquisition of private lines; when Taaffe retired the state possessed nearly 5000 miles of railway, not including these which belonged to Austria and Hungary conjointly. In 1899 a minister of railways was appointed. In this policy military considerations as well as economic were of influence. In every department we find the same reaction against the doctrines of *laissez-faire*. In 1889 for the first time the Austrian budget showed a surplus, partly the result of the new import duties, partly due to a reform of taxation.

For a fuller description of these social reforms, see the *Jahrbuch für Gesetzgebung*, Leipzig, 1886, 1888, and 1894; also the annual summary of new laws in the *Zeitschrift für Staatswissenschaft*, Stuttgart. For the Christian Socialists, see NITTI, *Catholic Socialism*, London, 1895.

Meanwhile it was necessary for the Government to do something for the Czechs and the other Slavs, on whose support they depended for their majority. The influence of the Government became more favourable to them in the matter of language, and this caused the struggle of nationalities to assume the first place in Austrian public life—a place which it has ever since maintained. The question of language becomes a political one, so far as it concerns the use of different languages in the public offices and law courts, and in the schools. There never was any

question.*

general law laying down clear and universal rules, but since the time of Joseph II. German had been the ordinary language of the Government. All laws were published in German; German was the sole language used in the central public offices in Vienna, and the language of the court and of the army; moreover, in almost every part of the monarchy it had become the language of what is called the *internal service* in the public offices and law courts; all books and correspondence were kept in German, not only in the German districts, but also in countries such as Bohemia and Galicia. The bureaucracy and the law courts had therefore become a network of German-speaking officialism extending over the whole country; no one had any share in the Government unless he could speak and write German. The only exception was in the Italian districts; not only in Italy itself (in Lombardy, and afterwards in Venetia), but in South Tirol, Trieste, Istria, and Dalmatia, Italian has always been used, even for the internal service of the Government offices, and it remains to this day the language of the Austrian navy. Any interference with the use of German would be a serious blow to the cause of those who hoped to Germanize the whole empire. Since 1867 the old rules have been maintained absolutely as regards the army, and German has also, as required by the military authorities, become the language of the railway administration. It remains the language of the central offices in Vienna, and is the usual, though not the only, language used in the Reichsrath. In 1869 a great innovation was made, when Polish was introduced throughout the whole of Galicia as the normal language of Government; and since that time the use of German has almost entirely disappeared in that territory. Similar innovations have also begun, as we shall see, in other parts.

Different from this is what is called the *external service*. Even in the old days it was customary to use the language of the district in communication between the Government offices and private individuals, and evidence could be given in the law courts in the language generally spoken. This was not the result of any law, but depended on administrative regulations of the Government service; it was practically necessary in remote districts, such as Galicia and Bukovina, where few of the population understood German. In some places a Slavonic-speaking individual would himself have to provide the interpreter, and approach the Government in German. Local authorities, *e.g.*, town councils and the Diets, were free to use what language they wished, and in this matter the Austrian Government has shown great liberality. The constitution of 1867 laid down a principle of much importance, by which previous custom became established as a right. Article 19 runs: "All races of the empire have equal rights, and every race has an inviolable right to the preservation and use of its own nationality and language. The equality of all customary (*landesüblich*) languages in school, office, and public life, is recognized by the state. In those territories in which several races dwell, the public and educational institutions are to be so arranged that, without applying compulsion to learn a second *Landessprache*, each of the races receives the necessary means of education in its own language." The application of this law gives great power to the Government, for everything depends on what is meant by *landesüblich*, and it rests with them to determine when a language is customary. The Germans demand the recognition of German as a customary language in every part of the empire, so that a German may claim to have his business attended to in his own language, even in Dalmatia and Galicia. In Bohemia the Czechs claim that their language shall be recognized as customary, even in those districts such as Reichenberg, which are almost completely

German; the Germans, on the other hand, claim that Czechish shall only be recognized in those towns and districts where there is a considerable Czech population. What Taaffe's Administration did was to interpret this law in a sense more favourable to the Slavs than had hitherto been the case.

Peculiar importance is attached to the question of education. The law of 1867 required that the education in the elementary schools in the Slavonic districts should be given in Czech, or Slovenian, as the case might be. The Slavs, however, required that, even when a small minority of Slavonic race settled in any town, they should not be compelled to go to the German schools, but should have their own school provided for them; and this demand was granted by Prazak, minister of education under Count Taaffe. The Germans had always hoped that the people as they became educated would cease to use their own particular language. Owing to economic causes the Slavonic races, who increase more rapidly than the Germans, tend to move westwards, and large numbers settle in the towns and manufacturing districts. It might have been expected that they would then cease to use their own language and become Germanized; but, on the contrary, the movement of population is spreading their language, and they claim that special schools shall be provided for them, and that men of their own nationality should be appointed to Government offices to deal with their business. This has happened not only in many places in Bohemia, but in Styria, and even in Vienna, where there has been a great increase in the Czechish population and a Czechish school has been founded. The introduction of Slavonic into the middle and higher schools has affected the Germans in their most sensitive point. They have always insisted that German is the *Kultur-sprache*. On one occasion Count A. Auersperg (Anastasius Grün) entered the Landtag of Carniola carrying the whole of the Slovenian literature under his arm, as evidence that the Slovenian language could not well be substituted for German as a medium of higher education.

The first important regulations which were issued under the law of 1867 applied to Dalmatia, and for that country between 1872 and 1876 a series of laws and edicts were issued determining to what extent the Slavonic idioms were to be recognized. Hitherto all business had been done in Italian, the language of a small minority living in the seaport towns. The effect of these laws has been to raise Croatian to equality with Italian. It has been introduced in all schools, so that nearly all education is given in Croatian, even though a knowledge of Italian is quite essential for the maritime population; and it is only in one or two towns, such as Zara, the ancient capital of the country, that Italian is able to maintain itself. Since 1882 there has been a Slavonic majority in the Diet, and Italian has been disused in the proceedings of that body. In this case the concessions to the Servo-Croatians had been made by the Liberal ministry; they required the parliamentary support of the Dalmatian representatives, who were more numerous than the Italian, and it was also necessary to cultivate the loyalty of the Slavonic races in this part so as to gain a support for Austria against the Russian party, which was very active in the Balkan Peninsula. It was better to sacrifice the Italians of Dalmatia than the Germans of Carinthia.¹

It was not till 1879 that the Slovenians received the support of the Government. In Carniola they succeeded, in 1882, in winning a majority in the Diet, and from this time while the Diet of Styria is the centre of the German, that of Carniola is the chief support of the Slovenian

¹ For Dalmatia, see T. G. Jackson, *Dalmatia, &c.* Oxford, 1889.

agitation. In the same year they won the majority in the town council of Laibach, which had hitherto been German. They were able, therefore, to introduce Illyrian as the official language, and cause the names of the streets to be written up in Illyrian. This question of street names is, as it were, a sign of victory. Serious riots broke out in some of the towns of Istria when, for the first time, Illyrian was used for this purpose as well as Italian. In Prague the victory of the Czechs has been marked by the removal of all German street names, and the Czechish town council even passed a bye-law forbidding private individuals to have tablets put up with the name of the street in German. In consequence of a motion by the Slovenian members of the Reichsrath and a resolution of the Diet of Carniola, the Government also declared Slovenian to be a recognized language for the whole of Carniola, for the district of Cilli in Styria, and for the Slovenian and mixed districts in the south of Carinthia, and determined that in Laibach a Slovenian gymnasium should be maintained as well as the German one.

The Germans complain that in many cases the Government acted very unfairly to them. They constantly refer to the case of Klagenfurt. This town in Carinthia had a population of 16,491 German-speaking Austrians; the Slovenian-speaking population numbered 568, of whom 180 were inhabitants of the gaol or the hospital. The Government, however, in 1880 declared Slovenian a customary language, so that provision had to be made in public offices and law courts for dealing with business in Slovenian. It must be remembered, however, that even though the town was German, the rural population of the surrounding villages was chiefly Slovenian.

It was in Bohemia and Moravia that the contest was fought out with the greatest vehemence. The two races were nearly equal, and the victory of Czechish would mean that nearly two million Germans would be placed in a position of subordination; but for the last twenty years there had been a constant encroachment by Czechish on German. This was partly due to the direct action of the Government. An ordinance of 1880 determined that henceforward all business which had been brought before any government office or law court should be dealt with, within the office, in the language in which it was introduced; this applied to the whole of Bohemia and Moravia, and meant that Czechish would henceforward have a position within the Government service. It was another step in the same direction when, in 1886, it was ordered that "to avoid frequent translations" business introduced in Czechish should be dealt with in the same language in the high courts of Prague and Brunn. Then not only were a large number of Czechish elementary schools founded, but also many middle schools were given to the Czechs, and Czechish classes introduced in German schools; and, what affected the Germans most, in 1882 classes in Czechish were started in the university of Prague—a desecration, as it seemed, of the oldest German university.

The growth of the Slavonic races was, however, not merely the result of Government assistance; it had begun long before Taaffe assumed office; it was to be seen in the census returns and in the results of elections. Prague was no longer the German city it had been fifty years before; the census of 1880 showed 36,000 Germans to 120,000 Czechs. It was the same in Pilsen. In 1861 the Germans had a majority in this town; in 1880 they were not a quarter of the population. This same phenomenon, which occurs elsewhere, cannot be attributed to any laxity of the Germans. The generation which was so vigorously demanding national rights had themselves all been brought up under the old system in German schools, but this had not implanted in them a desire to become German. It was partly due to economic causes—the greater increase

among the Czechs, and the greater migration from the country to the towns; partly the result of the romantic and nationalist movement which had arisen about 1830, and partly the result of establishing popular education and parliamentary government at the same time. As soon as these races which had so long been ruled by the Germans received political liberty and the means of education, they naturally used both to reassert their national individuality.

It may be suggested that the resistance to the German language is to some extent a result of the increased national feeling among the Germans themselves. They have made it a matter of principle. In the old days it was common for the children of German parents in Bohemia to learn Czechish; since 1867 this has ceased to be the case. It may almost be said that they make it a point of honour not to do so. A result of this is that, as educated Czechs are generally bilingual, it is easier for them to obtain appointments in districts where a knowledge of Czechish is required, and the Germans therefore regard every order requiring the use of Czechish as an order which excludes Germans from a certain number of posts. This attitude of hostility and contempt is strongest among the educated middle class; it is not shown to the same extent by the clergy and the nobles.

The influence of the Church is also favourable to the Slavonic races, not so much from principle as owing to the fact that they supply more candidates for ordination than the Germans. There is no doubt, however, that the tendency among Germans has been to exalt the principle of nationality above religion, and to give it an absolute authority in which the Roman Catholic Church cannot acquiesce. In this, as in other ways, the Germans in Austria have been much influenced by the course of events in the German empire. This hostility of the Church to the German nationalist movement led in 1898 to an agitation against the Roman Catholic Church, and among the Germans of Styria and other territories large numbers left the Church, going over either to Protestantism or to Old Catholicism. This "Los von Rom" movement, which was caused by the continued alliance of the Clerical party with the Slavonic parties, is more of the nature of a political demonstration than of a religious movement.

[There is a very extensive literature on the question of languages and nationality in Austria. The best statement of the legal question will be found in ULBRICH and MISCHLER, *Oesterreichisches Staats-Wörterbuch*. See also DUMREICHER, *Südostdeutsche Betrachtungen*. Leipzig, 1893.—HAINISCH, *Die Zukunft der Deutsch-Oesterreicher*. Vienna, 1892.—HERKNER, *Die Zukunft der Deutsch-Oesterreicher*. Vienna, 1893.—SCHLESINGER, *Die Nationalitäts-Verhältnisse Böhmens*. The Germans, so long accustomed to rule, now saw their old ascendancy threatened, and they defended it with an energy that increased with each defeat.

In 1880 they founded a great society, the *German Deutscher Schul-Verein*, to establish and assist German schools. It spread over the whole of the empire; in a few years it numbered 100,000 members, and had an income of nearly 300,000 gulden; no private society in Austria had ever attained so great a success. In the Reichsrath a motion was introduced, supported by all the German Liberal parties, demanding that German should be declared the language of state and regulating the conditions under which the other idioms could be recognized; it was referred to a committee from which it never emerged, and a bill to the same effect, introduced in 1886, met a similar fate. In Bohemia they demanded, as a means of protecting themselves against the effect of the language ordinances, that the country should be divided into two parts; in one German was to be the sole language, in the other Czech was to be recognized. A proposal to this effect was introduced by them in the Landtag at the end of 1886, but since 1882 the Germans had been in a minority. The Czechs, of course, refused even to consider it; it would have cut away the ground on which their whole policy was built up, namely, the indissoluble unity of the Bohemian kingdom, in which German and Czech should throughout be recognized as equal and parallel

German hostility.

languages. It was rejected on a motion of Prince Karl Schwarzenberg without discussion, and on this all the Germans rose and left the Landtag, thereby imitating the action of the Czechs in old days when they had the majority.

These events produced a great change on the character of the German opposition. It became more and more

avowedly racial; the defence of German nationality was put in the front of their programme.

New German parties. The growing national animosity added bitterness to political life, and destroyed the possibility of a strong homogeneous party on which a government might depend. The beginning of this movement can be traced back to the year 1870. About that time a party of young Germans had arisen who professed to care little for constitutionalism and other "legal mummies," but made the preservation and extension of their own nationality their sole object. As is so often the case in Austria, the movement began in the university of Vienna, where a *Lese-Verein* of German students was formed as a point of cohesion for Germans, which had eventually to be suppressed. The first representative of the movement in parliament was Herr von Schoenerer, who did not scruple to declare that the Germans looked forward to union with the German empire. They were strongly influenced by men outside Austria. Bismarck was their national hero, the anniversary of Sedan their political festival, and approximation to Germany was dearer to them than the maintenance of Austria. After 1878 a heightening of national feeling began among the Radicals, and in 1881 all the German parties in opposition joined together in a club called the *United Left*, and in their programme put in a prominent place the defence of the position of the Germans as the condition for the existence of the state, and demanded that German should be expressly recognized as the official language. The younger and more ardent spirits, however, found it difficult to work in harmony with the older constitutional leaders. They complained that the party leaders were not sufficiently decisive in the measures for self-defence. In 1885 great festivities in honour of Bismarck's eightieth birthday, which had been arranged in Gratz, were forbidden by the Government, and the Germans of Styria were very indignant that the party did not take up the matter with sufficient energy. After the elections of 1885 the Left therefore broke up again into two clubs, the *German Austrian*, which included the more moderate, and the *German*, which wished to use sharper language. The German Club, e.g., congratulated Bismarck on his measures against the Poles; the German Austrians refused to take cognizance of events outside Austria with which they had nothing to do. Even the German Club was not sufficiently decided for Herr von Schoenerer and his friends, who broke off from it and founded a *National German Union*. They spoke much of *Germanenthum* and "Unverfälschtes Deutschthum," and they advocated a political union with the German empire, and were strongly anti-Hungarian and wished to resign all control over Galicia, if by a closer union with Germany they could secure German supremacy in Bohemia and the south Slavonian countries. They play the same part in Austria as does the "pan-Germanic Union" in Germany. When in 1888 the two clubs, the German Austrians and the Germans, joined once more under the name of the *United German Left* into a new club with eighty-seven members, so as the better to guard against the common danger and to defeat the educational demands of the Clericals, the National Germans remained apart with seventeen members. They were also infected by the growing spirit of anti-Semitism. The German parties had originally been the party of the capitalists, and comprised

a large number of Jews; this new German party committed itself to violent attacks upon the Jews, and for this reason alone any real harmony between the different branches would have been impossible.

Notwithstanding the concessions about language the Czechs had, however, made no advance towards their real object—the recognition of the Bohemian kingdom. Perhaps the leaders of the party, who were now growing old, would have been content with the influence they had already attained, but they were hard pressed at home by the Young Czechs, who were more impatient. When Count Thun was appointed governor of Bohemia their hopes ran high, for he was supposed to favour the coronation of the emperor at Prague. In 1890, however, instead of proceeding to the coronation as was expected, Taaffe attempted to bring about a reconciliation between the opposing parties. The influence by which his policy was directed is not quite clear, but the Czechs had been of recent years less easy to deal with, and Taaffe had never really shown any wish to alter the constitution; his policy always was to destroy the influence of parliament by playing off one party against the other, and so to win a clear field for the Government. During the month of January conferences were held at Vienna, with Taaffe in the chair, to which were invited representatives of the three groups into which the Bohemian representatives were divided, the German party, the Czechs, and the Feudal party. After a fortnight's discussion an agreement was made on the basis of a separation between the German and the Czechish districts, and a revision of the electoral law. A protocol enumerating the points agreed on was signed by all who had taken part in the conference, and in May Bills were laid before the Landtag incorporating the chief points in the agreement. But they were not carried; the chief reason being that the Young Czechs had not been asked to take part in the conference, and did not consider themselves bound by its decisions; they opposed the measures and had recourse to obstruction, and a certain number of the Old Czechs gradually came over to them. Their chief ground of criticizing the proposed measures was that they would threaten the unity of the Bohemian country.¹ At the elections in 1891 a great struggle took place between the Old and the Young Czechs. The latter were completely victorious; Rieger, who had led the party for thirty years, disappeared from the Reichsrath. The first result was that the proposed Ausgleich with Bohemia came to an end. But the disappearance of the Old Czechs made the parliamentary situation very insecure. The Young Czechs could not take their place; their Radical and anti-Clerical tendencies alarmed the Feudalists and Clericalists who formed so large a part of the Right; they attacked the alliance with Germany; they made public demonstration of their French sympathies; they entered into communication with other Slavonic races, especially the Serbs of Hungary and Bosnia; they demanded universal suffrage, and occasionally supported the German Radicals in their opposition to the Clerical parties, especially in educational matters; under their influence disorder increased in Bohemia, a secret society called the *Umladina* (in imitation of the Servian society of that name) was discovered, and stringent measures had to be taken to preserve order. The Government therefore veered round towards the German Liberals; some of the ministers most obnoxious to the Germans resigned, and their places were taken by Germans. For two years the Government seemed to waver, looking now to the Left,

The Ausgleich with Bohemia.

¹ On this see Menger, *Der Ausgleich mit Böhmen*, Vienna, 1891, where the documents are printed.

now to Hohenwart and his friends; for a time Taaffe really had the support of all parties except the Young Czechs.

After two years he gave up his cautious policy and took a bold move. In October 1893 he introduced a Reform Bill. Universal suffrage had long been demanded by the working men and the

Electoral reform.

Socialists; the Young Czechs also had put it on their programme, and many of the Christian Socialists and anti-Semites desired an alteration of the franchise. Taaffe's Bill, while keeping the *Curiae* of the feudal proprietors and the chambers of commerce as they were, and making no change in the number of members, proposed to give the franchise in both towns and rural districts to every one who could read and write, and had resided six months in one place. This was opposed by the Liberals, for with the growth of Socialism and anti-Semitism, they knew that the extension of the franchise would destroy their influence. On this Taaffe had probably calculated, but he had omitted to inquire what the other parties would do. He had not even consulted Hohenwart, to whose assistance he owed his long tenure of power. Not even the pleasure of ruining the Liberals was sufficient to persuade the Conservatives to vote for a measure which would transfer the power from the well-to-do to the indigent, and Hohenwart justly complained that they ought to have been secure against surprises of this kind. The Poles also were against a measure which would give more influence to the Ruthenians. The position of the Government was hopeless, and without waiting for a division Taaffe resigned.

The event to which for fourteen years the Left had looked forward had now happened. Once more they could have a share in the Government, which they always believed belonged to them by nature. Taught by experience and adversity, they did not scruple to enter into an alliance with their old enemies, and a coalition ministry was formed from the Left, the Clericals, and the Poles. The president was Prince Alfred Windisch-Grätz, grandson of the celebrated general, one of Hohenwart's ablest lieutenants; Hohenwart himself did not take office. Of course an administration of this kind could not take a definite line on any controversial question, but during 1894 they carried through the commercial treaty with Russia and the laws for the continuance of the currency reform. The differences of the clubs appeared, however, in the discussions on reform; the Government, not strong enough to have a policy of its own, had referred the matter to a committee; for the question having once been raised, it was impossible not to go on with it. This would probably have been fatal to the coalition, but the final blow was given by a matter of very small importance arising from the disputes on nationality. The Slovenians had asked that in the gymnasium at Cilli classes in which instruction was given in Slovenian should be formed parallel to the German classes. This request caused great excitement in Styria and the neighbouring districts; the Styrian Diet (from which the Slovenian minority had seceded) protested. The Slovenians were, however, members of the Hohenwart Club, so Hohenwart and his followers supported the request, which was adopted by the ministry. The German Left opposed it; they were compelled to do so by the popular indignation in the German districts; and when the vote was carried against them (12th June 1895) they made it a question of confidence, and formally withdrew their support from the Government, which therefore at once resigned.

After a short interval the emperor appointed as minister-president Count Badeni, who had earned a great reputation

as governor of Galicia. He formed an administration the merit of which, as of so many others, was that it was to belong to no party and to have no programme. He hoped to be able to work in harmony with the moderate elements of the Left; his mission was to carry through the Ausgleich with Hungary; to this everything else must be subordinated. During 1896 he succeeded in carrying a Reform Bill, which satisfied nearly all parties. All the old categories of members were maintained, but a fifth *curia* was added, in which almost any one might vote who had resided six months in one place and was not in domestic service; in this way seventy-two would be added to the existing members. This matter having been settled, parliament was dissolved. The result of the elections of 1897 was the return of a House so constituted as to make any strong Government impossible. On both sides the anti-Semitic parties representing the extreme demagogic elements were present in considerable numbers. The United German Left had almost disappeared; it was represented only by a few members chosen by the great proprietors; in its place there were the three parties—the German Popular party, the German Nationalists, and the German Radicals—who all put questions of nationality first and had deserted the old standpoint of the constitution. Then there were the fourteen Social Democrats who had won their seats under the new franchise. The old party of the Right was however also broken up; side by side with forty-one Clericals there were twenty-eight Christian Socialists led by Dr Lueger, a man of great oratorical power, who had won a predominant influence in Vienna, so long the centre of Liberalism, and had quite eclipsed the more modest efforts of Prince Liechtenstein. As among the German National party, there were strong nationalist elements in his programme, but they were chiefly directed against Jews and Hungarians; Lueger had already distinguished himself by his violent attacks on Hungary, which had caused some embarrassment to the Government at a time when the negotiations for the Ausgleich were in progress. Like anti-Semites elsewhere, the Christian Socialists were reckless and irresponsible, appealing directly to the passions and prejudices of the most ignorant. There were altogether 200 German members of the Reichsrath, but they were divided into eight parties, and nowhere did there seem to be the elements on which a Government could be built up.

The Parliamentary situation is best explained by the following table showing the parties:—

The most remarkable result of the elections was the disappearance of the Liberals in Vienna. In 1879, out of 37 members returned in Lower Austria, 33 were Liberals. Now the Christian Socialists were first with 28, then the Socialists with 14, and the few remaining seats were divided between the Nationalists and the Radicals. It was impossible to maintain a strong party of moderate constitutionalists, on whom the Government could depend, unless there was a large nucleus from Lower Austria. The influence of Lueger was very embarrassing; he had now a majority of two-thirds in the town council, and had been elected burgomaster. The emperor had refused to confirm the election; he had been re-elected, and then the emperor, in a personal interview, appealed to him to withdraw. He consented to do so; but, after the election of 1897 had given him so many followers in the Reichsrath, Badeni advised that his election as burgomaster should be confirmed. There was violent antipathy between the Christian Socialists and the German Nationalists, and the transference of their quarrels from the Viennese Council Chamber to the Reichsrath was very detrimental to the orderly conduct of debate.

The limited suffrage had hitherto prevented Socialism from becoming a political force in Austria as it had in Germany, and the national divisions have always impeded the creation of a centralized Socialist party. The first object of the working classes necessarily was the attainment of political power; in 1867 there had been mass demonstrations and petitions to the Government for universal suffrage. During the next years there was the beginning of a real Socialist movement in Vienna and in Styria, where there is a considerable industrial population; after 1879, however, the growth of the party was interrupted by the introduction of anarchical doctrines. Most's paper, the *Freiheit*, was introduced through Switzerland, and had a large circulation. The anarchists, under the leadership of Peukert, seem to have attained considerable numbers. In 1883-84 there were a number of serious strikes, collisions between the police and the workmen, followed by assassinations; it was a peculiarity of Austrian anarchists that in some cases they united robbery to murder. The Government, which was seriously alarmed, introduced severe repressive measures; the leading anarchists were expelled or fled the country. In 1887, under the leadership of Dr Adler, the Socialist party began to revive (the party of violence having died away), and since then it has steadily gained in numbers; in the forefront of the political programme is put the demand for universal suffrage. In no country is the 1st of May, as the festival of Labour, celebrated so generally.

Badeni after the election sent in his resignation, but

the emperor refused to accept it, and he had therefore to do the best he could and turn for support to the other nationalities. The strongest of them were the fifty-nine Poles and sixty Young Czechs; he therefore attempted, as Taaffe had done, to come to some agreement with them. The Poles were always ready to support the Government; among the Young Czechs the more moderate had already attempted to restrain the wilder spirits of the party, and they were quite prepared to enter into negotiations. They did not wish to lose the opportunity which now was open to them of winning influence over the administration. What they required was further concession as to the language in Bohemia. In May 1897 Badeni therefore published his celebrated *ordinances*. They determined (1) that all correspondence and documents regarding *The* every matter brought before the Government *language* officials should be conducted in the language in *ordinances* which it was first introduced. This applied to *of 1897*. the whole of Bohemia, and meant the introduction of Czech into the government offices throughout the whole of the kingdom; (2) after 1903 no one was to be appointed to a post under the Government in Bohemia until he had passed an examination in Czech. These ordinances fulfilled the worst fears of the Germans. The German Nationalists and Radicals declared that no business should be done till they were repealed and Badeni dismissed. They resorted to obstruction. They brought in repeated motions to impeach the ministers, and parliament had to be prorogued in June, although no business of any kind had been transacted. Badeni had not anticipated the effect his ordinances would have; as a Pole he had little experience in the western part of the empire. During the recess he tried to open negotiations, but the Germans refused even to enter into a discussion until the ordinances had been withdrawn. The agitation spread throughout the country; great meetings were held at Eger and Aussig, which were attended by Germans from across the frontier, and led to serious disturbances; the cornflower, which had become the symbol of German nationality and union with Germany, was freely worn, and the language used was in many cases treasonable. The emperor insisted that the Reichsrath should again be summoned to pass the necessary measures for the Ausgleich; scenes then took place which have no parallel in parliamentary history. To meet the obstruction it was determined to sit at night, but this was unsuccessful. On one occasion Dr Lecher, one of the representatives of Moravia, spoke for twelve hours, from 9 P.M. till 9 A.M., against the Ausgleich. The opposition was not always limited to feats of endurance of this kind. On 3rd November there was a free fight in the House; it arose from a quarrel between Dr Lueger and the Christian Socialists on the one side (for the Christian Socialists had supported the Government since the confirmation of Lueger as burgomaster) and the German Nationalists under Dr Wolff, a German from Bohemia, the violence of whose language had already caused Badeni to challenge him to a duel. The Nationalists refused to allow Lueger to speak, clapping their desks, hissing, and making other noises, till at last the Young Czechs attempted to prevent the disorder by violence. On 24th November the scenes of disturbance were renewed. The president, Herr v. Abramovitch, an Armenian from Galicia, refused to call on Schoenerer to speak. The Nationalists therefore stormed the platform, and the president and ministers had to fly into their private rooms to escape personal violence, until the Czechs came to their rescue, and by superiority in numbers and physical strength severely punished Herr Wolff and his friends. The rules of the House giving the president no authority for maintaining order, he determined, with the assent of the ministers, to propose

alterations in procedure. The next day, when the sitting began, one of the ministers, Count Falkenhayn, a Clerical who was very unpopular, moved "That any member who continued to disturb a sitting after being twice called to order could be suspended—for three days by the president, and for thirty days by the House." The din and uproar was such that not a word could be heard, but at a pre-arranged signal from the president all the Right rose, and he then declared that the new order had been carried, although the procedure of the House required that it should be submitted to a committee. The next day, at the beginning of the sitting, the Socialists rushed on the platform, tore up and destroyed all the papers lying there, seized the president, and held him against the wall. After he had escaped eighty police were introduced into the House and carried out the fourteen Socialists. The next day Herr Wolff was treated in the same manner. The excitement spread to the street. Serious disorders took place in Vienna and in Gratz; the German opposition had the support of the people, and Lueger warned the ministers that as burgomaster he would be unable to maintain order in Vienna; even the Clerical Germans showed signs of deserting the Government. The emperor,

**Badeni
resigns.**

hastily summoned to Vienna, accepted Badeni's resignation, the Germans having thus by obstruction attained part of their wishes. The new minister, Gautsch, a man popular with all parties, held office for three months; he proclaimed the budget and the Ausgleich, and in February replaced the language ordinances by others, under which Bohemia was to be divided into three districts—one Czechish, one German, and one mixed. The Germans, however, were not satisfied with this; they demanded absolute repeal. The Czechs also were offended; they arranged riots at Prague; the professors in the university refused to lecture unless the German students were defended from violence; Gautsch resigned, and Thun, who had been governor of Bohemia, was appointed minister. Martial law was proclaimed in Bohemia, and strictly enforced. Thun then arranged with the Hungarian ministers a compromise about the Ausgleich.

The Reichsrath was again summoned, and the meetings were less disturbed than in the former year, but the Germans still prevented any business from being done. The Germans now had a new cause of complaint. Paragraph

**Renewed
conflict
between
Germans
and
Czechs.**

14 of the law of 1867 provided that, in cases of pressing necessity, orders for which the assent of the Reichsrath was required might, if the Reichsrath were not in session, be proclaimed by the emperor; they had to be signed by the whole ministry, and if they were not laid before the Reichsrath within four months of its meeting, or if they did not receive the approval of both Houses, they ceased to be valid. The Germans contended that the application of this clause to the Ausgleich was invalid, and demanded that it should be repealed. Thun had in consequence to retire, in September 1899. His successor, Count Clary, began by withdrawing the ordinances which had been the cause of so much trouble, but it was now too late to restore peace. The Germans were not sufficiently strong and united to keep in power a minister who had brought them the relief for which they had been clamouring for two years. The Czechs, of course, went into opposition, and used obstruction. The extreme German party, however, took the occasion to demand that paragraph 14 should be repealed. Clary explained that this was impossible, but he gave a formal pledge that he would not use it. The Czechs, however, prevented him passing a law on excise which was a necessary part of the agreements with Hungary; it was therefore impossible for him to carry on the government without breaking his word;

there was therefore nothing left for him to do but to resign, after holding office for less than three months. The emperor then appointed a ministry of officials, who were not bound by his pledge, and used paragraph 14 for the necessary purposes of state. They then made way for a ministry under Herr v. Körber. During the early months of 1900 matters were more peaceful, and Körber hoped to be able to arrange a compromise; but the Czechs now demanded the restoration of their language in the internal service of Bohemia, and on 8th June, by noise and disturbance, obliged the president to suspend the sitting. The Reichsrath was immediately dissolved, the emperor having determined to make a final attempt to get together a parliament with which it would be possible to govern. The new elections on which so much was to depend did not take place till January. They resulted in a great increase of the extreme German Nationalist parties. Schoenerer and the German Radicals—the fanatical German party who in their new programme advocated union of German Austria with the German Empire—now numbered twenty-one, who chiefly came from Bohemia. They were able for the first time to procure the election of one of their party in the Austrian Delegation, and threatened to introduce into the Assembly scenes of disorder similar to those which they had made common in the Reichsrath. All those parties which did not primarily appeal to national feeling suffered loss; especially was this the case with the two sections of the Clericals, the Christian Socialists and the Ultramontanes; and the increasing enmity between the German Nationalists (who refused even the name German to a Roman Catholic) and the Church became one of the most conspicuous features in the political situation. The loss of seats by the Socialists showed that even among the working men the national agitation was gaining ground; the diminished influence of the anti-Semites was the most encouraging sign.

Notwithstanding the result of the elections, the first months of the new Parliament passed in comparative peace. There was a truce between the nationalities. The Germans were more occupied with their opposition to the Clericals than with their feud with the Slavs. The Czechs refrained from obstruction, for they did not wish to forfeit the alliance with the Poles and Conservatives, on which their parliamentary strength depended, and the Germans used the opportunity to pass measures for promoting the material prosperity of the country, especially for an important system of canals which would bring additional prosperity to the coal-fields and manufactures of Bohemia. It is, however, impossible permanently to postpone the more contentious questions; it remains to be seen whether the influence of the moderate parties, the authority of the government, and the personal influence of the emperor will be able to restrain another outbreak of those passions which for a short time have to some extent been kept in check.

Austria, Lower (German, *Niederösterreich* or *Oesterreich unter der Enns*, i.e., Austria below the river Enns), an archduchy and crown land in the Cisleithan half of the Austro-Hungarian monarchy. It is bounded on the N. by Bohemia and Moravia, on the S. by Styria, on the E. by Hungary, and on the W. by Upper Austria. The chief town is Vienna, the capital of Austria, or the Cisleithan half of the dual monarchy. The original archduchy, which included the adjoining Upper Austria, is the birthplace and cradle of the Austrian empire, and the oldest possession of the House of Hapsburg in its present dominions. (For historical sketch see *Ency. Brit.* iii. 123.) Lower Austria has an area of 7654 square miles. It is divided into two parts by the Danube, which enters at its most westerly point and leaves at its eastern extremity, near Pressburg. North of this line is the low hilly country of the northern Alpine foreland, lying at the foot of, and forming a continuation of, the system of the Bohemian and Moravian plateau. This constitutes towards the west the "Waldviertel," of which the highest point is the Paulstein (3478 feet). Farther east there is a gradual decline in the altitude and frequency of the hills, which give place to larger valleys and comparatively fertile plains. In the main the southern division of the province is mountainous and hilly. Part of it is occupied by the northern or Austrian limestone Alps, of which the Schneeberg (6808 feet) is the highest summit. With one exception all the rivers are tributaries of the Danube. The most important are the Enns and the March. The lakes are comparatively few and of small extent. Of its mineral springs, the best known are those of Baden bei Wien and Deutsch Altenburg (sulphur), the iron springs of Pyrawarth, and the thermal baths of Vöslau. Lower Austria is remarkable among the provinces of the empire for the variety of its flora. In general the climate, which varies with the configuration of the surface, is moderate and healthy, although subject to rapid changes of temperature. It is mildest in the northern part and generally in the valleys. The soil is of moderate fertility, and only 3½ per cent. is unproductive. Woods occupy 34·24 per cent. of the total area, 43·41 per cent. is arable, 13·15 per cent. consists of gardens and meadows, 2 per cent. of vineyards, and 3·19 per cent. of pastures. Agriculture and forestry afford sustenance to about a quarter of the population. Cereals and vegetables of all kinds are cultivated. Some fair wine is grown on the slopes of the Wiener Wald and elsewhere, averaging 874,000 hectolitres per annum.

In 1890 there were 120,755 horses, 554,154 horned cattle, 115,052 sheep, 81,772 goats, and 412,703 pigs. Large quantities of poultry are also bred, and game and fish are plentiful. While mining is of comparatively slight significance (total value of product in 1897, £28,945), Lower Austria (including Vienna) is one of the most important industrial centres of the empire, surpassing in this respect all other provinces, excepting Bohemia and Moravia. It has 12 per cent. of the total number of factories, 13 per cent. of the motive power, and 16 per cent. of all the factory hands employed in Austria. Of the total of 69,636 industrial firms registered in 1890, 1367 were factories employing 139,000 hands.

With the exception of its connexion with the sea at Trieste, it is fairly well provided for in the matter of communications. In 1897 it had 1790 kilometres of railway (10·28 per cent. of the total length in Austria), 12,413 kms. of roads, and 319 kms. of navigable waterway. There were 698 post and 463 telegraph offices, with 3135 kms. of line and 14,601 of wire.

Population in 1869, 1,990,708; in 1880, 2,330,621; and in 1890,

including garrison of 31,363 men, 2,661,779, equivalent to 347·7 inhabitants per square mile. Thus, including Vienna, Lower Austria is the most populous Austrian province. Deducting the capital, however, with its population of 1,341,897, there are only 174 inhabitants per square mile. Proportion of females to males, 1036 to 1000. Reckoning according to the language in common use, 96·1 per cent. of the population is German, and 3·9 Slav. The latter, mostly Czechs, are settled in Vienna and on the Bohemian and Moravian border, while there are a number of Croats in the Marchfeld. Nearly 93 per cent. are Roman Catholic, the rest consisting of 128,784 Jews, 50,591 Protestants, 1356 Old Catholics, 2654 members of the Greek Church, and 2258 persons of no religion. Population in 1900, 3,086,382. In 1896 the marriage-rate was 8·43; the birth-rate, 33·83, or excluding still-births, 32·73; and the death-rate, 22·83 per thousand. Of the births 26·28 per cent. were illegitimate, an advancing ratio. The marriage-rate is rising, the birth- and death-rates are declining. Lower Austria sends 46 members to the Reichsrath, all of German nationality.

With the exception of Bohemia, Lower Austria is the most advanced province of the empire in the matter of elementary education. Both had the same proportion of illiterates in 1880 (8·5 per cent.), but in 1890 the improvement of Lower Austria (6·2 per cent.) was slightly behind that of Bohemia (5·8 per cent.). In the matter of higher education a comparison between the two would be unfair, in view of the special advantages enjoyed by the capital. In addition to the Vienna University, Polytechnic, School of Agriculture, and academies of commerce and of art, there are 19 gymnasias, 23 real gymnasias, 555 technical and special schools (of which a fifth are devoted to music and singing), and 1680 intermediate and elementary schools. Of the 1156 periodicals and newspapers published in 1898, 1102 were in German, 14 in French, 8 in Czech, 12 in other Slav languages, the rest being Italian, Hungarian, Hebraic, Spanish, and polyglott.

Austria, Upper (German, *Oberösterreich* or *Oesterreich ob der Enns*, "Austria above the river Enns"), an archduchy and crown-land in the Cisleithan half of the Austria-Hungarian monarchy. It is bounded on the N. by Bohemia, on the S. by Salzburg and Styria, on the W. by Bavaria, and on the E. by the archduchy of Lower Austria, from which it is separated by the river Enns. It has an area of 4627 square miles, of which 262 are occupied by the Salzkammergut. Like Lower Austria, it is divided into two unequal parts by the Danube, which flows through it from west to east, draining the whole country, with the exception of a small portion adjoining Bohemia. Its principal tributaries are the Inn, Salzach, Traun, Enns, Steyr, and the Great and Little Mühl rivers. The smaller northern part of the province is a prolongation of the southern angle of the Bohemian forest. The Danube is approached from the south by the verge of the Alpine region (the Salzkammergut and the Upper Austrian Alps). Towards the river there is a gradual decline in the altitude of the summits. Of the numerous and beautiful Alpine lakes, the most important are the Traunsee, and those of Hallstatt, Atter, Wolfgang, and Mond. There are about thirty mineral springs, the best known being the salt baths of Ischl and the iodine waters at Hall. The climate, which varies according to the altitude, is on the whole moderate, although slightly colder than that of Lower Austria, precluding the culture of the vine. In the north

it is somewhat severe, but is mild in the Salzkammergut.

The most populous and most important towns are Linz, the capital (58,788 inhabitants) and Steyr (17,592), both autonomous municipalities, Wels (12,187), Gmunden (7,126), Ischl, and Hallstatt. The last two are important centres of the salt industry. The soil in the valleys and on the lower slopes of the hills is fertile, indeed 35·08 of the whole area is arable. Woods occupy 34·02 per cent., while 4·93 per cent. is unproductive or consists of lakes, ponds, and marshes. It has the largest proportion of meadows in all Austria, 18·54, 2·49 per cent. of lowland and Alpine pasturage, and 1·99 per cent. of gardens. Agriculture and cattle breeding are both in an advanced state; relatively large quantities of the principal cereals are produced. Cattle breeding is equally advanced. In 1890 there were 553,074 head of horned cattle (the largest proportion of any Austrian province), 60,404 horses, 60,310 sheep, 31,592 goats, 247,902 pigs, and 33,125 beehives. Fish is artificially cultivated, and the wealth of game in the Salzkammergut (red deer, chamois, &c.) is a considerable resource of the province, as is also the important timber trade. Salt (a state monopoly) is the most valuable mineral. In 1897, Upper Austria produced 29·13 per cent. of the total Austrian product, its share being valued at £620,570. Other important products are lignite (£80,465), gypsum, and a variety of valuable stones and clays. The principal industries are the iron and metal manufactures, chiefly centred at Steyr, with its well-known small-arms factory. Next in importance are the machine, linen, cotton, and paper manufactures, the milling, brewing, and distilling industries and shipbuilding. The principal articles of export are salt, stone (including the granite pavements of Vienna), timber, live stock, wooden and iron wares, &c. In 1897 there were 864 kilometres of railway, 8,499 kms. of roads, and 618 kms. of waterway, of which only 249 kms. is available for floating timber. There were 370 post and 153 telegraph offices, with 1887 kms. of line, and 5428 kms. of wire. Pop. in 1869, 731,579; in 1880, 759,620; in 1890, 785,831; which is equivalent to 169·8 inhabitants per square mile, the greatest density of any of the Alpine provinces. It is almost exclusively German and Roman Catholic, the Czechs forming less than $\frac{1}{4}$ per cent., the Protestants 2·2 per cent., and the Jews 0·1 per cent. Population (1900), 809,918. In 1896 the marriage-rate was 7·11, the birth-rate 32·21, or excluding stillbirths 30·95, and the death-rate 23·31 per thousand. Of the births 18·71 per cent. were illegitimate, a declining ratio. The death-rate is also declining. The province sends 20 representatives to the Reichsrath, all German. Elementary education is practically on a level with that of Lower Austria, the proportion of illiterates (6·3 per cent.) being but $\frac{1}{10}$ per cent. less favourable. There are 534 elementary and 10 intermediate schools, 4 gymnasia, 2 real gymnasia, and 113 technical and special schools.

Autun, chief town of arrondissement, department of Saône-et-Loire, France, 66 miles N.N.W. of Macon, on railway from Paris to Lyons. It is noted for its educational establishments. The Hôtel de Ville, Palais de Justice, and theatre are modern buildings, and on the *Promenade des Marbres* is a bronze statue of Divitiacus (1893). The leading industry is now the extraction of mineral oil from bituminous schists; iron and bronze founding are also important. Population (1881), 10,695; (1896), 11,873, (comm.) 13,512; (1901), 15,764.

Auxerre, chief town of department Yonne, France, 105 miles S.E. of Paris, on railway from Laroche to Nevers. It has a tribunal and chamber of commerce. The ancient fortifications are replaced by boulevards. On the bridge over the Yonne is a statue of Paul Bert (d. 1886). The principal manufactures now are heavy iron goods, machinery, tools, waggons, and carriages, and there are important ochre works. Population (1881), 13,752; (1891), 14,553; (1896), 15,082; (1901), 18,901.

Auxonne, a town in the arrondissement of Dijon, department of Côte d'Or, France, 19 miles E.S.E. of Dijon, on railway to Belfort. There is a tribunal of commerce. The artillery school has been removed to Besançon.

Population (1881), 3002; (1891), 2938; (1896), 2873, (comm.) 4529; (1901), 7706.

Ava, formerly the capital of Burma for nearly 400 years, from 1364 to 1733, with a succession of thirty kings, but now merely a subdivision of the Sagaing district in the northern division of Upper Burma. It formed a separate district from the date of its annexation by the British (1886) until 1889, and was then amalgamated with Sagaing on the opposite bank of the Irrawaddy. For picturesque beauty it is unequalled in Burma, but it is now more like a park than the site of an old capital. The township had a population of 39,477 in 1891, and it is likely to remain what it was when the British first occupied it—a collection of cultivators' hamlets scattered amidst the remains of former greatness. Some of the pagodas were founded nearly a thousand years ago.

Avebury, John Lubbock, 1st BARON (1834—), English banker, politician, and naturalist, was born in London, 30th April 1834, being the son of Sir John William Lubbock, third baronet, himself a highly distinguished man of science. John Lubbock was sent to Eton in 1845; but three years later (when only fourteen years of age) was taken into his father's bank, and became a partner at twenty-two. In 1865 he succeeded to the baronetcy. His love of science kept pace with his increasing participation in public affairs. He served on commissions upon coinage and other financial questions; and at the same time acted as president of the Entomological Society, and of the Anthropological Institute. Early in his career several banking reforms of great importance were due to his initiative, while such works as *Prehistoric Times* (1865) and *The Origin of Civilisation* (1870) were proceeding from his pen. In 1870, and again in 1874, he was elected member of Parliament for Maidstone. He lost the seat at the election of 1880; but was at once elected member for London University, of which he had been vice-chancellor since 1872. He held this seat until his elevation to the peerage in 1900. He carried numerous enactments in parliament, including the Bank Holidays Act (1871), and bills dealing with absconding debtors, shop hours regulations, public libraries, open spaces, and the preservation of ancient monuments. He was elected the first president of the Institute of Bankers in 1879; in 1881 he was president of the British Association, and from 1881 to 1886 president of the Linnæan Society. He has received honorary degrees from the Universities of Oxford, Cambridge (where he was Rede lecturer in 1886), Edinburgh, Dublin, and Würzburg; and in 1878 was appointed a trustee of the British Museum. From 1888 to 1892 he was president of the London Chamber of Commerce; from 1889 to 1890 vice-chairman, and from 1890 to 1892 chairman, of the London County Council. During the same period he served on royal commissions on education and on gold and silver. In 1890 he was appointed privy councillor; and was chairman of the committee of design on the new coinage in 1891. In January 1900 he was raised to the peerage, under the title of Baron Avebury. As a thoughtful popularizer of natural history and philosophy he has had few rivals in his day, as is evidenced by the number of editions issued of many of his writings, among which the most widely-read have been: *The Origin and Metamorphoses of Insects* (1873), *British Wild Flowers* (1875), *Ants, Bees, and Wasps* (1882), *Flowers, Fruit, and Leaves* (1886), *The Pleasures of Life* (1887), *The Senses, Instincts, and Intelligence of Animals* (1888), *The Beauties of Nature* (1892), *The Uses of Life* (1894).

Aveiro, a seaport town and episcopal see of Portugal, capital of the district of Aveiro, on a lagoon of the same

name and the principal arm of the Vouga. The industries embrace the preparation of salt, the catching and curing of fish, and the gathering of aquatic plants (*molico*). It was the birthplace of João Affonso, the discoverer, one of the first navigators to visit the fishing grounds of Newfoundland. The channel through the bar, which connects the lagoon with the sea, has a maximum depth of 33 ft. Population, 8860. The district of Aveiro is 48 miles long by 30 miles wide, with an area of 1146 sq. miles, and population of 291,526, giving a density of 255 inhabitants to the sq. mile. It contains part of the fine wine district of Bairrada, and is a good grazing region. There are copper and lead mines.

Avellino, capital of the province of Avellino, Campania, Italy, 59 miles by rail E.N.E. from Naples. On Monte Vergine, at the foot of which the town stands, is the monastery (1119) of Monte Vergine, which is visited at Whitsuntide and every 7th and 8th September by nearly 80,000 pilgrims, the attraction being a wonder-working image of the Virgin. At Avellino an ancient necropolis was discovered in 1898. There are schools of viticulture and the industrial arts. Population of town (1901), 23,790; of province (1901), 402,898.

Average.—Some considerable changes in relation to *General Average* have to be noted since the appearance of the article on this subject in the ninth edition of this work. The difficulty, which then seemed nearly insuperable, of bringing together the rules in force in the several maritime countries has been to a large extent overcome—not by legislation, but by framing a set of rules covering the principal points of difference in such a manner as to satisfy, on the whole, those who are practically concerned, and to lead them to adopt these rules in their contracts of affreightment and contracts of insurance. The honour of the achievement belongs to a small number of men who recognized the need of uniformity. The work began in May 1860 at a congress held at Glasgow, under the presidency of Lord Brougham, assisted by Lord Neaves. Further congresses were held in London (1862), and at York (1864), when a body of rules known as the “York Rules” was agreed to. There the matter stood, until it was taken up by the “Association for the Reform and Codification of the Law of Nations” at conferences held at the Hague (1875), Bremen (1876), and Antwerp (1877). Some changes were made in the “York Rules”; and so altered, the body of rules was adopted at the last-named conference, and was styled the “York and Antwerp (or York-Antwerp) Rules.” The value of these rules was quickly perceived, and practical use of them followed. But they proved to be insufficient, or unsatisfactory, on some points; and again, in the autumn of 1890, a conference on the subject was held, this time at Liverpool, by the same Association, under the able presidency of Dr F. Sieveking, president of the Hanseatic High Court of Appeal at Hamburg. Important changes were then made, carrying further certain departures from English law, already apparent in the earlier rules, in favour of views prevailing upon the continent of Europe and in the United States. The new rules were styled the York-Antwerp Rules, 1890. In practice they quickly displaced those of 1877; and in 1892, at a conference of the same Association held at Genoa, it was formally declared that the only International Rules of General Average having the sanction and authority of the Association were the York-Antwerp Rules as revised in 1890, and that the original rules were rescinded. It is this later body of rules which is now known as the York-Antwerp Rules. Reference is

now to be found in most English contracts of carriage, and contracts of insurance, to these rules, as intended to govern the adjustment of G. A. between the parties; with the result that (so far as the rules cover the ground) adjustments do not depend upon the law of the place of destination, and so do not vary according to the destination, or the place at which the voyage may happen to be broken up, as used formerly to be the case.

The rules are as follows:—

RULE I.—JETTISON OF DECK CARGO.

No jettison of deck cargo shall be made good as G. A.

Every structure not built in with the frame of the vessel shall be considered to be a part of the deck of the vessel.

RULE II.—DAMAGE BY JETTISON AND SACRIFICE FOR THE COMMON SAFETY.

Damage done to a ship and cargo, or either of them, by or in consequence of a sacrifice made for the common safety, and by water which goes down a ship's hatches opened, or other opening made for the purpose of making a jettison for the common safety shall be made good as G. A.

RULE III.—EXTINGUISHING FIRE ON SHIPBOARD.

Damage done to a ship and cargo, or either of them, by water or otherwise, including damage by beaching or scuttling a burning ship, in extinguishing a fire on board the ship, shall be made good as G. A.; except that no compensation shall be made for damage to such portions of the ship and bulk cargo, or to such separate packages of cargo, as have been on fire.

RULE IV.—CUTTING AWAY WRECK.

Loss or damage caused by cutting away the wreck or remains of spars, or of other things which have previously been carried away by sea-peril, shall not be made good as G. A.

RULE V.—VOLUNTARY STRANDING.

When a ship is intentionally run on shore, and the circumstances are such that if that course were not adopted she would inevitably sink, or drive on shore or on rocks, no loss or damage caused to the ship, cargo, and freight, or any of them, by such intentional running on shore, shall be made good as G. A. But in all other cases where a ship is intentionally run on shore for the common safety, the consequent loss or damage shall be allowed as G. A.

RULE VI.—CARRYING PRESS OF SAIL—DAMAGE TO OR LOSS OF SAILS.

Damage to or loss of sails and spars, or either of them, caused by forcing a ship off the ground or by driving her higher up the ground, for the common safety, shall be made good as G. A.; but where a ship is afloat, no loss or damage caused to the ship, cargo, and freight, or any of them, by carrying a press of sail, shall be made good as G. A.

RULE VII.—DAMAGE TO ENGINES IN REFLOATING A SHIP.

Damage caused to machinery and boilers of a ship which is ashore and in a position of peril, in endeavouring to refloat, shall be allowed in G. A., when shown to have arisen from an actual intention to float the ship for the common safety at the risk of such damage.

RULE VIII.—EXPENSES OF LIGHTENING A SHIP WHEN ASHORE, AND CONSEQUENT DAMAGE.

When a ship is ashore, and, in order to float her, cargo, bunker coals, and ship's stores, or any of them, are discharged, the extra cost of lightening, lighter hire, and reshipping (if incurred), and the loss or damage sustained thereby, shall be admitted as G. A.

RULE IX.—CARGO, SHIP'S MATERIALS, AND STORES BURNT FOR FUEL.

Cargo, ship's materials, and stores, or any of them, necessarily burnt for fuel for the common safety at a time of peril, shall be admitted as G. A., when and only when an ample supply of fuel had been provided; but the estimated quantity of coals that would have been consumed, calculated at the price current at the ship's last port of departure at the date of her leaving, shall be charged to the shipowner and credited to the G. A.

RULE X.—EXPENSES AT PORT OF REFUGE, &c.

(a) When a ship shall have entered a port or place of refuge, or shall have returned to her port or place of loading, in consequence of accident, sacrifice, or other extraordinary circumstances, which render that necessary for the common safety, the expenses of entering such port or place shall be admitted as G. A.; and when she shall have sailed thence with her original cargo, or a part of it, the corresponding expenses of leaving such port or place, consequent upon such entry or return, shall likewise be admitted as G. A.

(b) The cost of discharging cargo from a ship, whether at a port or place of loading, call, or refuge, shall be admitted as G. A., when the discharge was necessary for the common safety or to enable damage to the ship, caused by sacrifice or accident during the voyage, to be repaired, if the repairs were necessary for the safe prosecution of the voyage.

(c) Whenever the cost of discharging cargo from a ship is admissible as G. A., the cost of reloading and storing such cargo on board the said ship, together with all storage charges on such cargo, shall likewise be so admitted. But when the ship is condemned or does not proceed on her original voyage, no storage expenses incurred after the date of the ship's condemnation or of the abandonment of the voyage shall be admitted as G. A.

(d) If a ship under average be in a port or place at which it is practicable to repair her, so as to enable her to carry on the whole cargo, and if, in order to save expenses, either she is towed thence to some other port or place of repair or to her destination, or the cargo or a portion of it is transhipped by another ship, or otherwise forwarded, then the extra cost of such towage, transhipment, and forwarding, or any of them (up to the amount of the extra expense saved), shall be payable by the several parties to the adventure in proportion to the extraordinary expense saved.

RULE XI.—WAGES AND MAINTENANCE OF CREW IN PORT OF REFUGE, &c.

When a ship shall have entered or shall have been detained in any port or place under the circumstances, or for the purposes of the repairs, mentioned in Rule X., the wages payable to the master, officers, and crew, together with the cost of maintenance of the same, during the extra period of detention in such port or place until the ship shall or should have been made ready to proceed upon her voyage, shall be admitted as G. A. But when the ship is condemned or does not proceed on her original voyage, the wages and maintenance of the master, officers, and crew, incurred after the date of the ship's condemnation or of the abandonment of the voyage, shall not be admitted as G. A.

RULE XII.—DAMAGE TO CARGO IN DISCHARGING, &c.

Damage done to or loss of cargo necessarily caused in the act of discharging, storing, reloading, and stowing, shall be made good as G. A. when and only when the cost of those measures respectively is admitted as G. A.

RULE XIII.—DEDUCTIONS FROM COST OF REPAIRS.

In adjusting claims for G. A., repairs to be allowed in G. A. shall be subject to the following deductions in respect of "new for old," viz. :—

In the case of *iron or steel ships*, from date of original register to the date of accident :—

Up to 1 year old (A.)	{ All repairs to be allowed in full, except painting or coating of bottom, from which one-third is to be deducted.
Between 1 and 3 years (B.)	{ One-third to be deducted off repairs to and renewal of woodwork of hull, masts, and spars, furniture, upholstery, crockery, metal and glassware, also sails, rigging, ropes, sheets, and hawsers (other than wire and chain), awnings, covers, and painting. One-sixth to be deducted off wire rigging, wire ropes and wire hawsers, chain cables and chains, donkey engines, steam winches and connexions, steam cranes and connexions; other repairs in full.
Between 3 and 6 years (C.)	{ Deductions as above under clause B, except that one-sixth be deducted off ironwork of masts and spars, and machinery (inclusive of boilers and their mountings).
Between 6 and 10 years (D.)	{ Deductions as above under clause C, except that one-third be deducted off ironwork of masts and spars, repairs to and renewal of all machinery (inclusive of boilers and their mountings), and all hawsers, ropes, sheets, and rigging.
Between 10 & 15 years (E.)	{ One-third to be deducted off all repairs and renewals, except ironwork of hull and cementing and chain cables, from which one-sixth to be deducted. Anchors to be allowed in full.
Over 15 years (F.)	{ One-third to be deducted off all repairs and renewals. Anchors to be allowed in full. One-sixth to be deducted off chain cables.
Generally (G.)	{ The deductions (except as to provisions and stores, machinery, and boilers) to be regulated by the age of the ship, and not the age of the particular part of her to which they apply. No painting bottom to be allowed if the bottom has not been painted within six months previous to the date of accident. No deduction to be made in respect of old material which is repaired without being replaced by new, and provisions and stores which have not been in use.

In the case of *wooden or composite ships* :—

When a ship is under one year old from date of original register, at the time of accident, no deduction "new for old" shall be made. After that period a deduction of one-third shall be made, with the following exceptions :—

Anchors shall be allowed in full. Chain cables shall be subject to a deduction of one-sixth only.

No deduction shall be made in respect of provisions and stores which had not been in use.

Metal sheathing shall be dealt with, by allowing in full the cost of a weight equal to the gross weight of metal sheathing stripped off, minus the proceeds of the old metal. Nails, felt, and labour metalling are subject to a deduction of one-third.

In the case of *ships generally* :—

In the case of all ships, the expense of straightening bent ironwork, including labour of taking out and replacing it, shall be allowed in full.

Graving dock dues, including expenses of removals, cartages, use of shears, stages, and graving dock materials, shall be allowed in full.

RULE XIV.—TEMPORARY REPAIRS.

No deductions "new for old" shall be made from the cost of temporary repairs of damage allowable as G. A.

RULE XV.—LOSS OF FREIGHT.

Loss of freight arising from damage to or loss of cargo shall be made good as G. A., either when caused by a G. A. act or when the damage to or loss of cargo is so made good.

RULE XVI.—AMOUNT TO BE MADE GOOD FOR CARGO LOST OR DAMAGED BY SACRIFICE.

The amount to be made good as G. A. for damage or loss of goods sacrificed shall be the loss which the owner of the goods has sustained thereby, based on the market values at the date of the arrival of the vessel or at the termination of the adventure.

RULE XVII.—CONTRIBUTORY VALUES.

The contribution to a G. A. shall be made upon the actual values of the property at the termination of the adventure, to which shall be added the amount made good as G. A. for property sacrificed; deduction being made from the shipowner's freight and passage-money at risk, of such port charges and crew's wages as would not have been incurred had the ship and cargo been totally lost at the date of the G. A. act or sacrifice, and have not been allowed as G. A.; deduction being also made from the value of the property of all charges incurred in respect thereof subsequently to the G. A. act, except such charges as are allowed in G. A.

Passengers' luggage and personal effects, not shipped under bill of lading, shall not contribute to G. A.

RULE XVIII.—ADJUSTMENT.

Except as provided in the foregoing rules, the adjustment shall be drawn up in accordance with the law and practice that would have governed the adjustment had the contract of affreightment not contained a clause to pay G. A. according to these rules.

The above rules differ in some important respects from English common law, and from former English practice. They follow ideas upon the subject of G. A. which have prevailed in practice in foreign countries (though often in apparent opposition to the language of the codes), in preference to the more strict principle of the common law applied by English courts. That principle requires that, in order to have the character of G. A., a sacrifice or expenditure must be made for the common *safety* of the several interests in the adventure, and under the pressure of a common risk. It is not enough that the sacrifice or expenditure is prudent, or even necessary to enable the common adventure to be completed. G. A., on the English view, only arises where the *safety* of the several interests is at stake. "The idea of a common commercial adventure, as distinguished from the common safety from the sea," is not recognized. It is not sufficient "that an expenditure should have been made to benefit both cargo owner and shipowner."¹

Thus expenses incurred after ship and cargo are in safety, say at a port of refuge, are not generally, by English law, to be treated as G. A.; although the putting into port may have been for safety, and therefore a G. A. act. If the putting into port has been necessitated by a G. A. sacrifice, as by cutting away the ship's masts, the case is different; the port expenses, the expenses of repairing the G. A. Port of refuge expenses.

¹ Per Bowen, L.J., in *Svensden v. Wallace*, 13 Q.B.D. at p. 84.

damage, and the incidental expenses of unloading, storing, and reloading the cargo are, in such a case, treated as consequences of the original sacrifice, and therefore subjects for contribution. But where the reason for putting in is to avoid some danger, such as a storm or hostile cruiser, or to effect repairs necessitated by some accidental damage to the ship, the G. A. sacrifice is considered to be at an end when the port has been reached, if the ship and cargo are then in physical safety. The subsequent expenditure in the port is said not to flow from that sacrifice, but from the necessity of completing the voyage, and is incurred in performance of the shipowner's obligation under his contract. The practice of English average adjusters has indeed modified this strict view by treating the expenses of unloading as G. A.; but it may well be doubted whether that practice can be legally supported. Moreover, expenditure in the port which is incurred in protecting the cargo as in warehousing it, is by English practice treated as a charge to be borne by the cargo for whose benefit it was incurred.

If we turn now to York-Antwerp, Rule X., it will be seen that a much broader view is adopted. Whatever the reason for putting into the port of refuge, provided it was necessary for the common safety, the expenses of going in, and the consequent expenses of getting out (if she sails again with all or part of her original cargo), are allowed as G. A., Rule X. (a). Further, the cost of discharging the cargo to enable damage to the ship to be repaired, whether caused by sacrifice or by accident during the voyage, is to be allowed as G. A., "if the repairs were necessary for the safe prosecution of the voyage," Rule X. (b). And that is to be so even where such repairs are done at a port of call, as well as where done at a port of refuge. Again, when the cost of discharging is treated as G. A., so also are to be the expenses of storing the cargo on shore, and of reloading and stowing it on board, after the repairs have been done, (Rule X. (c)), together with any damage or loss incidental to those operations (Rule XII.).

Further, by Rule XI. the wages of the master, officers, and crew, and the cost of their maintenance, during the detention of a ship under the circumstances, or for the purpose of the repairs mentioned in Rule X., are to be allowed in G. A. It is questionable whether English law allows the wages and maintenance of the crew at a port of refuge in any case. Where the detention is to repair accidental damage it seems clear that they are not allowed. And in practice, under common law, the allowance is never made; so that Rule XI. is an important concession to the shipowner. Like the changes introduced by Rule X., it is a change towards the practice in foreign countries.

It may be noted that the rules do not afford equal protection to a shipper in the comparatively infrequent case of his being put to expense by the delay at a port of refuge. Thus a shipper of cattle is not entitled to have the extra wages and provisions of his cattle-men on board, nor the extra fodder consumed by the cattle during the stay at a repairing port, made good as G. A. under Rules XI. and X. (*Anglo-Argentine, &c., Agency v. Temperley Co.*, 1899, 2 Q.B. 408).

As to the acts which amount to G. A. sacrifices, as distinguished from expenditures, the York-Antwerp Rules do not much alter English common law. They do, however, make definite provisions upon some points on which authority was scanty or doubtful. (See Rules I.-IX.). And in Rule I., as to jettison of deck cargo, a change is made from the common law rule, for the jettison is not allowed as G. A. even though the cargo be carried on deck in accordance with an established custom of the particular trade.

Rule III. deals with damage done in extinguishing fire on board a ship. Modern decisions have cleared away the old doubts whether such damage to ship or cargo should, at law, be allowed in G. A. But recent cases in the United States have raised the question whether the allowance should be made where the fire occurs in port, and is extinguished, not by the master, but by a public authority acting in the interests of the public. The Supreme Court of the United States decided against the allowance in 1894, in a case of *Ralls v. Troup* (157 U.S. 386). The ship had there been scuttled to put out a fire on board, by the port authority, acting upon their own judgment, but with the assent of the master. It was held that the damage suffered by ship and cargo ought not to be made good by G. A. contributions; for the sacrifice had not been made "by some one specially charged with the control and safety of that adventure," but was the compulsory act of a public authority. On the other hand, in the English case of *Papayanni v. Grampian S.S. Co.* (I. Com. Ca. 448), Mathew, J., held that the scuttling of a ship at a port of refuge in Algeria, by orders of the captain of the port, was a G. A. act. It had been done in the interest of ship and cargo, and there was no evidence of any other motive.

Rule V. deals with the question whether, and under what conditions, a voluntary stranding of the ship is a G. A. act, in a manner which will probably be held to express the law in England when the matter comes up for decision.

Rules VI. and VII. deal with the damage sustained by the ship, or her appliances, in efforts to force her off the ground when she has stranded. Such efforts involve an abnormal use which is likely

to cause damage to sails and spars, or to engines and boilers; and they are treated as acts of sacrifice. A recent case (*The Bona*, 1895, P. 125), in the court of appeal, shows that the rules are in accord with English law upon the point. The court held that both the damage sustained by the engines while worked to get the ship off, and the coal and stores consumed, were subjects for G. A. contribution at common law.

Rule VIII. allows as G. A. any damage sustained by cargo when discharged and, say, lightered for the purpose of getting the ship off a strand. And the corresponding damage in the case of cargo discharged at a port of refuge to enable repairs to be done to the ship is allowed by Rule XII. But in the latter case the allowance does not expressly extend to damage sustained while stored on land. Whether the law would require contribution to a loss of goods, say, by thieves or by fire, while landed for repairs, is not clear. Where the landing has been necessitated by a G. A. act, as cutting away masts, it would seem that the loss ought to be made good, as being a result of the special risks to which those goods have thereby been exposed. The risks which they would have run if they had remained on board throughout are taken into account, as will presently appear, in estimating how much of the damage is to be made good.

Where cattle were taken into a port of refuge in Brazil, owing to accidental damage to the ship, with the result that they could not legally be landed at their destination (Deptford), and had to be taken to another port (Antwerp), at which they were of much less value, this loss of value was allowed in G. A. (*Anglo-Argentine, &c., Agency v. Temperley Co.*, 1899, 2 Q.B. 408).

The case of a stranded ship and cargo often gives rise to difficulty as to whether the cost of operations to lighten the ship, and afterwards to get her floated, should be treated as G. A. expenditure, or as expenses separately incurred in saving the separate interests. The true conclusion seems to be that either the whole operation should be treated as one for the common safety, and the whole expense be contributed to by all the interests saved, or else the several parts of the operation should be kept distinct, debiting the cost of each to the interests thereby saved. Which of these two views should be adopted in any case seems to depend upon the motives with which the earlier operations (usually the discharge of the cargo) were presumably undertaken. It may, however, happen that this test cannot be applied once for all. Take the case of a stranded ship carrying a bulky cargo of hemp and grain, but carrying also some bullion. Suppose this last to be rescued and taken to a place of safety at small expense in comparison with its value. It may well be that that operation must be regarded as done in the interest simply of the bullion itself, but that the subsequent operations of lightening the ship and floating her can only be properly regarded as undertaken in the common interest of ship, hemp, grain, and freight. In such a case there will be a G. A. contribution towards those later operations by those interests. But the bullion will not contribute; it will merely bear the expense of its own rescue (*Royal Mail S. P. Co. v. English Bank of Rio*, 19 Q.B.D. 362).

The York-Antwerp Rules have not only had the valuable result of introducing uniformity where there had been great variety, and corresponding certainty as to the principles which will be acted upon in adjusting any G. A. loss, but also they have introduced greater clearness and definiteness on points where there had been a want of definition. Thus Rule XIII. has laid down a careful and definite scale to regulate the deductions from the cost of repairs, in respect of "new for old," in place of the former somewhat uncertain customary rules which varied according to the place of adjustment; while at the same time the opportunity has been taken of adapting the scale of deductions to modern conditions of shipbuilding. And Rule XVII. lays down a rule as to contributory values in place of the widely varying rules of different countries as to the amounts upon which ship and freight shall contribute (cf. Gow, *Marine Insurance*, 305).

The adjustment of G. A., that is to say, the calculation of the amounts to be made good to and paid by the several interests, is a complicated matter. It involves much detail and arithmetic, and requires a full and accurate knowledge of the principles of the subject. Such adjustments are made by men who make the subject their profession. In Great Britain they are for the most part members of the Average Adjusters' Association, a body which has done and is doing much careful work with a view to making and keeping the practice uniform and in accord with right principles. This association has gradually formulated, at their annual meetings, a body of practical rules which the individual members undertake to observe. They will be found in the annual reports of the society (and see Gow, *Marine Insurance*, 330).

Adjust-
ment of
General
Average.

It may be of interest to refer briefly to one or two main principles which govern an adjustment. The fundamental idea is that the several interests at risk shall contribute in proportion to the benefits they have severally received by the completion of the adventure. Contributions are not made in proportion to the amounts at stake when the sacrifice was made, but in proportion to the results when the adventure has come to an end. An interest which has become lost after the sacrifice, during the subsequent course of the voyage, will pay nothing; an interest which has become depreciated will pay in proportion to the diminished value. The liability to contribute is inchoate only when the sacrifice has been made. It becomes complete when the adventure has come to an end, either by arrival at the destination, or by having been broken up at some intermediate point, while the interest in question still survives. To this there is one exception, in the case of *G. A. expenditure*. Where such expenditure has been incurred by the owner of one interest, generally by the shipowner, the repayment to him by the other interests ought not to be wholly dependent upon the subsequent safety of those interests at the ultimate destination. If those other interests or some of them arrive, or are realized, as by being landed at an intermediate port, the rule (as in the case of *G. A. sacrifices*) is that the contributions are to be in proportion to the arrived or realized values. But if all are lost the burden of the expenditure ought not to remain upon the interest which at first bore it; and the proper rule seems to be that contributions must be made by all the interests which were at stake when it was made, in proportion to their *then* values.

Again, the object of the law of *G. A.* is to put one whose property is sacrificed upon an equal footing with the rest, not upon a better footing. Thus, if goods to the value of £100 have been thrown overboard for the general safety, the owner of those goods must not receive the full £100 in contribution. He himself must bear a part of it, for those goods formed part of the adventure for whose safety the jettison was made; and it is owing to the partial safety of the adventure that any contribution at all is received by him. He therefore is made to contribute with the other saved interests towards his own loss, in respect of the amount "made good" to him for that. The full £100 is treated as the amount to be made good, but the owner of the goods is made to contribute towards that upon the sum of £100 thus saved to him.

The same principle has a further consequence. The amount to be made good will not necessarily be the value of the goods or other property in their condition at the time they were sacrificed; so to calculate it would in effect be to withdraw those goods from the subsequent risks of the voyage, and thus to put them in a better position than those which were not sacrificed. Hence, in estimating the amount to be made good, the value of the goods or property sacrificed must be estimated *as on arrival*, with reference to the condition in which they would probably have arrived had they remained on board throughout the voyage.

The liability to pay *G. A.* contributions falls primarily upon the owner of the contributing interest, ship, goods, or freight. But in practice the contributions are paid by the insurers of the several interests. Merchants seldom have to concern themselves with the subject. And yet in an ordinary policy of insurance there is no express provision requiring the underwriter to indemnify the assured against this liability. The policy commonly contains clauses which recognize such an obligation, *e.g.*, a warranty against average "unless general," or an agree-

ment that *G. A.* shall be payable "as per foreign statement," or "according to York-Antwerp Rules"; but it does not directly state the obligation. It assumes that. The explanation seems to be that the practice of the underwriter to pay the contribution has been so uniform, and his liability has been so fully recognized, that express provisions were needless. But one result has been that very differing views of the ground of the obligation have been held. One view has been that it is covered by the sue and labour clause of an ordinary policy, by which the insurer agrees to bear his proportion of expenses voluntarily incurred "in and about the defence, safeguard, and recovery" of the insured subject. But that has been held to be mistaken by the House of Lords (*Aitchison v. Lohre*, 4 A.C. 755). Another view is that the underwriter impliedly undertakes to repay sums which the law may require the assured to pay towards averting losses which would, by the contract, fall upon the underwriter. Expenses voluntarily incurred by the assured with that object are expressly made repayable by the sue and labour clause of the policy. It might well be implied that payments compulsorily required from the assured by law for contributions to *G. A.*, or as salvage for services by salvors, will be undertaken or repaid by the underwriter, the service being for his benefit. But the decision in *Aitchison v. Lohre* negatives this ground also. The claim was against underwriters on a ship which had been so damaged that the cost of repairs had exceeded her insured value. A claim for the ship's contribution to certain salvage and *G. A.* expenses which had been incurred, over and above the cost of repairs, was disallowed. The view seems to have been that the insurer is liable for salvage and *G. A.* payments as losses of the subject insured, and therefore included in the sum insured, not as collateral payments made on his behalf. This bases the claim against the insurer upon a fiction, for there has been no loss of the subject insured; in fact, the payment has been for averting such a loss. And it suggests that the insurer is not liable for salvage where the policy is free of particular average, which does not accord with practice.

An important question as to an insurer's liability for *G. A.* arose recently in the case of the *Brigella* (1893, P. 189), where a shipowner had incurred expenses which would have been the subject of *G. A.* contributions, but that he alone was interested in the voyage. There were no contributories. He claimed from the insurers of the ship what would have been the ship's *G. A.* contribution had there been other persons to contribute in respect of freight or cargo. The claim was disallowed on the ground that there could be no *G. A.* in such circumstances, and therefore no basis for a claim against the insurer. The liability of the insurer was thus made to depend, not upon the character of the loss, but upon the fact of contribution or possibility of contribution. But this was not followed in *Montgomery v. Idemvity Co.* (1900, 6 Com., Ca. 19). There ship, freight, and cargo all belonged to the same person. He had insured the cargo but not the ship. The cargo underwriters were held liable to pay a contribution to damage done to the ship by cutting away masts for the general safety. The loss was in theory spread over all the interests at risk, and they had undertaken to bear the cargo's share of such losses. Their liability did not depend upon the accident of whether the interests all belonged to one person or not. This agrees with the view taken in the United States.

As to *Particular Average*, see under **INSURANCE (Marine)**.

1892.—ARNOULD's *Marine Insurance*, 7th ed., London, 1901.—CARVER's *Carriage by Sea*, 3rd ed., London, 1900. (T. G. C.)

Aversa, a garrison town and episcopal see of the province of Caserta, Campania, Italy, 13 miles N. from Naples by rail. A good wine is made in the neighbourhood. There are manufactures of hemp, cotton, and furniture, and a technical school. Population (1881), 21,176; (1901), 23,477.

Aveyron, a French department on the rim of the Central Plateau.

Area, 3386 square miles, with 43 cantons and 302 communes. The population, 415,826 in 1886, had fallen to 382,074 in 1901. The births (1899) were 8893, of which 277 were illegitimate; deaths, 8811; marriages, 2816. The people of Aveyron emigrate in large numbers to South America. In 1896 there were 1457 primary schools, with 70,000 pupils. One and a half per cent. of the population was illiterate. The chief towns are Rodez (16,000 inhabitants in 1896; the capital), Espalion, Millau, St Affrique, Villefranche, and Decazeville. The area under cultivation in 1896 comprised 1,469,650 acres, of which 904,020 acres were ploughland, 46,930 acres vineyard, and 29,640 acres grass. In 1899, wheat yielded a revenue of £598,225, and the production of rye, oats, and potatoes in the same year amounted to 2,220,000 cwt. It takes the seventh rank for the production of hemp. Vine productions were valued at £111,000, and it grows a great abundance of walnuts and chestnuts. The live stock in 1899 numbered 921,250 head, 722,000 of which were sheep. Mining in 1898 produced 1,020,000 tons of coal, 9000 tons of iron, and 600 tons of other minerals, especially argentiferous lead in the basin of Decazeville. The production in metals in 1898 did not, however, exceed 34,000 tons of iron, cast-iron, and steel, and its value, including that of the other metals, was not more than £380,000. The other industries are leather-dressing and glove-making (Millau), the making of cheese, for which Roquefort is especially noted, and the weaving of coarse wool.

Avignon, chief town of department Vaucluse, France, 453 miles S.S.E. of Paris, on railway from Lyons to Marseilles. The library contains about 117,000 volumes and 3300 manuscripts. The north and oldest part of the Papal palace, restored in the 19th century, is now the depository of the public archives. The 15th-century Benedictine church of St Martial, partly in ruins, contains a magnificent tomb of Urban V. The ancient city gates have been in part destroyed, including the Porte d'Imbert (1896). Modern monuments are the Centenaire, erected in 1891, to commemorate the union of the Comtat Venaissin with France, and the statue of the Persian, Jean Althen, who in 1765 introduced the culture of the madder plant, which long formed the staple, and still forms an important branch, of local trade. John Stuart Mill died here in 1873, and is buried in the cemetery to the east of the town. Population (1881), 26,919; (1901), 46,896.

Avila, a province of Central Spain, with an area of 2570 square miles. It is divided into 6 districts and 270 parishes. There are valuable forests of oak, beech, and many varieties of firs. The ducal house of Medina Sidonia has turned vast extents of old pasture-lands and mountains into productive pine-woods. More than a million and a half of acres are cultivated, only about 2 per cent. of which are well irrigated. The official statistics show 133,200 acres producing wheat, 94,250 acres producing other cereals, 58,750 pod fruit, 32,377 vines, and 14,582 olive. The live stock includes 9125 horses, 9300 mules, 20,348 donkeys, 60,329 cattle, 479,254 sheep, 94,356 goats, and 37,930 pigs. The means of communication are not abundant, especially in the mountainous districts. The Great Northern Railway places the province in communication with Madrid and France; there are about 155 miles of fairly good roads. The exports are chiefly cereals and live stock; imports—manufactured goods, colonial products, machinery, and cod-fish. In 1887 the population was 132,000; in 1897, 197,636. The average of births is 4·08 per cent., of deaths 3·63 per

cent., and the proportion of illegitimates is 0·13 per cent. The proportion of illiterates is 37 per cent.

Avila, a town of Spain, capital of the modern province of Avila, on the river Adaja, with a station on the line from Madrid to Valladolid. The climate is temperate in summer and very cold in winter, snow often then lying more than a foot deep. There is a considerable trade in agricultural products, live stock, leather, pottery, and manufactures of hats, linen, and cotton goods. The institute, the normal schools for teachers of both sexes, and several primary schools are well attended. Here is situated the royal school of cadets for the army commissariat corps. In the convent of the Encarnacion is the cell of Santa Theresa de Jesus, and there are remains of the old alcazar, now turned into barracks. The bishop of Avila is now a suffragan of the archbishop of Valladolid. Population (1897), 11,712.

Aviles, or SAN NICOLAS DE AVILES, a port in the province of Oviedo, Spain. Population, 11,749. The trade, especially along the coast, has much increased of late years, the means of communication having been improved in the surrounding districts.

Avintes, a town of Portugal, district of Oporto, on the left bank of the Douro, 4 miles above Villa Nova de Gaia, one of the handsomest suburbs of Oporto, which it supplies with vegetables, &c. Population, 5100.

Avlona, or VALONA (Albanian *Vlora*), a kaimaklik of the vilayet of Janina, Turkey, and the nearest seaport to Italy on the Albanian coast. Its population is officially stated to be 6000. The surrounding district is agricultural and pastoral, producing oats, maize, cotton, olive oil, valonea, cattle, sheep, skins, hides, and butter. All these articles are exported in considerable quantities, besides bitumen, which is obtained from a mine worked by a French company. The imports are woollen and cotton piece-goods, metals, and petroleum.

Avon, the name of several rivers of England, of which the most important are the following:—(1) The LOWER AVON. Rising in the south of Gloucestershire, it describes a big eastward curve through Wiltshire, and enters Somersetshire a few miles S.E. of Bath; from this city it flows W.N.W. through Bristol to the estuary of the Severn, which it enters about 5 miles S. of the Severn Tunnel. The total length is about 70 miles. The chief importance of the river lies in its lower course, especially in the 7 miles below Bristol, though it is navigable for small vessels as far up as Bath, a distance of 12 miles. One of the causes of the decline in the trade of Bristol was the tortuous channel of the Avon between that city and the Severn. Something was done to remedy this in 1809, when a new channel was cut for the river through the city, the river itself converted into a "floating harbour" (3 miles long), and two dock basins dug beside it, covering an area of 85 acres and giving a depth of 22 feet. But owing to the increasing size of ocean-going vessels, this accommodation proved insufficient, and in 1884 the corporation of Bristol bought, as an out-port at the mouth of the Avon, the two docks of AVONMOUTH and PORTISHEAD. The former, situated on the Gloucester side of the Avon, has an area of 19 acres, with a depth on sills of 28 to 38 feet, and is equipped with large granaries, cattle quarters, chill rooms, and provision stores. The dock can be entered at any time by vessels of 2000 tons; and there is anchorage for vessels drawing up to 30 feet at one mile distance from the dock gates. The Portishead dock, which is situated about 3 miles S.W. of the mouth of the Avon, has an area of 12 acres, with a depth on sill of 24 to 34 feet. It is easily entered and cleared in all weathers, being under the shelter

of the Portishead Hills. Both docks are connected with Bristol by rail, and so with the Midland and Great Western railway systems. In February 1901 the Imperial Direct West India Mail Service began running fortnightly vessels between Bristol and Jamaica, carrying passengers, and bringing West Indian fruit (chiefly bananas) to England. This led in March 1902 to the opening of a still larger dock (King Edward VII. Dock) at Avonmouth, designed to accommodate vessels of 20,000 tons, equipped with the newest American machinery for dealing with heavy freight, with colossal grain elevators on the transatlantic model, and with cold storage accommodation of the most scientific description, the estimated cost being two millions sterling. The Avon is noted, like the Severn, for its high tides, the rise generally varying from 24 to nearly 40 feet even at Bristol. (2) The UPPER AVON, nearly 100 miles long, rising in the west of Northamptonshire near Naseby, flowing through Warwickshire and across the southern extremity of Worcestershire, and entering the Severn immediately below Tewkesbury. It is navigable for small craft up to a point about 5 miles above Evesham. (3) The EAST AVON, rising in the middle of Wiltshire, flowing south through Amesbury and Salisbury and along the western border of the New Forest, and eventually entering the English Channel below Christchurch in Dorsetshire. Its length is about 50 miles, and it is not navigable.

Avranches, chief town of arrondissement, department of Manche, France, 34 miles S.W. of St Lô by rail. There are a communal college, botanic gardens, and a library, the last containing valuable manuscripts. The principal church, that of Notre Dame des Champs, has been rebuilt. Trade is now carried on in cider, cattle, butter, flowers, and fruit, and there are salmon and other fisheries. Population (1881), 7677; (1901), 7384.

Awaji, an island belonging to Japan, situated at the eastern entrance of the Inland Sea, having a circumference of 94 miles, an area of 218 square miles, and a population of 188,908. It is celebrated for its exquisite scenery, and also for the fact that it is traditionally reputed to have been the first of the Japanese islands created by the deities Izanagi and Izanami. The loftiest peak is Yuruuba-yama (1998 feet), the most picturesque Sen-zan (1519 feet).

Awellimiden. See SAHARA.

Axim. See GOLD COAST.

Axminster, a market-town and railway station in the Honiton parliamentary division of Devonshire, England, 24 miles E. by N. of Exeter. There are tooth- and nail-brush works and an iron foundry. A cottage hospital has been opened. Area of parish, 6833 acres. Population (1881), 2872; (1901), 2906.

Axum. See ABYSSINIA.

Ayacucho, an interior department of central Peru. It has an area of 18,185 square miles, and its population was officially estimated at 302,469 in 1896. It contains six provinces—Huanta, La Mar, Ayacucho, Cangallo, Lucanas, and Parina-cochas. The capital, Ayacucho, has a population of 20,000.

Ayala y Herrera, Adelardo López de (1828-1879), Spanish writer and politician, was born at Guadalcanal on 1st May 1828, and at a very early age began writing for the theatre of his native town. The titles of these juvenile performances, which were played by amateurs, were "Salga por donde saliere," "Me voy á Sevilla," and "La Corona y el Puñal." As travelling companies never visited Guadalcanal, and as ladies took no part in the representations, these three plays were written for men only. Ayala persuaded his sister to

appear as the heroine of his comedy, "La primera Dama," and the innovation, if it scandalized some of his townsmen, permitted him to develop his talent more freely. In his twentieth year he matriculated at the university of Seville; but it is not certain whether he joined the faculty of law or that of philosophy, and his career as a student was undistinguished. In Seville he made acquaintance with García Gutiérrez, who is reported to have encouraged his dramatic ambitions and to have given him the benefit of his own experience as a playwright. Early in 1850 Ayala removed his name from the university books, and settled in Madrid with the purpose of becoming a professional dramatist. Though he had no friends and no influence, he speedily found an opening. A four-act play in verse, "Un Hombre de Estado," was accepted by the managers of the Teatro Español, was given on 25th January 1851, and proved a very remarkable success. Henceforward Ayala's position and popularity were secure. Within a twelvemonth he became more widely known by his "Castigo y Perdón," and by a more humorous effort, "Los dos Guzmanes"; and shortly afterwards he was appointed by the *Moderado* Government to a post in the Home Office, which he lost in 1854 on the accession to power of the Liberal party. In 1854 he produced "Rioja," perhaps the most admired and the most admirable of all his works, and from 1854 to 1856 he took an active part in the political campaign carried on in the journal *El Padre Cobos*. A *zarzuela*, entitled "Guerra á muerte," for which Emilio Arrieta composed the music, belongs to 1855, and to the same collaboration is due "El Agente de Matrimonios." At about this date Ayala passed over from the Moderate to the Progressive party, and this political manœuvre had its effect upon the fate of his plays. The performances of "Los Comuneros" were attended by members of both political parties; the utterances of the different characters were taken to represent the author's personal opinions, and every speech which could be wrenched into connexion with current politics was applauded by one half of the house and derided by the other half. A *zarzuela*, named "El Conde de Castralla," was given amid much uproar on 20th February 1856, and, as the piece seemed likely to cause serious disorder in the theatre, it was suppressed by the Government after the third performance. Ayala's rupture with the Moderates was now complete, and in 1857, through the interest of O'Donnell, he was elected as Liberal deputy for Badajoz. His political changes are difficult to follow, or to explain, and they have been unsparingly censured. So far as can be judged, Ayala had no strong political views, and drifted with the current of the moment. He took part in the revolution of 1868, wrote the "Manifesto of Cadiz," took office as colonial minister, favoured the candidature of the duc de Montpensier, resigned in 1871, returned to his early Conservative principles, and was a member of Alfonso XII.'s first Cabinet. Meanwhile, however divided in opinion as to his political conduct, his countrymen were practically unanimous in admiring his dramatic work; and his reputation, if it gained little by "El nuevo Don Juan," was greatly increased by "El Tanto por Ciento" and "El Tejado de Vidrio." His last play, "Consuelo," was given on 30th March 1878. Ayala was nominated to the dignified post of president of Congress shortly before his death, which occurred unexpectedly on 30th January 1879. The best of his lyrical work, excellent for finish and intense sincerity, is his "Epístola" to Emilio Arrieta, and, had he chosen to dedicate himself to lyric poetry, he might possibly have ranked with the best of Spain's modern singers; as it is, he is a very considerable poet who affects the dramatic form. In his later writings he deals with modern society, its vices, ideals, and perils; yet in many

essentials he is a manifest disciple of Calderon. He has the familiar Calderonian limitations: the substitution of types for characters, of eloquence for vital dialogue. Nor can he equal the sublime lyricism of his model; but he is little inferior in poetic conception, in dignified idealization, and in picturesque imagery. And it may be fairly claimed for him that in "El Tejado de Vidrio" and "El Tanto por Ciento" he displays a very exceptional combination of satiric intention with romantic inspiration. By these plays, and by "Rioja" and "Consuelo," he is entitled to be judged. They will at least ensure for him an honourable place in the history of the modern Spanish theatre. (J. F.-K.)

Aylesbury, a market town in the Aylesbury parliamentary division (since 1885) of Buckinghamshire, England, 48 miles N.W. of London by rail. Modern erections are a church, a clergy house, two Methodist chapels, a literary institute, a club for working men, and public swimming baths. An improved drainage system has cost £25,000. There are printing works and works for condensing milk, but the manufacture of pillow-lace is almost extinct. Area of parish (an urban district), 3302 acres. Population (1881), 7795; (1901), 9244.

Ayr, a royal and parliamentary burgh (Ayr group) and the county town of Ayrshire, a seaport and manufacturing town, situated at the influx of the Ayr river into the bay of the same name, 40½ miles S.W. by S. of Glasgow by rail. The New Bridge was injured by floods in 1877, and rebuilt in 1879. Another bridge was erected in 1898, and a footbridge in 1900. A town hall and corporation offices, built in 1883, were destroyed by fire in 1897. Recent structures are two Established, Trinity Episcopal (rebuilt), and United Free churches, new railway station, free library, cattle market, post office, and academy (rebuilt). A statue of Burns was erected in 1891. The harbour has been improved at a cost of £153,500. An esplanade leading from the harbour has been made, and another was laid out on the north side in 1898. Vessels on the port register numbered 22 of 3689 tons at the end of 1898, and the traffic, mostly coasting, was: 1898, entered 2467 vessels of 399,233 tons, cleared 2451 vessels of 386,634 tons. Exports were valued at £13,397 in 1888, and £14,536 in 1898; imports at £79,668 in 1888, and £207,495 in 1898. The academy is under the School Board. Population (1881), 20,812; (1901), 28,624.

Ayrshire, a maritime county of S.W. Scotland, bounded on the N. by Renfrewshire, on the N.E. by Renfrew and Lanark shires, on the E. by Lanark and Dumfries shires, on the S.E. by Kircudbrightshire, on the S. by Wigtownshire, and on the W. by the Irish Sea and the Firth of Clyde.

Area and Population.—In 1891 the Renfrewshire portions of the parishes of Beith and Dunlop (543 and 1101 acres respectively) were transferred to the county of Ayr. According to the latest official estimate, the area of the county (foreshore excluded) is 730,947 acres, or 1142 square miles. The population was in 1881, 217,519; in 1891, 226,283, or, on the above area, 226,386, of whom 111,037 were males and 115,349 females; in 1901, 254,436, an increase of 28,050. On the old area, taking land only (722,229 acres, or 1128½ square miles), the number of persons to the square mile in 1891 was 201, and the number of acres to the person 3·2. In the registration county the increase of population between 1881 and 1891 was 4 per cent. Between 1881 and 1891 the excess of births over deaths was 34,250, and the increase of the resident population 8779. The following table gives particulars of births, deaths, and marriages in 1880, 1890, and 1899:—

Year.	Deaths.	Marriages.	Births.	Percentage of Illegitimate Births.
1880	4414	1456	7766	7·8
1890	4241	1670	7299	7·03
1899	4404	1843	7838	5·6

The birth-rate and marriage-rate were above and the death-rate was below those of Scotland. The following table gives the birth-rate, death-rate, and marriage-rate per thousand of the population for a series of years:—

	1880.	1881-90.	1890.	1891-98.	1899.
Birth-rate . .	35·90	34·12	32·32	33·31	33·63
Death-rate . .	20·41	18·70	18·78	18·05	18·94
Marriage-rate .	6·73	6·82	7·39	7·18	7·91

In 1891 there were 1827 Gaelic-speaking persons in the county, of whom 14 spoke Gaelic only, and 154 foreigners. Valuation in 1889-90, £1,059,056; 1899-1900, £1,229,844.

Constitution and Government.—The county returns two members to parliament, who represent North and South Ayrshire respectively. Ayr, the county town (28,624 inhabitants in 1901), and Irvine (9603) are royal burghs and belong to the Ayr group of parliamentary burghs, and Kilmarnock (34,161) is a parliamentary burgh of the Kilmarnock group. Police burghs are: Ardrossan (5933), Cumnock (3087), Darvel (3070), Galston (4876), Girvan (4019), Kilwinning (4439), Largs (3243), Maybole (5892), Newmilns (4466), Saltcoats (8121), Stewarton (2858), Troon (4696). Other towns are: Beith (7523), Catrine (2340), Dalry (5314), Hurlford (5246), Kilbirnie (7207), Muirkirk (5670), Stevenston (6797). Under the county council 32 special water districts have been formed, 26 drainage districts, and 19 lighting and scavenging districts. There are 44 civil parishes, which are divided among the three combinations of Kyle (in the centre), Cunningham (in the N.), and Carrick (in the S.), with poorhouses at Ayr, Irvine, and Maybole; the number of paupers and dependants in September 1899 was 5408. The county forms a sheriffdom, and there are resident sheriffs-substitute at Ayr and Kilmarnock, who sit also at Irvine, Beith, Cumnock, and Girvan.

Education.—Fifty-one school boards manage 149 schools, which had in 1898-99 an average attendance of 37,956, and there are 28 voluntary schools in the county, of which 17 are Roman Catholic and one Episcopal, with an average attendance of 39,000. There are secondary schools at Ayr, Irvine, Kilmarnock, and Beith, and Kilmarnock Dairy School is now a constituent part of the West of Scotland Agricultural College established in 1899. Six other board schools earned grants in 1898 for giving higher education. For the year ending March 1899 the county council expended £5176 on secondary and technical education, including £2317 contributed by the county council and some of the burgh councils from the "residue" grant; contributions were made to the Glasgow and West of Scotland Technical College and the Kilmarnock Dairy School, and the technical classes subsidized at various local centres embraced instruction in agriculture, mining, engineering, plumbing, gardening, and various science and art subjects.

Agriculture.—The fertility of the soil has been enormously developed by high farming. Potato-growing is an important industry; the coast lands supply the early markets of Scotland and the north of England, and the potato acreage actually exceeded that under turnips in 1898. There is a very large production of milk, butter, and cheese. A fair quantity of wheat is grown—about 2000 acres on an average—and the barley acreage is rather less. Oats form the bulk of the corn crop. The following table gives the principal acreages at intervals of five years from 1880:—

Year.	Area under Crops.	Corn Crops.	Green Crops.	Clover.	Permanent Pasture.	Fallow.
1880	317,387	59,061	19,049	99,055	138,510	1712
1885	317,484	57,645	16,439	123,712	119,532	156
1890	319,856	52,493	17,114	138,511	111,184	235
1895	321,902	49,343	17,472	97,986	156,779	172
1899	321,172	49,232	16,503	102,644	152,503	147

The following table gives particulars of the live stock during the same years:—

Year.	Total Horses.	Total Cattle.	Cows or Heifers in Milk or Calf.	Sheep.	Pigs.
1880	8787	88,932	43,558	362,190	12,164
1885	8585	95,095	46,126	335,050	14,566
1890	8931	100,943	49,718	356,385	16,285
1895	9974	98,842	50,373	361,057	16,768
1899	9329	101,885	51,031	386,098	13,920

The percentage of cultivated area was 43·8 in 1898. The acreage under wood in 1895 was 25,725. Farms are, as a rule,

of moderate size. At the date of the last return, 1895, there were 3333 holdings in the county of an average size of 97 acres; 9·93 did not exceed 5 acres; 27·12 were between 5 and 50, and 62·95 were above 50 acres. Farms between 50 and 100 acres numbered 763; between 100 and 300, 1240; between 300 and 500, 83; and above 500, 13. According to the census of 1891 there were 9201 men and 1672 women engaged in pursuits connected with agriculture.

Industries and Trade.—Ayrshire is the principal mining county in Scotland, and has the second largest coalfield. The following table gives particulars of the mineral industry:—

Year.	Coal.		Iron Ore.		Pig Iron.	Fire Clay.	
	Tons.	Value.	Tons.	Value.	Tons.	Tons.	Value.
1890	8,159,727	£1,105,904	446,246	£245,435	240,848	87,175	£18,888
1899	3,809,813	£1,412,620	354,333	£177,166	345,488	113,127	£18,622

In 1890 there were 21 blast furnaces; in 1899, 26 on an average. Of sandstone, 120,268 tons, valued at £31,341, were obtained in 1895, and 151,955, valued at £47,481, in 1899. Of limestone 21,228 tons were raised in 1895, and 14,369 tons in 1899.

Industries have spread throughout the towns generally. There are now large lace curtain factories at Galston, Newmilns, and Darvel; shoemaking is engaged in on an extensive scale at Maybole, and also at Ayr, Kilmaurs, and Kilmarnock; cabinetmaking at Beith, shipbuilding at Troon, Ayr, Irvine, and Fairlie; while calico-printing, bleaching, silk-weaving, bonnet-making, tanning, and freestone-quarrying are all carried on.

The seaports are Girvan, Ayr, Troon, Irvine, Saltcoats, Ardrossan, and Largs. Fishing is carried on from twelve harbours or creeks, which are divided between the two fishery districts of Ballantrae and Greenock, and statistics for the two districts conjointly may most conveniently be given here.

Year.	Boats in Districts.			Value of Gear.	Resident Fishermen and Boys.	Total Value of all Fish.
	No.	Tons.	Value.			
1890	757	2403	£15,770	£13,244	1333	£44,138
1898	787	1698	£29,768	£13,862	1429	£37,138
1899	744	1852	£15,097	£12,810	1304	£38,493

£13,010 of the total value of fish in 1899 was the value of shell-fish only. The number of persons connected with the various branches of the sea fisheries in 1899 in the two districts was 5956. To Ayrshire harbours alone there belonged in 1899, 322 boats of 877 tons; there were 474 fishermen and boys resident in the county, and the value of the fish landed was £14,500.

At the census of 1891 the number of persons engaged in industrial pursuits was 47,252 men and 14,011 women, of whom 2269 men were concerned in the production of machines and implements, 4136 men and 6056 women of textiles, and 18,992 men of minerals. Commerce occupied 7875 men and 326 women. A large number of short railway lines have been built since 1875 by the Caledonian and Glasgow and South-Western Railway Companies, the total new mileage being about 60 miles, and there are about 85 miles under construction by the Glasgow and South-Western Railway Company.

Ayub Khan, Afghan prince, son of Sher Ali, formerly Amir of Afghanistan, and cousin of the Amir Abdurrahman, was born about 1855. During his father's reign little is recorded of him, but after Sher Ali's expulsion from Kabul by the English, and his death in January 1879, Ayub took possession of Herat, and

maintained himself there until June 1881, when he invaded Afghanistan with the view of asserting his claims to the sovereignty, and in particular of gaining possession of Kandahar, still in the occupation of the British. He encountered the British force commanded by General Burrows at Maiwand, on 27th July, and was able to gain one of the very few pitched battles that have been won by Asiatic leaders over an army under European direction. His triumph, however, was short-lived; while he hesitated to assault Kandahar he was attacked by Sir Frederick (afterwards Lord) Roberts, at the close of the latter's memorable march from Kabul, and utterly discomfited, 20th September 1880. He made his way back to Herat, where he remained for some time unmolested. In the summer of 1881 he again invaded Afghanistan, and on the anniversary of the battle of Maiwand obtained a signal victory over Abdurrahman's lieutenants, mainly through the defection of a Durani regiment. Kandahar fell into his hands, but Abdurrahman now took the field in person, totally defeated Ayub, and expelled him from Herat. He took refuge in Persia, and for some time lived quietly in receipt of an allowance from the Persian Government. In 1887 internal troubles in Afghanistan tempted him to make another endeavour to seize the throne. Defeated and driven into exile, he wandered for some time about Persia, and in November gave himself up to the British agent at Meshed. He was sent to India to live as a state prisoner.

Azamgarh or AZIMGARH, a town and district of British India, in the Gorakhpur division of the North-West Provinces. The town is situated on the river Tons, and has a railway station. The population is 19,000; the municipal income in 1897-98 was Rs.13,107; the registered death-rate in 1897 was 39 per thousand. There are two printing-presses. The district of AZAMGARH has an area of 2148 square miles. In 1891 its population was 1,728,625, being 805 persons per square mile. In 1901 it was 1,530,555, showing a decrease of 11 per cent. The land revenue and rates were Rs.17,48,488, the incidence of assessment per acre being R.1:0:7 on the temporarily settled land, and Rs.0:0:4 on the permanently settled; the cultivated area in 1896-97 was 593,067 acres, of which 417,932 were irrigated from wells, &c.; the number of police was 2845; there are 160 vernacular schools with 5724 pupils; the registered death-rate in 1897 was 38·7 per thousand. There are 364 indigo factories, with an out-turn valued at Rs.4,65,000. A branch of the Bengal and North-Western Railway to Azamgarh town was opened in 1898.

Azerbáiján (Azerbaijan, Azerbádegán of mediæval writers, Athropátakan and Atropatene of the ancients), the north-western and most important province of Persia, with an estimated area of 32,000 square miles and a population of about two millions. It is divided into a number of administrative sub-provinces and districts, each with a *hákím*, governor, or *zábít*, sub-governor, under the governor-general, who, under the present dynasty—that of the Kajárs—has been the heir-apparent to the throne of Persia, assisted by a responsible minister appointed by the Shah. The administrative divisions of the province are as follows: Tabriz and environs, Uskúth, Deh Kháregán, Marágha, Miándóáb, Saújbulagh, Suldúz, Urmia, Selmas, Khoi, Maku, Gerger, Merend (Mehrand in ninth edition), Karadagh, Arvanek, Talish, Ardebil, Mishkin, Khalkhal, Hashtrúd, Garmrúd, Afshár, Saín Kaleh, Uján, Saráb (Siral in ninth edition). The revenue of the province derived from land taxation and other maliat is said to amount to about £200,000 per annum in cash and kind, and nearly all of it is expended in the province for the maintenance of the court of the heir-

apparent, salaries and pay to Government officials and troops, pensions, &c. The revenue from customs, most of it remitted to Tehran, was reported to have been £94,000 in 1887 and £90,333 in 1889, and is now about £80,000. The value of the imports and exports exceeded £2,000,000 in 1898. A concession for working some copper ore in the Karadagh district was granted in 1898 to a Russian company.

A-zhe-ho, or ASHEKHE (Manch. *Alchuku*), a town of China, Manchuria, 125 miles N.E. of Kirin, and 30 miles S. of the Sungari. Population, about 30,000.

Azjer. See SAHARA.

Azores, an archipelago of islands belonging to Portugal, and lying in the Atlantic W. of that country, with an area of 922 sq. miles, and a population of 255,594. The vineyards cover about 9450 acres, and produce 972,850 gallons of wine (the greater part in Pico), valued at £89,350. On St Michael tea is grown, the produce being consumed in Lisbon. The fish caught in 1898 were valued at an aggregate of £33,100, the number of fishermen being 5860, and their vessels 1092. In 1897 the ports of the archipelago were entered and cleared by a total of 1062 vessels of 2,052,792 tons; and the imports and exports together were valued at £210,000. The district of Ponta Delgada, embracing the islands St Mary

and St Michael, has a population of 124,000, and manufactures pottery, cottons, spirits, straw hats, and tea. The capital, and also capital of the islands, is Ponta Delgada, in St Michael (population, 16,767). The district of Angra de Heroismo, embracing the islands Terceira, St George, and Graciosa, has a population of about 72,000, and manufactures linen, woollens, cheese, butter, soap, bricks, and tiles. Its capital, Angra (population, 11,012), in Terceira, is an episcopal see. The district of Horta, embracing the islands Fayal, Pico, Flores, and Corvo, with a population of about 58,000, makes baskets, mats, &c., of straw and osiers, and articles of the pith of the fig. Some 7250 acres are annually planted with vines, which yield 496,000 gallons of wine, valued at £42,250. Its capital is Horta (population, 6879), in Fayal. Meteorological stations are situated at Ponta Delgada and Angra de Heroismo.

Azrek, Bahr el. See ABYSSINIA.

Azuay, a province of Ecuador, bounded on the N. by the province of Cañar, on the S. by that of Loja, on the E. by Oriente, and on the W. by the province of the Oro. Its area covers 3870 sq. miles, and the population numbers 132,400. The capital, Cuenca, has about 25,000 inhabitants. Amongst the principal towns are Gualacco (3000), Paute, Jiron, Sigsig. The province is divided into 44 parishes.

Baálbek, ancient *Heliopolis*, altitude 3850 feet, situated on the east side of the fertile valley of the Litáni, not far from the water-parting between that river and the Orontes. The remarkable ruins of the temples are described in the ninth edition of this work. In the centre of the main court of the Great Temple are the remains of a basilica, possibly built by Theodosius, with its apse at the west end. The ruins suffered severely from an earthquake in 1759, and in 1870 it became necessary to support the keystone of the portal of the Temple of the Sun with a wall. In the quarries near the town is a stone 68 feet long and 14 feet high, weighing about 1500 tons, which is still attached to its quarry bed, and was evidently intended for the temple wall. Important excavations have been made in the temple enclosure by Germany.

A good description of the ruins will be found in BAEDER'S *Palestine and Syria*, Leipzig, 1898.

Bábism is the religion founded in Persia in A.D. 1844-45 by Mirzá 'Alí Muhammad of Shíráz, a young Sayyid who was at that time not twenty-five years of age. Before his "manifestation" (*zuhúr*), of which he gives in the Persian *Bayán* a date corresponding to 23rd May 1844, he was a disciple of Sayyid Kázim of Rasht, the leader of the Shaykhís, a sect of extreme Shí'ites characterized by the doctrine (called by them *Rukn-i-rábi*, "the fourth support") that at all times there must exist an intermediary between the twelfth Imám and his faithful followers. This intermediary they called "the perfect Shí'ite," and his prototype is to be found in the four successive *Bábs* or "gates" through whom alone the twelfth Imám, during the period of his "minor occultation" (*Ghaybat-i-sughrá*, A.D. 874-940), held communication with his partisans. It was in this sense, and not, as has been often asserted, in the sense of "Gate of God" or "Gate of Religion," that the title *Báb* was understood and assumed by Mirzá 'Alí Muhammad; but, though still generally thus styled by non-Bábís, he soon assumed the higher title of *Nuqta* ("Point"), and the title *Báb*,

thus left vacant, was conferred on his ardent disciple, Mullá Husayn of Bushrawayh.

The history of the Bábí movement down to the execution of the Báb at Tabriz (8th July 1850) and the great persecution which followed the attempt of three or four Bábís to assassinate the late Shah, Násiru'd-Dín, in the summer of 1852, is best told by Gobineau, and is summarized in vols. iii., xviii., and xxii. of the ninth edition of the *Encyclopædia Britannica*, s.v. "Bábi or Báby," "Persia: Modern History," and "Sunnites and Shí'ites." The Báb was succeeded on his death by Mirzá Yahyá of Núr (at that time only about twenty years of age), who escaped to Baghdad, and, under the title of *Subh-i-Ezel* ("the Morning of Eternity"), became the pontiff of the sect. He lived, however, in great seclusion, leaving the direction of affairs almost entirely in the hands of his elder half-brother (born 12th November 1817), Mirzá Husayn 'Alí, entitled *Bahá'u'lláh* ("the Splendour of God"), who thus gradually became the most conspicuous and most influential member of the sect, though in the *Iqán*, one of the most important polemical works of the Bábís, composed in 1858-59, he still implicitly recognized the supremacy of *Subh-i-Ezel*. In 1863, however, Bahá declared himself to be "He whom God shall manifest" (*Man Yuz-hiruh'u'lláh*, with prophecies of whose advent the works of the Báb are filled), and called on all the Bábís to recognize his claim. The majority responded, but *Subh-i-Ezel* and some of his faithful adherents refused. Since that date the Bábís have been divided into two sects, Ezelís and Bahá'ís, of which the former have steadily lost and the latter gained ground, so that at the present day there are probably from half a million to a million of the latter, and at most only a hundred or two of the former. In 1863 the Bábís were, at the instance of the Persian Government, removed from Baghdad to Constantinople, whence they were shortly afterwards transferred to Adrianople. In 1868 Bahá and his followers were exiled to Acre in Syria, and *Subh-i-Ezel* with his few adherents to Famagusta in Cyprus, where he

still lived in 1901. Bahá died at Acre on 16th May 1892, and was succeeded by his son 'Abbás Efendi, whose claims, however, were contested by another son named Muhammad 'Alí. The followers of the latter do not appear to be numerous, but in Acre itself they are said to have succeeded in retaining the custody of Bahá's tomb. Full particulars of this latest schism are still lacking. During the last five or six years the doctrine of Bahá has been preached with considerable success by a certain Ibráhím Khayru'lláh in the United States, where there are now some 3000 American converts.

The tenets of the older Bábis (now represented by the Ezéls) included, besides a belief in the divine mission of the Báb and the plenary inspiration of all his numerous writings, a denial of the finality of any revelation, and of the resurrection of the body. Great importance was attached to the mystical values of letters and numbers, especially the numbers 18 and 19 ("the number of the unity") and $19^2 = 361$ ("the number of all things"). In general, the Báb's doctrines most closely resembled those of the Isma'ís and Hurúfis. In the hands of Bahá the aims of the sect became much more practical and ethical, and the wilder pantheistic tendencies and metaphysical hair-splittings of the early Bábis almost disappeared. The intelligence, integrity and morality of the present Bábis (whose numbers appear to be rapidly increasing) are high, but their efforts to improve the social position of woman have been much exaggerated. They were in no way concerned (as was at the time falsely alleged) in the assassination of Násiru'd-Dín

Sháh in May 1896. Since the persecution at Yezd in May 1891 they have been comparatively unmolested.

LITERATURE.—The literature of the sect is very voluminous, but mostly in manuscript. The most valuable public collections in Europe are at St Petersburg, London (British Museum), and Paris (Bibliothèque Nationale), where two or three very rare MSS. collected by Gobineau, including the precious history of the Báb's contemporary, Hájí Mirzá Jání of Káshán, are preserved. For the bibliography up to 1889, see vol. ii. pp. 173-211 of the *Traveller's Narrative, written to illustrate the Episode of the Báb*, a Persian work composed by Bahá's son, 'ABBÁS EFENDÍ, edited, translated and annotated by E. G. BROWNE (Cambridge, 1891). More recent works are:—BROWNE. *The New History of the Báb*. Cambridge, 1893; and "Catalogue and Description of the 27 Bábi Manuscripts," *Journal of R. Asiat. Soc.*, July and October 1892.—ANDREAS. *Die Báb's in Persien*. 1896.—BARON VICTOR ROSEN. *Collections Scientifiques de l'Institut des Langues Orientales*, vol. i. (1877), pp. 179-212; vol. iii. (1886), pp. 1-51; vol. vi. (1891), pp. 141-255. "Manuscripts Báby's"; and other important articles in Russian by the same scholar, and by Captain A. G. TOUMANSKY, in the *Zapiski vostochnava otdyeleniya Imperatorskava Russkava Archeologicheskava Obshchestva* (St Petersburg, 1890-1900, vols. iv.-xii.).—Also an excellent edition by TOUMANSKY, with Russian translation, notes and introduction, of the *Kitáb-i-Aqdas* (the most important of Bahá's works), &c. (St. Petersburg, 1899).—Of the works composed in English for the American converts the most important is entitled *Behá'u'lláh (The Glory of God)*, by Ibráhím Khayru'lláh, assisted by Howard MacNutt (Chicago, 1900).

(E. G. B.)

BABYLONIA AND ASSYRIA.

SINCE the publication of the article on BABYLONIA in the ninth edition of the *Encyclopædia Britannica*, excavations in that country have been carried on so actively, while so largely increasing a number of Assyrian students has been engaged in deciphering the thousands of inscribed tablets which have been brought to Europe and America, that the account given of its history and culture requires to be considerably supplemented and revised. Though little has been done towards the excavation of Assyrian sites, Babylonia has been explored by expedition after expedition, and some of the earliest records of civilization have been brought to light. After the death, however, of Mr George Smith at Aleppo in 1876, the first expedition—that sent out by the British Government in 1877-79 under the conduct of Mr Hormuzd Rassam—confined its operations to Assyria. Excavations in the mounds of Balawât (called Imgur-Bel by the Assyrians), 15 miles east of Mosul, resulted in the discovery of a small temple dedicated to the god of dreams by Assur-nazir-pal II. (885 B.C.), and containing a stone coffer or ark, in which were two inscribed tables of alabaster of rectangular shape, as well as of a palace which had been destroyed by the Babylonians, but rebuilt by Shalmaneser II. From the latter came the bronze gates with hammered reliefs which are now in the British Museum. The remains of a palace of Assur-nazir-pal II. at Nimroud (Calah) were also excavated by Mr Rassam, and hundreds of enamelled tiles were disinterred. Two years later (1880-81) Mr Rassam was sent to Babylonia, where he discovered the site of the temple of the Sun-god of Sippara at Abu-Habba, and so fixed the position of the two Sipparas or Sepharvaim. Abu-Habba lies south of Baghdad, midway between the Euphrates and Tigris, on the south side of an ancient canal, on the opposite bank of which was Sippara of the goddess Anunit, now Dêr.

Meanwhile (1877-81) the French consul, de Sarzec, had been excavating at Tello, the ancient Lagas, in Southern Babylonia, and bringing to light monuments of the Sumerian or pre-Semitic age, which included the diorite statues of the High-priest Gudea, now in the Louvre, the stone of which, according to the inscriptions upon them, had been fetched from Magan, the Sinaitic

peninsula. The subsequent excavations of M. de Sarzec in Tello and its neighbourhood have carried the history of the city back to at least 4000 B.C., and a library of more than 30,000 tablets has been found, which were arranged on shelves in the time of Gudea (in 2700 B.C.). In 1886-87 a German expedition under Koldewey explored the cemetery of El-Hibba (immediately to the south of Tello), and for the first time made us accurately acquainted with the burial customs of ancient Babylonia. Another German expedition, on a large scale, has been despatched in 1899 with the object of thoroughly exploring the site of Babylon, the palaces and temples of which still remain for the most part unidentified. Its first result has been the identification of the mound called El-Qasr with the palace of Nebuchadrezzar, and that of Amran with the temple of Bel. But thus far the most important and most systematic work done in Babylonia has been that of the American expedition of the University of Pennsylvania, which has been (since 1889) patiently and scientifically excavating the great temple of El-lil or Bel at Niffer, the ancient Nippur, in Northern Babylonia. Here Mr Haynes has been working winter and summer, steadily removing stratum after stratum of debris and cutting sections in the ruins down to the virgin soil. Midway in the mound is a platform of huge bricks stamped with the names of Sargon of Akkad and his son Naram-Sin (3800 B.C.); and as the debris above them is eleven metres thick, the topmost layer being not later than the Christian era (Hilprecht, *The Babylonian Expedition*, i. 2. p. 23), it is calculated that the debris underneath the pavement, 9.25 metres thick, must represent a period of about 3000 years, more especially as older constructions had to be levelled before the pavement was laid. In the deepest part of the excavations, however, inscribed clay tablets and fragments of stone vases are still found, though the cuneiform characters upon them are of a very archaic type, and sometimes even retain their primitive pictorial forms.

The temple of Nippur was one of the oldest sanctuaries in Babylonia, and one of the two centres from which the early culture of the country radiated. The other centre was Eridu, now represented by Abu-Shahreïn (or Nowâ-

wis), which, though now 130 miles inland, was once the seaport of primeval Chaldaea. As about 46 miles of land have been formed by the silting up of the shore since the foundation of Spasinus Charax (Mohammerah) in the time of Alexander the Great, or about 115 feet a year, the foundation of Eridu must go back to at least 6000 B.C. Babylon seems to have been a colony of Eridu, since its patron-god, Merodach, was a son of Ea of Eridu, while Ur, now Muqayyar, on the western bank of the Euphrates, must have owed its foundation to Nippur, El-lil, the god of Nippur, being accounted the father of the Moon-god of Ur.

The two streams of culture which flowed from Nippur and Eridu afforded a strong contrast. Ea of Eridu was a god of light and beneficence, who employed his divine wisdom in healing the sick and restoring the dead to life. Rising each morning from his palace in the deep, he had given man the arts and sciences, the industries and manners of civilization. El-lil of Nippur, on the contrary, was the lord of the ghost-land, and his gifts to mankind were the spells and incantations which the spirits of good or evil were compelled to obey. But both Ea and El-lil were the gods of the early Sumerian population of Babylonia, who spoke an agglutinative language, and to whom the invention of the cuneiform system of writing, or rather the pictorial hieroglyphs out of which it developed, was due, as well as all the other elements of Babylonian civilization. All the older inscriptions are in the Sumerian language, and the princes of the older epoch all bear Sumerian names. The precise linguistic position of this language is still a matter of dispute. Professor Hommel has advanced strong reasons for believing it to be related to the Turko-Tatar family; Professor de la Couperie and Mr Ball have endeavoured to connect it with Chinese. The present writer has long since given up the belief that it was a primitive form of Ural-Finnic. All that can be said positively about it is that it is an early representative of the agglutinative languages. There were two dialects of it, one spoken in Sumer or Southern Babylonia, and called by the native grammarians "the pure language" (*eme-lakkkha*), the other in Akkad or Northern Babylonia, and termed "the woman's language" (*eme-sal*). The latter was much affected by phonetic decay and the influence of a Semitic population, which was more numerous in Akkad than in Sumer, and its native appellation was probably derived from its being spoken imperfectly by the Semitic wives of Sumerian husbands. At an early period the Sumerians came into contact with Semitic tribes on the Arabian side of the Euphrates, and after their engineering works had regulated the water-supply of Babylonia and rendered it one of the most fertile of agricultural countries Semitic settlers established themselves in it, and, before 3800 B.C. became the predominant population in Akkad or Northern Babylonia. The languages spoken by the two races were naturally affected by the intercourse between them; Sumerian was influenced by Semitic Babylonian, and still more Semitic Babylonian by Sumerian. Indeed, the Semitic Babylonian of literature may be described as a mixed language, though not to the same extent as modern English. It was many centuries, however, before it succeeded in superseding the older language of the country; in fact, it is questionable whether Sumerian did not survive in some of the country districts of Sumer as late as the Greek period, and even under the dynasty of Khammurabi official texts were still published in the two languages, the older language of Sumer taking the first place. Long after the establishment of Semitic supremacy Sumerian continued to be the language of law, and it remained the language of the official religion to the very last.

The alluvial plain of Babylonia, after its reclamation from swamp and jungle, was called by the Sumerians the Edin or "Plain," a word which was borrowed by Semitic Babylonian under the form of Edinnu, the Eden of Gen. ii. 8. A Sumerian hymn describes a magical tree—the tree of life—which "grew in Eridu," in "the centre of the earth," where the god Ea walks in his garden, forbidden to man, and Tammuz dwells beneath its shade, while the Tigris and Euphrates flow on either side. In this description it is difficult not to see a parallel to that of the Biblical Garden of Eden.¹

Hardly any addition has been made to our knowledge of Assyrian chronology, no further copies of the eponym canon having been found since 1889. The first lists of *limmi*, or eponymous archons who gave their names to their years of office, were brought to light by Sir H. Rawlinson (*Athenæum*, 1862). They are twofold in character, one version containing merely a list of the eponyms in their chronological order, while in the other their titles are added as well as the chief event which marked each term of office. They furnish a continuous and accurate chronology from 893 B.C. (or 911, if George Smith was right in the position he assigned to a fragment of one of them) down to 666 B.C., fixed dates being given within this period by the capture of Samaria in 722 B.C. and the solar eclipse of 15th June 763 B.C., which took place in the ninth year of the reign of Assur-dan III.

Babylonian chronology, however, which a few years ago was almost a blank, has now been to a considerable extent recovered. George Smith had already discovered a fragment of what must have been a complete list of the Chaldean dynasties with their respective dates (*Trans. S.B.A.* iii. 2, 1874), and portions had been published of a so-called *Synchronous History of Assyria and Babylonia*, consisting of brief notices of the occasions on which the kings of the two countries had entered into relation, hostile or otherwise, with one another (Sayce, *Records of the Past*, first series, iv. pp. 24-35). In 1880 Mr. Pinches discovered a tablet, which seems to have been a school-boy's exercise, containing a list of the kings of the first two dynasties of Babylon, and in 1884 a chronological list of the dynasties that reigned in Babylonia from the time that Babylon became the capital of the whole kingdom. In the same year "The Babylonian Chronicle" was also discovered by the same scholar. This is a compilation from older records made in the time of Darius, from a Babylonian point of view, and when perfect must have given a very complete synopsis of Babylonian history, with dates and synchronisms. The portions of it thus far known relate to the Kassite dynasty and the conquest of Babylon by the Assyrian king Tiglath-Ninip, in the 13th century B.C., and more especially to the period beginning with the third year of Nabonassar in Babylonia and the accession of Tiglath-pileser III. in Assyria (745 B.C.), and ending with the accession of Samas-sum-yukin (668 B.C.). In Babylonia time was registered, not by eponyms, but by the chief event that distinguished each year of a king's reign, the accession and death of the king being of course noted. At the end of a reign a list of the dates belonging to it was drawn up, and from time to time these were combined into a longer record. In a commercial community, such as Babylonia was from the first, accurate dating was a matter of vital importance; the validity of contracts and other legal documents often depended upon

¹ Kar-Duniyas, once miswritten Gan-Duniyas, has nothing to do with the Garden of Eden. It means "the Wall" or "Fortification of the god Duniyas," and was the name applied to Northern Babylonia, probably after the rise of the Kassite dynasty, from a line of fortifications which defended the frontier, and may be "the Median Wall" mentioned by Xenophon (*Anab.* ii. 4. 12).

it, and it was necessary that there should be easy access to an official chronological record. Among the tablets recently acquired by the British Museum is one which was compiled on the 2nd day of the month Iyyar in the accession year of Ammi-zadok (2190 B.C.), and which contains a complete chronological register of the earlier reigns of the first dynasty of Babylon. Similar tablets which give the chronology of the reigns of Dungi and Bur-Sin II. (of the dynasty of Ur) have been found at Niffer (Sayce, *Proceedings S.B.A.* xxi. 1), while the annals of Sargon of Akkad and of the first three years of his son Naram-Sin (3800 B.C.) have long been known. The events recorded in these latter have been recently verified by the dates found attached to contemporaneous contracts. To these chronological materials must be added the references to past history which occur in later inscriptions. Nabonidos especially, who was more of an antiquary than a politician, and who spent a good deal of his time in excavating for the monuments of his predecessors, has left us valuable notices. Thus he states that Naram-Sin, the son of Sargon, lived 3200 years before himself, and that a Kassite king, Burna-buryas, reigned 700 years after Khammurabi.

In the earliest period of which we have any knowledge Babylonia was divided into several independent states.

Their frontiers were defined by canals and boundary-stones, and the infringement of these frequently led to war. Many of the states were ruled by a *patesi* or high-priest, the god of its chief sanctuary being nominally the ruler, and the human *patesi* his minister. But in course of time many of the high-priests assumed the functions and title of king; while retaining their priestly office they claimed at the same time to be supreme in the state in all secular concerns. The god remained nominally at its head; but even this position was lost to him when Babylonia was unified under Semitic princes, and the earthly king became an incarnate god. It was only at Babylon that Bel-Merodach continued to hold his own and compel the deified kings to acknowledge themselves his sons, who derived from him their right to rule.

When the monumental evidence first becomes distinct we find a kingdom of Kengi or Sumer in the south of Babylonia, and a kingdom of Kis in the north. Kis is represented by El-Hymer, a little to the east of Babylon, and in later ages was known chiefly on account of its temple of Zamama. In its wars with the south Kis was often assisted by another northern kingdom, the reading of the name of which, and consequently its precise situation, are still uncertain. The name has been read as "the land of the Bow," and supposed to represent Haran in Mesopotamia; this, however, was certainly not the case, and the ideograph by which the name is expressed is probably to be identified with that which in later Babylonian denoted Upê or Opis on the Tigris. Dr Scheil would make it Ukh and identify it with the modern Jokha between the Shatt el-Hai and the Shatt el-Nil, but Jokha is more probably the ancient Isin. On a seal cylinder two of the rulers of the place are called kings of Tê. Perhaps the first king of Upê (?) was a certain Lugal-zaggisi, as he gives his father U-kus the title merely of *patesi* or high-priest.¹ He founded the earliest empire in Western Asia of which we know. He not only conquered Kengi, but also claims to have made Erech his capital, and to have

ruled "from the lower sea of the Tigris and Euphrates" or Persian Gulf to the "Upper Sea" or Mediterranean. The long inscription which he caused to be engraved on the hundreds of stone vases dedicated to El-lil of Nippur has been edited and translated by Professor Hilprecht. The predominance of Kengi in the south was succeeded by that of Lagas, now Tello, on the east side of the Shatt el-Hai. Lagas was at one time dependent on Kis, and we hear of Me-salim, king of Kis, overthrowing Us, the high-priest of Upê, in the *edin* or plain of Lagas, which he had invaded.² Lugal-sug-gur was at the time the high-priest of Lagas. Subsequently Lagas recovered its independence, and its high-priests became kings. One of these, Ur-Nina, was the builder of an edifice attached to the temple of Nina, in the ruins of which terra-cotta bas-reliefs of the king and his sons have been found, as well as lions' heads of onyx, which remind us of Egyptian work, and fragments of onyx plates. These were "booty" dedicated to the goddess Bau. The grandson of Ur-Nina, E-ana-gin or E-anna-du, made himself master of the whole of Southern Babylonia, including "the district of Sumer," together with the cities of Erech, Ur, and Larsa (?). He also annexed the kingdom of Kis, and drove the king of Upê from a part of the territory of Lagas which he had occupied. Upê was made tributary, a certain amount of grain being levied upon each person in it, which had to be paid into the treasury of the goddess Nina and the god Ingurisa. The so-called Stela of the Vultures, now in the Louvre, was erected as a monument of the victory. On this various incidents in the war are represented. In one scene the king stands in his chariot, with a curved weapon in his right hand formed of three bars of metal bound together by rings,³ while his kilted followers with helmets on their heads and lances in their hands march behind him. In another a flock of vultures is feeding on the bodies of the fallen enemy; in a third a tumulus is being heaped up over those who had been slain on the side of Lagas. Elsewhere we see the victorious prince beating down a vanquished chief and superintending the execution of other prisoners who are being sacrificed to the gods, while in one curious scene he is striking with his mace a sort of wicker-work cage filled with naked men. In his hand he holds the crest of Lagas and its god, a lion-headed eagle with outstretched wings and supported by two lions which are set heraldically back to back. The sculptures belong to a primitive period of art.

E-anna-du's campaigns extended beyond the confines of Babylonia. He overran a part of Elam, and took the city of Az, on the Persian Gulf. At home he was a great builder. Temples and palaces were repaired or erected at Lagas and elsewhere, the town of Ninâ—which probably gave its name to the later Ninâ or Nineveh—was rebuilt, and canals and reservoirs were dug. He was succeeded by his brother, En-anna-dun, under whom Upê once more became the dominant power. The sanctuaries of Lagas were destroyed and part of its territory was annexed to Upê. As En-anna-dun has the title only of high-priest, and not of king, it is probable that he acknowledged Urlumma of Upê as his suzerain. His son and successor, Entemena, restored the prestige of Lagas. Upê was subdued and a certain Illi appointed to govern it as high-priest. A tripod of hammered silver dedicated by him to his god is now in the Louvre. A frieze of lions devouring ibexes and deer, and incised with great artistic skill, runs round the neck, while

¹ It must be remembered that the readings of these early non-Semitic names are only provisional, as the pronunciation of the ideographs by which they are expressed is uncertain. On palaeographical grounds Lugal-zaggisi has been placed after the two kings of Tê, En-akalli and his son Urlumma, the latter of whom was a contemporary of Entemena of Lagas. Tê may be Tewa, a suburb of Babylon, since a contract tablet speaks of "Tê in Babylon."

² According to Dr Scheil, a monument recently discovered by Mr de Morgan at Susa makes Me-salim the son of Manistusu.

³ As M. Heuzey has noticed, it resembles a weapon carried by the chief of an Asiatic tribe in a tomb of the twelfth dynasty at Beni Hassan (see *Beni-Hassan*, I. Pl. xxviii.; *Egypt Exploration Fund*).

the eagle crest of Lagas adorns the globular part. The vase is a proof of the high degree of excellence to which the goldsmith's art had already attained. A vase of calcite, also dedicated by Entemena, has been found at Nippur.

While the Sumerian princes of Lagas were fighting and building, the Semitic element in Northern Babylonia was growing in numbers and strength. Manistusu, "king of Kis," a long inscription of whom has been discovered by de Morgan on a monument in the ruins of Susa, probably belonged to the Semitic race. He was a contemporary of Uru-duggina, the vassal king of Lagas, in whom M. Heuzey sees one of the successors of Entemena, though Hilprecht would refer him to a much earlier period. Another Semitic ruler of Kis of the same period was Alusarsid (or Uru-mus), who "subdued Elam and Barahse." But the fame of these early establishers of

Sargon of Akkad.

Semitic supremacy was eclipsed by that of Sargon of Akkad and his son Naram-Sin, the founders of an empire which extended from Elam to the Mediterranean and the Sinaitic peninsula. The date of Sargon is placed by Nabonidos at 3800 B.C. He was the son of Itti-Bel, and a legend related how he had been born in concealment and set adrift in an ark of bulrushes on the waters of the Euphrates. Here he had been rescued and brought up by "Akki the husbandman"; but the day arrived at length when his true origin became known, the crown of Babylonia was set upon his head, and he entered upon a career of foreign conquest. Four times he invaded Syria and Palestine, and spent three years in thoroughly subduing the countries of "the west," and in uniting them with Babylonia "into a single empire." Images of himself were erected on the shores of the Mediterranean in token of his victories, and cities and palaces were built at home out of the spoils of the conquered lands. Elam and the northern part of Mesopotamia were also subjugated, and rebellions were put down both in Kazalla and in Babylonia itself. Contract tablets have been found dated in the years of the campaigns against Palestine and Sarlak, king of Gutium or Kurdistan, and copper is mentioned as being brought from Magan or the Sinaitic peninsula.

Sargon's son and successor, Naram-Sin, followed up the successes of his father by marching into Magan, whose king he took captive. He assumed the imperial title of "king of the four zones," and, like his father, was addressed as a "god." He is even called "the god of Agadé" (Akkad), reminding us of the divine honours claimed by the Pharaohs of Egypt, whose territory now adjoined that of Babylonia. A finely-executed bas-relief, representing Naram-Sin, and bearing a striking resemblance to early Egyptian art in many of its features, has been found at Diarbekir. Babylonian art, however, had already attained a high degree of excellence; two seal cylinders of the time of Sargon are among the most beautiful specimens of the gem-cutter's art ever discovered. The empire was bound together by roads, along which there was a regular postal service, and clay seals, which took the place of stamps, are now in the Louvre bearing the names of Sargon and his son. A cadastral survey seems also to have been instituted, and one of the documents relating to it states that a certain Uru-Malik, whose name appears to indicate his Canaanitish origin, was governor of the land of the Amorites, as Syria and Palestine were called by the Babylonians. It is probable that the first collection of astronomical observations and terrestrial omens was made for a library established by Sargon.

Bingani-sar-ali was the son of Naram-Sin, but we do not yet know whether he followed his father on the throne. Another son was high-priest of the city of Tutu, and in the name of his daughter, Lipus-Eaum, a priestess of Sin,

some scholars have seen that of the Hebrew deity Yahveh. The Babylonian god Ea, however, is more likely to be meant. The fall of Sargon's empire seems to have been as sudden as its rise. The seat of supreme power in Babylonia was shifted southwards to Erech, Isin, and Ur. At least three dynasties appear to have reigned at Ur and claimed suzerainty over the other Babylonian states. One of these, under Gungunu, succeeded in transferring the capital of Babylonia from Isin to Ur. It is still uncertain whether Gungunu belonged to the second or third dynasty of Ur; if to the second, among his successors would have been Ur-Gur, a great builder, who built or restored the temples of the Moon-god at Ur, of the Sun-god at Larsa, of Istar at Erech, and of Bel at Nippur. His son and successor was Dungi I., one of whose vassals was Gudea, the *patesi* or high-priest of Lagas (Tello). Gudea was also a great builder, and the materials for his buildings and statues were brought from all parts of Western Asia, cedar wood from the Amanus mountains, quarried stones from Lebanon, copper from Northern Arabia, gold and precious stones from the desert between Palestine and Egypt, dolerite from Magan (the Sinaitic peninsula), and timber from Dilmun in the Persian Gulf. Some of his statues, now in the Louvre, are carved out of Sinaitic dolerite, and on the lap of one of them (statue E) is the plan of his palace, with the scale of measurement attached. Six of the statues bore special names, and offerings were made to them as to the statues of the gods. Gudea claims to have conquered Ansan in Elam, and was succeeded by his son Ur-Ningirsu. His date may be provisionally fixed at 2700 B.C.

The kings of Ur.

The high-priests of Lagas still owned allegiance to Ur, when the last dynasty of Ur was dominant in Babylonia. The dynasty was Semitic, not Sumerian, though one of its kings was Dungi II. He was followed by Bur-Sin II., Gimil-Sin, and Inê-Sin, whose power extended to the Mediterranean, and of whose reigns we possess a large number of contemporaneous monuments in the shape of contracts and similar business documents, as well as chronological tables. After the fall of the dynasty, Babylonia passed under foreign influence. Sumu-abi ("Shem is my father"), from Southern Arabia (or perhaps Canaan), made himself master of Northern Babylonia, while Elamite invaders occupied the south. After a reign of fourteen years Sumu-abi was succeeded by his son Sumu-la-ilu, in the fifth year of whose reign the fortress of Babylon was built, and the city became for the first time a capital. Rival kings, Pungun-ila and Immerum, are mentioned in the contract tablets as reigning at the same time as Sumu-la-ilu (or Samu-la-ilu); and under Sin-muballidh, the great-grandson of Sumu-la-ilu, the Elamites laid the whole of the country under tribute, and made Eri-Aku or Arioch, called Rim-Sin by his Semitic subjects, king of Larsa. Eri-Aku was the son of Kudar-Mabug, who was prince of Yamudbal, on the eastern border of Babylonia, and also "governor of Syria." The Elamite supremacy was at last shaken off by the son and successor of Sin-muballidh, Khammurabi, whose name is also written Ammurapi and Khammuram, and who was the Amraphel of Gen. xiv. 1. The Elamites, under their king Kudur-Lagamar or Chedor-laomer, seem to have taken Babylon and destroyed the temple of Bel-Merodach; but Khammurabi retrieved his fortunes, and in the thirtieth year of his reign (in 2340 B.C.) he overthrew the Elamite forces in a decisive battle and drove them out of Babylonia. The next two years were occupied in adding Larsa and Yamudbal to his dominion, and in forming Babylonia into a single monarchy, the head of which was Babylon. A great literary revival followed the recovery

Accession of a South Arabian dynasty.

Khammurabi or Amraphel.

of Babylonian independence, and the rule of Babylon was obeyed as far as the shores of the Mediterranean. Vast numbers of contract tablets, dated in the reigns of Khammurabi and other kings of the dynasty, have been discovered, as well as autograph letters of the kings themselves, more especially of Khammurabi. Among the latter is one ordering the despatch of 240 soldiers from Assyria and Situllum, a proof that Assyria was at the time a Babylonian dependency. Constant intercourse was kept up between Babylonia and the west, Babylonian officials and troops passing to Syria and Canaan, while "Amorite" colonists were established in Babylonia for the purposes of trade. One of these Amorites, Abi-ramu or Abram by name, is the father of a witness to a deed dated in the reign of Khammurabi's grandfather. Ammi-ditana, the great-grandson of Khammurabi, still entitles himself "king of the land of the Amorites," and both his father and son bear the Canaanitish (and South Arabian) names of Abèsukh or Abishua, and Ammi-zadok.

Samsu-ditana, the son of Ammi-zadok, was the last king of the first dynasty of Babylon, which was followed by a dynasty of eleven Sumerian kings for 368 years. We know but little of them; their capital has not yet been discovered, and no trading documents dated in their reigns have been found. They were overthrown and Babylonia

was conquered by Kassites or Kossæans from the mountains of Elam, under Kandis or Gaddas (in 1800 B.C.), who established a dynasty which lasted for 576 years and nine months. Under this foreign domination, Babylonia lost its empire over Western Asia. Syria and Palestine became independent, and the high-priests of Assur made themselves kings of Assyria. The divine attributes with which the Semitic kings of Babylonia had been invested disappeared at the same time; the title of "god" is never given to a Kassite sovereign. Babylon, however, remained the capital of the kingdom and the holy city of Western Asia. Like the sovereigns of the Holy Roman Empire, it was necessary for the prince, who claimed rule in Western Asia, to go to Babylon and there be acknowledged as the adopted son of Bel before his claim to legitimacy could be admitted. Babylon became more and more a priestly city, living on its ancient prestige and merging its ruler into a pontiff. From henceforth, down to the Persian era, it was the religious head of the civilized east.

One of the earlier Kassite kings was Agum-kakrime, who recovered the images of Merodach and his consort, which had been carried away to Khani. At a later date Kadasman-Bel and Burna-buryas I. corresponded with the Egyptian Pharaohs Amon-hotep III. and Amon-hotep IV. (1400 B.C.). The Assyrian king Assur-yuballidh still owned allegiance to his Babylonian suzerain, and intermarriages took place between the royal families of Assyria and Babylonia. Babylonia, moreover, still sought opportunities of recovering its old supremacy in Palestine, which the conquests of the eighteenth dynasty had made an Egyptian province, and along with Mitanni or Aram-Naharaim and the Hittites intrigued against the Egyptian Government with disaffected conspirators in the west. After the death of Burna-buryas, however, civil war in Babylonia led to Assyrian interference in the affairs of the country, and from this time forward even the nominal obedience of Assyria to its old suzerain was at an end. Frequent wars broke out between the two nations, and eventually (about 1280 B.C.) Tiglath-Ninip of Assyria, in the fifth year of his reign, captured Babylon and sent the treasures of É-Saggil, the temple of Bel-Merodach, to Assur. For seven years the Assyrian monarch reigned over Babylonia, then a revolt obliged him to retire; Hadad-nadin-sumi of the native

dynasty was placed on the Babylonian throne; and Tiglath-Ninip was shortly afterwards murdered by his son, Assurnazir-pal I. Assyria steadily increased in power, while Babylonia fell more and more into decay. Shalmaneser I., the builder of Calah (now Nimroud) in 1300 B.C., carried his victorious arms in all directions, and Tiglath-pileser I. extended the Assyrian empire as far as the Mediterranean (1100 B.C.). The Kassite dynasty had fallen about 1230 B.C., in consequence of an attack on the part of the Elamites, and a new dynasty which sprang from Isin took its place, and lasted for 132½ years. Then came a series of short-lived dynasties, ending with that of Nebo-nazir, the Nabonassar of classical writers, who ascended the throne of Babylon in 747 B.C. Assyria was at the time in the throes of a revolution. Civil war and pestilence were devastating the kingdom, and its northern provinces had been wrested from it by Ararat (or Van). In 746 B.C. Calah rebelled, and on the 13th of Iyyar (April), in the following year, Pulu or Pul, who took the name of Tiglath-pileser III., seized the throne, and inaugurated a new and vigorous policy.

Under him and his successors arose the second Assyrian empire, which finally included the whole civilized world of the day. In 729 B.C. Babylonia was conquered, and the Assyrian king, under his original name of Pulu, was invested with the sovereignty of Asia in the holy city of Babylon. Two years later, in Tebet (or December) 727 B.C., he died, but his successor Ululâ, who took the name of Shalmaneser IV., continued the policy he had begun. Shalmaneser died suddenly in Tebet 722 B.C., and the seizure of the throne by Sargon on the 12th of the month gave the Babylonians an opportunity to revolt. In Nisan (or March) the Kaldâ prince, Merodach-baladan, entered Babylon, and was there crowned legitimate king. For twelve years he successfully resisted the Assyrians; but the failure of his allies in the West to act in concert with him, and the overthrow of the Elamites, eventually compelled him to fly to his ancestral domains in the marshes of Southern Babylonia. Even here his enemies pursued him, and along with his followers he sought refuge in Elam. Sargon was accepted as king by the Babylonian priests, and the legitimacy of his rule was acknowledged up to the time of his murder in 705 B.C. Sennacherib, who followed him as king of Assyria, was never crowned at Babylon, the result being revolt after revolt on the part of the Babylonians, who found supporters in the Elamites. At length (in 691 B.C.) a decisive battle was fought at Khalulê. Both sides claimed the victory, but the Elamites retired from the struggle, and the Babylonians were too exhausted to face their invaders again in the open field. Two years, however, were still required for the complete subjugation of the country, and it was not till 689 B.C. that Babylon was taken, its houses and temples razed to the ground, the images of its gods broken in pieces, and the ruins of the city thrown into the canal Arakhtu. The catastrophe aroused a feeling of horror and indignation throughout Western Asia, and the murder of its perpetrator nine years afterwards was regarded by the Babylonians as the punishment inflicted on him by heaven. The murder took place on the 20th of Tebet (681 B.C.), and for forty-two days the conspirators held the capital; then they were forced to fly to Ararat, against which an Assyrian army, under the command of Esar-haddon, was carrying on hostilities. A battle was fought with the Armenian and rebel Assyrian forces near Malatiyeh on the 12th of Iyyar; the veterans of Assyria won the day, and at the close of it saluted Esar-haddon as king. He thereupon returned to Nineveh, and on the 8th of Sivan (May) formally ascended the throne.

The second Assyrian empire.

Destruction of Babylon.

Assyrian conquest of Babylon.

One of his first acts was to restore Babylon, to send back the image of Bel-Merodach to its old home, and to repeople the city with such of the priests and the former population as had survived massacre. Then he was solemnly declared king in the temple of Bel-Merodach, which had again risen from its ruins, and Babylon became the second capital of the empire. Esar-haddon's policy was successful, and Babylonia remained contentedly quiet throughout his reign. In February (674 B.C.) the Assyrians

entered upon their invasion of Egypt. But two more campaigns were needed before its conquest could be completed. At last in Nisan (or March) 670 B.C., an expedition on an unusually large scale set out from Nineveh. The Egyptian frontier was crossed on the 3rd of Tammuz (June), and Tirhakah, at the head of the Egyptian forces, was driven to Memphis after fifteen days of continuous fighting, during which the Egyptians were thrice defeated with heavy loss and Tirhakah himself was wounded. On the 22nd of the month Memphis was entered by the victorious army, and Tirhakah fled to the south. A stele commemorating the victory and representing Tirhakah with the features of a negro was set up at Sinjirli (north of the Gulf of Antioch), and is now in the Berlin Museum. Two years later (668 B.C.) Egypt revolted, and while on the march to reduce it Esar-haddon fell ill and died (on the 10th of Marchesvan or October). Assur-bani-pal succeeded him as king of Assyria and its empire, while his brother, Samas-sum-yukin, was made viceroy of Babylonia. The arrangement was evidently intended to flatter the Babylonians by giving them once more the semblance of independence. But it failed to work. Samas-sum-yukin became more Babylonian than his subjects; the viceroy claimed to be the successor of the monarchs whose empire had once stretched to the Mediterranean; even the Sumerian language was revived as the official tongue, and a revolt broke out which shook the Assyrian empire to its foundations. After several years of struggle, during which Egypt recovered its independence, Babylon was starved into surrender, and the rebel viceroy and his supporters were put to death. Then followed the contest with Elam, in spite of the efforts of Assur-bani-pal to ward it off. Assyria, however, was aided by civil war in Elam itself; the country was wasted with fire and sword, and its capital Shushan levelled with the ground. But the long struggle left Assyria maimed and exhausted. It had been drained of both wealth and fighting population; the devastated provinces of Elam and Babylonia could yield nothing with which to supply the needs of the imperial exchequer, and it was difficult to find sufficient troops even to garrison the conquered populations. Assyria, therefore, was ill prepared to face the hordes of Scythians—or

Manda, as they were called by the Babylonians—who now began to harass the frontiers. A Scythian invasion.

Scythian power had grown up in the old kingdom of Ellip, to the east of Assyria, where Ekbatana was built by a "Manda" prince; Asia Minor was infested by the Scythian tribe of Kimmerians, and the death of the Scythian leader Dugdammê (the Lygdamis of Strabo, i. 3. 16) was regarded by Assur-bani-pal as a special mark of divine favour. When Assur-bani-pal died, his empire was fast breaking up. Under his successor, Assur-etil-ilani, the Scythians penetrated into Assyria and made their way as far as the borders of Egypt. Calah was burned, though the strong walls of Nineveh protected the relics of the Assyrian army which had taken refuge behind them; and when the raiders had passed on to other fields of booty, a new palace was erected among the ruins of the neighbouring city. But its architectural poverty and small size show that the resources of Assyria were at a low ebb. A contract has been found at Sippara, dated in the fourth year

of Assur-etil-ilani, though it is possible that his rule in Babylonia was disputed by his Rab-shakeh or vizier, Assur-sum-lisir, whose accession year as king of Assyria has been found on a contract from Niffer. The last king of Assyria was probably the brother of Assur-etil-ilani, Sin-sar-iskun, who seems to have been the Sarakos of Berossos. He was still reigning in Babylonia in his seventh year, as a contract dated in that year has been discovered at Erech, and an inscription of his, in which he speaks of restoring the ruined temples and their priests, couples Merodach of Babylon with Assur of Nineveh. Babylonia, however, was again restless. After the overthrow of Samas-sum-yukin, Kandalanu, the Chineladanos of Ptolemy's canon, had been appointed viceroy. His successor was Nabopolassar, between whom and the last king of Assyria war broke out. The Scythian king of Ekbatana, the Kyaxares of the Greeks, came to the help of the Babylonians. Nineveh was captured and destroyed by the Scythian army, along with those cities of Northern Babylonia which had sided with Babylonia, and the Assyrian empire was at an end.

But little addition has been made to our knowledge of the political events that marked the reign of Nebuchadnezzar. Only a small fragment of his annals has been discovered relating to his invasion of Egypt in 567 B.C., and referring to "Phut of the Ionians." Of the reign of the last Babylonian king, Nabonidos, however, and the conquest of Babylonia by Cyrus, we now have a fair amount of information. This is chiefly derived from a chronological tablet containing the annals of Nabonidos, which is supplemented by an inscription of Nabonidos in which he recounts his restoration of the temple of the Moon-god at Harran, as well as by a proclamation of Cyrus issued shortly after his formal recognition as king of Babylonia. It was in the sixth year of Nabonidos (549 B.C.) that Cyrus, "king of Anzan" in Elam, revolted against his suzerain Astyages, king of "the Manda" or Scythians at Ekbatana. The army of Astyages betrayed him to his enemy, and Cyrus established himself at Ekbatana, thus putting an end to the empire of the Scythians, which the Greek writers called that of the Medes, through a confusion of Madâ or "Medes" with Manda. Three years later we find that Cyrus has become king of Persia and is engaged in a campaign in the north of Mesopotamia. Meanwhile Nabonidos has established a camp at Sippara, near the northern frontier of his kingdom, his son—probably the Belshazzar of other inscriptions—being in command of the army. In 538 B.C. Cyrus invaded Babylonia. A battle was fought at Opis in the month of June, in which the Babylonians were defeated, and immediately afterwards Sippara surrendered to the invader. Nabonidos fled to Babylon, whither he was pursued by Gobryas, the governor of Kurdistan, and on the 16th of Tammuz, two days after the capture of Sippara, "the soldiers of Cyrus entered Babylon without fighting." Nabonidos was dragged out of his hiding-place, and Kurdish guards were placed at the gates of the great temple of Bel, where the services continued without intermission. Cyrus did not arrive till the 3rd of Marchesvan (October), Gobryas having acted for him in his absence. Gobryas was now made governor of the province of Babylon, and a few days afterwards the wife or son of Nabonidos—the reading is unfortunately uncertain—died. A public mourning followed, which lasted six days, and Cambyzes accompanied the corpse to the tomb. Cyrus now claimed to be the legitimate successor of the ancient Babylonian kings and the avenger of Bel-Merodach, who was wrathful at the impiety of Nabonidos in removing the images of the local gods from their ancestral shrines to his capital Babylon. Nabonidos, in fact, had excited a strong feeling against himself by

Conquest
of Baby-
lonia by
Cyrus.

attempting to centralize the religion of Babylonia in the temple of Merodach at Babylon, and while he had thus alienated the local priesthoods the military party despised him on account of his antiquarian tastes. He seems to have left the defence of his kingdom to others, occupying himself with the more congenial work of excavating the foundation records of the temples and determining the dates of their builders. The invasion of Babylonia by Cyrus was doubtless facilitated by the existence of a disaffected party in the state, as well as by the presence of foreign exiles like the Jews, who had been planted in the midst of the country. One of the first acts of Cyrus

accordingly was to allow these exiles to return to their own homes, carrying with them the images of their gods and their sacred vessels.

The permission to do so was embodied in a proclamation, in which the conqueror endeavoured to justify his claim to the Babylonian throne. The feeling was still strong that none had a right to rule over Western Asia until he had been consecrated to the office by Bel and his priests; and from henceforth, accordingly, Cyrus assumed the imperial title of "king of Babylon." A year before his death, in 529 B.C., he associated his son Cambyses in the government, making him king of Babylon, while he reserved for himself the fuller title of "king of the (other) provinces" of the empire. It was only when Darius Hystaspis, the representative of the Aryan race and the Zoroastrian religion, had re-conquered the empire of Cyrus, that the old tradition was broken and the claim of Babylon to confer legitimacy on the rulers of Western Asia ceased to be acknowledged. Darius, in fact, entered Babylon as a conqueror; after the murder of the Magian it had recovered its independence under Nidinta-Bel, who took the name of Nebuchadrezzar III., and reigned from October 521 B.C. to August 520 B.C., when the Persians took it by storm. A few years later, probably 514 B.C., Babylon again revolted under the Armenian Arakha; on this occasion, after its capture by the Persians, the walls were partly destroyed. Ê-Sagila, the great temple of Bel, however, still continued to be kept in repair, and to be a centre of Babylonian patriotism, until at last the foundation of Seleucia diverted the population to the new capital of Babylonia, and the ruins of the old city became a quarry for the builders of the new seat of government.¹

¹ The following is a list of the dynasties and kings of Babylonia and Assyria so far as they are known at present:—

The Babylonian Dynasties from cir. 2700 B.C. :—

Second Dynasty of Ur :— *Dynasty of Sisku (?) for 368 years.*

Ur-Gur, cir. 2700 B.C.
Dungi I. (suzerain of Gudea of Lagas).
Kigal-daramas, 50 years.
Â-dara-kalama, 23 years.
Akurduna, 26 years.
Melamma-kurkurra, 8 years.
Ea-ga[mil], 20 years.

Anman, 60 years.
Ki-Nigas, 56 years.
Damki-ilisu, 26 years.
Iskipal, 15 years.
Sussi, 24 years.
Gul-ki[sar], 55 years.

Third Dynasty of Ur :—
Dungi II., more than 51 years.
Bur-Sin II., more than 12 years.
Gimil-Sin, more than 9 years.
Inê-Sin.

Kassite Dynasty of 36 Kings for 576 years 9 months.
1806 B.C.

Gandis, 16 years.
Agum-sipak, 22 years.
Bitilyasi I., 22 years.
Ussi (?), 9 years.
Adu-metas.
Tazzi-gurumas.
Agum-kakrime.

First Dynasty of Babylon.
2460 B.C.

Sumu-abi, 14 years.
Sumu-la-ilu, 36 years.
Zabium, 14 years.
Abil-Sin, 18 years.
Sin-muballidh, 20 years.
Khammurabi, 43 years.
Samsu-iluna, 38 years.
Abesukh, 25 years.
Ammi-ditana, 25 years.
Ammi-zadoq, 21 years.
Samsu-ditana, 31 years.

Kara-indas.
Kadasman - Bel (corresponded with Amon-hotep III. of Egypt, 1480 B.C.).
Kuri-galzu I.
Burna-buryas, his son.
Kuri-galzu II., his son (?).

Babylonian religion and culture emanated from two centres—Nippur, with its temple of El-lil or Bel, in the north; and Eridu, with its cult of Ea, the god of the water, on the shore of the Persian Gulf. *Sources of Babylonian religion.* But the nature of the religious influence exercised by the two cities differed greatly. From Nippur came a belief in the powers of night and darkness, exorcisms

Kara-khardas.	B.C.
Kadasman-kharbe, his son	cir. 920
Nazi-bugas, a usurper.	cir. 900
Kuri-galzu III., son of Kadasman-kharbe, 35 (?) years.	cir. 880
Nazi - Maruttas, his son, 26 years.	cir. 860
Kadasman-Turgu, his son, 17 years.	cir. 830
Kadasman-buryas, 14 years.	cir. 810
Kudur-Bel, 6 years.	Probably two names missing.
Sagarakti-buryas, his son, 13 years.	Nebo - sum - iskun, son of Dakuri. cir. 760
Bitilyasu II., 8 years.	Nabonassar, 14 years . . . 747
Bel-sum-iddin, 1½ years.	Nebo-nadin-suma, his son, 2 years 733
Hadad-sum-iddin, 6 years.	Nebo-sum-yukin, his son, 1 month 12 days . . . 731
Hadad-sum-uzur, 30 years (including the 7 years during which the Assyrian king Tiglath-Ninip occupied Babylon).	End of "the 22nd dynasty."

Dynasty of Sapê.

Yukin-zera or Chinziros, 3 years	B.C. 780
Pulu (Pul or Poros), called Tiglath - pileser III. in Assyria, 2 years	727
Merodach-baladan I., his son, 13 years.	Ululâ, called Shalmaneser IV. in Assyria 725
Zamama-sum-iddin, 1 year.	Merodach - baladan II. the Chaldean 721
Bel-sum-iddin, 3 years.	Sargon of Assyria 709
<i>Dynasty of Isin of 11 kings for 132½ years.</i>	Sennacherib, his son . . . 705
1229 B.C.	Merodach - zakir - sumi, 1 month 702
Merodach 18 years.	Merodach - baladan III., 6 months 702
Nebuchadrezzar I.	Bel-ebus of Babylon . . . 702
Bel-nadin-pal.	Assur - nadin - sumi, son of Sennacherib 700
Merodach-nadin-akhi, 22 years.	Nergal-yusezib 694
Merodach 1½ years.	Musezib-Merodach 693
Hadad-baladan, an usurper.	Sennacherib destroys Babylon 689
Merodach-sapik-zer-mati, 12 years.	Esar-haddon, his son . . . 681
Nabu-nadin, 8 years.	Samas-sum-yukin, his son . . 668

Dynasty of the Sea-coast.

1096 B.C.	Kandalanu (Kineladanos) . . 648
Simbar-sipak, 18 years.	Nabopolassar 626
Ea-mukin-zeri, 5 months.	Nabu - kudur - uzur (Nebuchadrezzar II.) 605
Kassu-nadin-akhi, 3 years.	Amil - Marduk (Evil - Merodach), his son 562
<i>Dynasty of Bit-Bazi.</i>	Nergal - sarra - uzur (Nergal-sharezer) 560
1075 B.C.	Labasi - Marduk, his son, 3 months 556
Ê-Ulmas-sakin-sumi, 17 years.	Nabu-nahid (Nabonidos) . . 556
Ninip-kudur-uzur I., 3 years.	Cyrus conquers Babylon . . 538
Silanim-Sugamuna, 3 months.	Cambyses, his son 529

Dynasty of Elam.

1055 B.C.	Gomates, the Magian, 7 months 521
An Elamite, 6 years.	Nebuchadrezzar III., native king 521
<i>Second Dynasty of Babylon.</i>	Darius, son of Hystaspes . . 520
1049 B.C.	Nebuchadrezzar IV., rebel king 514
Nebo-kin-abli, 36 years.	Darius restored 513
Ninip-kudur-uzur II. (?) 8 months 12 days.	
Probably four names missing.	

Kings of Assyria.

Bel-kap-kapu, "founder of the monarchy."	B.C.
Assur-sum-esir.	Assur-bil-nisi-su cir. 1450
Ninip-tuklat-Assur, his son (contemporary with Kharbe-sipak of Babylonia).	Buzur-Assur 1440
Erba-Hadad.	Assur-nadin-akhe II. 1420
Assur-nadin-akhe I., his son.	Assur-yuballidh, his son . . 1400
	Bel-nirari, his son 1380
	Pudilu (Pedael), his son . . 1360
	Hadad-nirari I., his son . . 1340
	Shalmaneser I., his son (built Calah) 1320
	Tiglath-Ninip I., his son . . 1300

and spells, and a sorcerer-priesthood. From Eridu came, on the contrary, the elements of art and science, and a belief in divine beings who worked for the good of man. Ea was the culture-god of Babylonia, who communicated to his son "Asari, the benefactor of mankind," the various charms whereby diseases could be cured and the dead raised again to life. Asari, whose resemblance to the Egyptian Osiris is striking, was identified with the Semitic Merodach, the patron-god of Babylon, while El-lil of Nippur became "the older Bel" of Semitic faith. In the primitive Sumerian age of Babylonia, however, neither El-lil nor Ea was as yet a god in the Semitic sense of the term. According to Sumerian ideas every object and force in nature had its *zi*, or "spirit," which manifested itself in life and motion. The *zi* was sometimes beneficent, sometimes malignant, but it could be controlled by the incantations and spells which were known to the sorcerer-priests. Gradually real gods emerged from among the multitude of *zis* with which the universe was filled, perhaps as a result of contact with Semitic tribes. Among these gods Ea, the spirit of the water, El-lil, the spirit of the earth and air, and Ana of Erech, the spirit of heaven, occupied a foremost place. Under Semitic influence they finally became a trinity, while other spirits which had also become gods were ranged below them. A state religion grew up in which the Sumerian elements were modified and transformed in accordance with Semitic conceptions, the sorcerer passed into the priest, and an elaborate ritual was compiled. The female divinities fell into the background, with the exception of Istar, originally the evening-star, who managed to preserve her independence; but the other goddesses became merely the pale reflexions of the god, in many cases owing their existence to the exigencies of Semitic grammar, which attached a feminine form to a masculine noun. Thus Anu, the Semitic equivalent of Ana, was provided with his feminine counterpart, Anatu. The systematizing of the state theology occupied many centuries, and included the formation of an astro-theology in which the planets and principal stars were identified with certain deities in the official pantheon. Between this state religion and the religion of the people there was a wide gulf, though a considerable part of the popular superstitions was incorporated by the priests into their theology, and there modified or explained away. Up to the last, however, a sort of organized popular faith, or "black magic," existed by the side of the official theology, tolerated, though hardly recognized, by it. In this the witch and wizard took the place of the priesthood, malevolent demons were adored

instead of the gods of light, and the ritual consisted of spells and incantations addressed to them under the cover of night. The central object of worship was an Istar who differed essentially from the Istar of the official cult, and was little more than a mistress of witchcraft and evil.

Closely connected with the religious cult were the poems and epics in which the ancient myths and stories of the gods were embodied, or attempts were made to explain the origin of the universe. The most famous of these was the *Epic of Gilgames*, in twelve books, composed by a certain Sin-liqi-unninni, and arranged upon an astronomical principle. The eleventh book, corresponding to the zodiacal sign Aquarius, contains the episode of the Deluge. Gilgames is described as the friend and ally of the satyr Ea-bani, who had originally been created to destroy him. Together they overthrow the tyrant Khumbaba, who dwelt within the enchanted cedar forest of Elam, as well as the "divine" bull which Anu had made to avenge the slight put by Gilgames on the goddess Istar. But the destruction of the bull led to the death of Ea-bani and the infliction of a mortal sickness on Gilgames himself. To find a means of cure he determined to make his way to Xisuthros, the hero of the Deluge, who had been translated beyond the river of death. So he travelled through the desert of Mas, or Northern Arabia, to the Twin Mountains behind which the sun sets, and which are guarded by "scorpion-men." Then he plunged into the darkness beyond, and finally emerged on the shore of the ocean which encircles the earth, where a tree grew whose fruit was precious stones. With the help of the boatman, Nis-Ea, Gilgames built a boat, and voyaged for forty-five days until at last the waters of death were reached. There on the islands of the blest he beheld Xisuthros "afar off," and heard from him the story of the Deluge. His disease, moreover, was cured, and a twig of the tree of life was allowed him to carry back to Babylonia. On the way, however, while he stopped to drink of a spring, a serpent came out of the water and stole the precious plant. Gilgames wept in vain. He had to return to his city of Erech without the divine herb and there make lamentation over the dead Ea-bani, whose spirit rose from the earth, like that of Samuel, to tell the hero of the fate that awaited him in the world beyond the grave.

Religious legends.

Another epic was that of the Creation, the object of which was to glorify Bel-Merodach by describing his contest with Tiamat, the dragon of chaos. In the first book an account is given of the creation of the world out of the primeval deep and the birth of the gods of light. Then comes the story of the struggle between the gods of light and the powers of darkness, and the final victory of Merodach, who clove Tiamat asunder, forming the heaven out of one half of her body and the earth out of the other. Merodach next arranged the stars in order, along with the sun and moon, and gave them laws which they were never to transgress. After this the plants and animals were created, and finally man. Merodach here takes the place of Ea, who appears as the creator in the older legends, and is said to have fashioned man out of the clay.

The legend of Adapa, the first man, a portion of which was found in the record-office of the Egyptian king Khun-Aten at Tel el-Amarna, explains the origin of death. Adapa while fishing had broken the wings of the south wind, and was accordingly summoned before the tribunal of Anu in heaven. Ea counselled him not to eat or drink there. He followed the advice, and thus refused the food which would have made him and his descendants immortal.

Among the other legends of Babylonia may be mentioned those of Namtar, the plague-demon, of Urra, the pestilence,

of Etanna, and of Zu. Hades, the abode of Nin-erisgal, or Allat, had been entered by Nergal, who, angered by a message sent to her by the gods of the upper world, ordered Namtar to strike off her head. She, however, declared that she would submit to any conditions imposed on her and would give Nergal the sovereignty of the earth. Nergal accordingly relented, and Allat became the queen of the infernal world. Etanna conspired with the eagle to fly to the highest heaven. The first gate, that of Anu, was successfully reached; but in ascending still farther to the gate of Istar the strength of the eagle gave way, and Etanna was dashed to the ground. As for the storm-god Zu, we are told that he stole the tablets of destiny, and therewith the prerogatives of Bel. God after god was ordered to pursue him and recover them, but it would seem that it was only by a stratagem that they were finally regained.

The contract-tablets have thrown a flood of light on the social life and customs of Babylonia, and have shown that the woman was on a footing of equality with the man. She could carry on business on her own account, could inherit and bequeath property, could hold civil offices, and plead in a court of justice. Polygamy seems to have been rare; and we even hear of a case in which it is stipulated that if the husband marries a second wife the dowry of the first wife shall be returned to her, and she shall be free to go where she chooses. Slaves were protected by law, and they too could acquire property of their own under certain conditions, and appear as witnesses in court. The use of torture for extorting confessions was unknown. The judges, who were appointed by the crown, decided according to the evidence brought before them. There were pleadings and counter-pleadings, and we hear of punishment for perjury. Babylonia was pre-eminently an industrial and commercial state, carrying on commerce with all parts of the known world, and there was therefore a highly elaborate commercial code of law. The decisions of the judges were largely ruled by precedents, which necessitated a careful registration of former verdicts, as well as an accurate system of dating. Education was widespread, and involved a study of the extinct language of Sumer. Women, as well as men, could read and write, and letters passed to and fro between all classes of the community. Mathematics were fairly advanced; eclipses of the sun and moon could be foretold, and the zodiac was a Babylonian invention. There were various holidays, that of the New Year (*Zagmuku*, or *Akitu*) being the most sacred. It was then that Bel entered the Holy of Holies, and seating himself above the mercy-seat (*parakku*) determined the destinies of mankind. There were no castes. Each man was free to follow what profession he chose. The priesthood, however, was divided into many different classes. Among these we may name the *barātu*, *asipūt*, and *zammārū*, or "seers," "prophets," and "singers." The ordinary priests were termed *kālū* (*gallī*) and *sangātū*, the high-priest being *sanga-makḫḫū*. Other classes of priests attended to the *sattukku*, or daily sacrifice, and received the *nindabu* or freewill offering from the worshipper. The sacrifices were bloody (*šibū*) and unbloody, among the latter being the *niqu*, or libation, the *qutrinnu*, or incense-offering, and the *širqu*, or drink-offering. Nor must we forget the *qurbannu*, the *korban* of the Jewish ritual. The temples were supported by the *esrā* or tithe. By the side of the priests there does not appear to have been any privileged class of nobility. As might have been expected in a commercial community, no stigma attached to trade. All members of the state took part in it, and we find even the crown-prince, Belshazzar, acting through his agent as a wool-merchant. Money-lending, however, appears to have been one of the most profitable professions. The

ordinary rate of interest was 20 per cent., paid in monthly instalments; but at Babylon in the time of Nebuchadnezzar it tended to be lower, and there are instances of loans in which it is put at 13½ per cent. Payment was either in kind, or, more usually, in specie, the money consisting of stamped rings or bars of gold, silver, and copper. The standard was the maneh, divided into 60 shekels, the standard maneh which was still in use up to the age of Nabonidos being that which had been originally fixed by Dungi, king of Ur. One of these standard-weights, made of stone and from the mint of Nebuchadnezzar, is now in the British Museum.

The Babylonian cemetery adjoined the city of the living, and was built on the same plan as the latter. It was laid out in streets through which trickled rivulets of "pure" water. Many of the tombs, which were made of crude bricks, were provided with gardens, and there were shelves or altars on which were placed the offerings to the dead. After a burial brushwood was usually heaped round the wall of the tomb, and set on fire, so that the corpse within was partially cremated along with the objects that had been buried with it. As the older tombs decayed a new city of tombs arose above them, the city of the dead thus growing in height in the course of centuries, like the cities of the living. The city and the cemetery of ancient Babylonia are alike marked by a "tel."

Bacau, a town in Rumania, capital of the district of the same name, situated near the river Bistritza. The town, which is of modern growth, owes its commercial importance to the fact of its being the point of convergence of the two great highways, one from Bacau to Gyergyő-Szent-Miklós in Transylvania, *viâ* Piatra and the pass of Tölgyes, the other from Bacau to Kézdi-Vásárhely in Transylvania, *viâ* Onesci, Soosmező, and the pass of Ojtoz. The population in 1895 numbered 16,000; in 1900, 16,187, of whom 7850 were Jews.

Baccarat, a town of France, in the department of Meurthe-et-Moselle, arrondissement of Lunéville, 30 miles S.E. of Nancy; connected with Paris by rail. Its glass-works continue to grow in importance, and now give employment to about 2300 persons. The products include ornamental articles of great variety and beauty. Population (1881), 4902; (1896), 5425; (1901), 7014.

Bacchylides, the only lyric poet of Greece, except Pindar, of whose work we possess large remains, was born at Iulis, in the island of Ceos. His father's name was probably Meidon; his mother was a sister of Simonides, himself a native of Iulis. Eusebius says that Bacchylides "flourished" (ἡκμαζεν) in Ol. 78. 2 (467 B.C.). As the term ἡκμαζεν refers to the physical prime, and was commonly placed at about the fortieth year, we may suppose that Bacchylides was born *circa* 507 B.C., a date

which agrees sufficiently well with the few facts which can be gleaned concerning his life. Among his odes found in 1896 the earliest that can be approximately dated is xiii. (ed. Kenyon), which may belong to 479 or 477 B.C.; the latest is vi., of which the date is fixed by the recently-found fragment of the Olympic register to Ol. 82. 1 (452 B.C.). He would thus have been some thirty-nine years younger than his uncle Simonides, and some fifteen years younger than Pindar.

Elsewhere Eusebius states that Bacchylides "was of repute" (ἐγνώριζτο) in Ol. 87. 2 (431 B.C.); and Georgius Syncellus, using the same word, gives Ol. 88 (428-25 B.C.). The phrase would mean that he was then in the fulness of years and of fame. We have no other evidence; but there is nothing improbable in the supposition that he survived the beginning of the Peloponnesian war.

Bacchylides, like Simonides and Pindar, visited the court of Hieron, who ruled Syracuse from 478 to his death in 467. In his fifth ode (476 B.C.), the word ξένος (v. 11) has been taken to mean that he had already been the guest of the prince; and, as Simonides went to Sicily in or about 477 B.C., that is not unlikely. Ode iii. (468 B.C.) was possibly written at Syracuse, as verses 15 and 16 suggest. He there pays a high compliment to Hieron's taste in poetry (ver. 3 ff.). A scholium on *Pyth.* i. 166 avers that Hieron preferred the odes of Bacchylides to those of Pindar. The Alexandrian scholars interpreted a number of passages in Pindar as hostile allusions to Bacchylides or Simonides. If the scholiasts are right, it would appear that Pindar regarded the younger of the two Cean poets as a jealous rival, who disparaged him to their common patron (schol. *Pyth.* ii. 52 f.), and as one whose poetical skill was due to study rather than to genius (*Ol.* 2. 91-110). In *Olymp.* ii. 96 the dual γαύερον, if it does not refer to the uncle and nephew, remains mysterious; nor does it admit of probable emendation. One would gladly reject this tradition, to which the scholia so frequently refer; yet it would be rash to assume that it rested merely on surmise. The Alexandrians may have possessed evidence on the subject which is now lost. It is tolerably certain that the three poets were visitors at Hieron's court at about the same time: Pindar and Bacchylides wrote odes of the same kind in his honour; and there was a tradition that he preferred the younger poet. There is thus no intrinsic improbability in the hypothesis that Pindar's haughty spirit had suffered, or imagined, some mortification. It is noteworthy that, whereas in 476 and 470 both he and Bacchylides celebrated Hieron's victories, in 468 (the most important occasion of all) Bacchylides alone was commissioned to do so; although in that year Pindar composed an ode (*Olymp.* vi.) for another Syracusan victor at the same festival. Nor is it difficult to conceive that a despot such as Hieron, whose constitutional position was ill-defined, and who was perhaps all the more exigent of deference on that account, may have found the genial Ionian a more agreeable courtier than Pindar, an aristocrat of the Boeoto-Aeolic type, not unmindful of "his fathers the Aegeidae," and rather prone to link the praises of his patron with a lofty intimation of his own claims (see, e.g., *Olymp.* i. *ad fin.*). But, whatever may have been the true bearing of Pindar's occasional innuendoes, it is at any rate pleasant to find that in the extant work of Bacchylides there is not the faintest semblance of hostile allusion to any rival. Nay, one might almost imagine a compliment to Pindar, when, in mentioning Hesiod, he calls him Βουρδὸς ἀνὴρ.

Plutarch (*de Exilio*, p. 605 c) names our poet in a list of writers who, after they had been banished from their native cities, were active and successful in literature. It was Peloponnesus that afforded a new home to the exiled

Bacchylides. The passage gives no clue to date or circumstance; but it implies that Peloponnesus was the region where the poet's genius ripened, and where he did the work which established his fame. This points to a residence of considerable length; and it may be noted that some of the poems illustrate their author's intimate knowledge of Peloponnesus. Thus in Ode ix., for Automedes of Phlius, he draws on the legends connected with the Phliasian river Asopus. In Ode x., starting from the Argive legend of Proetus and Acrisius, he tells how the Arcadian cult of Artemis Ἡμέρα was founded. In one of his dithyrambs (xx.) he treated the legend of Idas (a Messenian hero) and Marpessa in the form of a *hymenaeus* sung by maidens of Sparta.

The Alexandrian scholars, who drew up select lists of the best writers in each kind, included Bacchylides in their "canon" of the nine lyric poets, along with Alcman, Sappho, Alcaeus, Stesichorus, Ibycus, Anacreon, Simonides, and Pindar. The Alexandrian grammarian Didymus (*circa* 30 B.C.) wrote a commentary (*ὑπόμνημα*) on the epinician odes of Bacchylides. Horace, a poet in some respects of kindred genius, was a student of his works, and imitated him (according to Porphyry) in Ode i. 15, where Proteus predicts the destruction of Troy. Quotations from Bacchylides, or references to him, occur in Dionysius of Halicarnassus, Strabo, Plutarch, Stobaeus, Athenaeus, Aulus Gellius, Zenobius, Hephaestion, Clement of Alexandria, and various grammarians or scholiasts. Ammianus Marcellinus (xxv. 4) says that the Emperor Julian enjoyed reading Bacchylides. It is clear, then, that this poet continued to be popular during at least the first four centuries of our era. No inference adverse to his repute can fairly be drawn from the fact that no mention of him occurs in the extant work of any Attic writer. The only definite estimate of him by an ancient critic occurs in the treatise *Περὶ ὑψους*, commonly translated "On the Sublime," but meaning rather, "On the sources of elevation in style"; a work ambiguously ascribed to Cassius Longinus (*circa* A.D. 260), but more probably due to some writer of the first century. In chapter xxxiii. of that treatise, the author asks whether we ought to prefer "greatness" in literature, with some attendant faults, to flawless merit on a lower level, and of course replies in the affirmative. In tragedy, he asks, who would be Ion of Chios rather than Sophocles; or in lyric poetry, Bacchylides rather than Pindar? Yet Bacchylides and Ion are "faultless, with a style of perfect elegance and finish." In short, the essayist regards Bacchylides as a thoroughly finished poet of the second class, who never commits glaring faults, but never reaches the loftier heights.

The first and most general quality of style in Bacchylides is his perfect simplicity and clearness. Where the text is not corrupt, there are few sentences which are not lucid in meaning and simple in structure. This lucidity is partly due, no doubt, to the fact that he seldom attempts imagery of the bolder kind, and never has thoughts of a subtle or complex order. Yet it would be very unjust to regard such clearness as merely a compensatory merit of lyric mediocrity, or to ignore its intimate connexion with the man's native grace of mind, with the artist's feeling for expression, with the poet's delicate skill. How many readers, who could enjoy and appreciate Pindar if he were less difficult, are stopped on the threshold by the aspect of his style, and are fain to save their self-esteem by concluding that he is at once turgid and shallow! A pellucid style must always have been a source of wide, though modest, popularity for Bacchylides. If it be true that Hieron preferred him to Pindar, and that he was a favourite with Julian, those instances suggest the charm which he must always have had for cultivated readers to

whom affairs did not leave much leisure for study, and who rejoiced in a poet with whom they could live on such easy terms.

Another prominent trait in the style of Bacchylides is his love of picturesque detail. This characteristic marks the fragment by which, before the discovery of the new MS., he was best known,—a passage, from one of his paeans, on the blessings of peace (fr. 13, Bergk); and it frequently appears in the odes, especially in the mythical narratives. Greater poets can make an image flash upon the mind, as Pindar sometimes does, by a magic phrase, or by throwing one or two salient points into strong relief. The method of Bacchylides is usually quieter; he paints cabinet pictures. Observation and elegance do more for him than grasp or piercing insight; but his work is often of very high excellence in its own kind. His treatment of simile is only a special phase of this general tendency. It is exemplified by the touches with which he elaborates the simile of the eagle in ode v., and that of the storm-tossed mariners in ode xii. This full development of simile is Homeric in manner, but not Homeric in motive: Homer's aim is vividness; Bacchylides is rather intent on the decorative value of the details themselves. There are occasional flashes of brilliancy in his imagery, when it is lit up by his keen sense of beauty or splendour in external nature. A radiance, "as of fire," streams from the forms of the Nereids (xvi. 103 ff.). An athlete shines out among his fellows like "the bright moon of the mid-month night" among the stars (viii. 27 ff.). The sudden gleam of hope which comes to the Trojans by the withdrawal of Achilles is like a ray of sunshine "from beneath the edge of a storm-cloud" (xii. 105 ff.). The shades of the departed, as seen by Heracles on the banks of the Cocytus, are compared to the countless leaves fluttering in the wind on "the gleaming headlands of Ida" (vv. 65 ff.),—an image not unworthy of Dante or of Milton.

Among the minor features of this poet's style the most remarkable is his use of epithets. A god or goddess nearly always receives some ornamental epithet; sometimes, indeed, two, or even three (*e.g.*, καλυκοστέφανου σεμνῶς . . . Ἀρτεμίδος λευκωλένου, v. 98 f.). Such a trait is in unison with the epic manner, the straightforward narrative, which we find in some of the larger poems (as in v., x., and xvi.). On the other hand, the copious use of such ornament has the disadvantage that it sometimes gives a tinge of conventionality to his work. This impression is somewhat strengthened by the fact that many of the epithets are long compound words, not found elsewhere, and (in some cases at least) probably invented by the poet; words which suggest a deliberate effort to vary the stock repertory.

The poems contained in the new MS. are of two classes: I. *Odes of Victory*; II. *Dithyrambs*. The Ode of Victory, ἐπινίκιον (μέλος) or ἐπίνικος (ῥυθμός), is a form derived from the ῥυθμός, which was properly a song in praise of a deity. Stesichorus (circ. 610 B.C.) seems to have been the first who composed hymns in honour, not of gods, but of heroes; the next step was to write hymns in celebration of victories by living men. This custom arose in the second half of the sixth century B.C., the age in which the games at the four great festivals reached the fulness of their popularity. Simonides (born c. 556 B.C.) was the earliest recorded writer of *epinikia*. His odes of this class are now represented only by a few very small fragments, some twenty lines in all. Two of these fragments, belonging to the description of a chariot-race, warrant the belief that Simonides, in his *epinikia*, differed from Pindar in dwelling more on the incidents of the particular victory. The same characteristic is found in

the *epinikia* of Bacchylides. His fifth ode, and Pindar's first *Olympian*, alike celebrate the victory of the horse Phereñicus; but, while Pindar's reference to the race itself is slight and general (vv. 20-22), Bacchylides describes the running of the winner much more vividly and fully (vv. 37-49).

The MS. contains fourteen *epinikia*, or thirteen if Blass be right in supposing that odes vi. and vii., as numbered by Kenyon in the *editio princeps*, are parts of a single ode (for Lachon of Ceos). Four (or on the view just stated, three) of the odes relate to the Olympian festival; two to the Pythian; three to the Isthmian; three to the Nemean; and one to a Thessalian festival called the Περραία. This comes last. The order in which the MS. arranges the other *epinikia* seems to be casual; at least it does not follow (1) the alphabetical sequence of the victors' names, or of the names of their cities; nor (2) chronological sequence; nor (3) classification by contests; nor (4) classification by festivals—except that the four great festivals precede the *Perraea*. The first ode, celebrating a victory of the Cean Argeios at the Isthmus, may possibly have been placed there for a biographical reason, viz., because the poet treated in it the early legends of his native island.

A mythical narrative, connected in some way with the victor or his city, usually occupies the central part of a Pindaric ode. It serves to lift the poem into an ideal region, and to invest it with more than a local or temporary significance. The method of Bacchylides in this department of the *epinikion* is best illustrated by the myth of Croesus in ode iii., that of Heracles and Meleager in ode v., and that of the Proetides in ode x. Pindar's habit is to select certain moments or scenes of a legend, which he depicts with great force and vividness. Bacchylides, on the other hand, has a gentle flow of simple epic narrative; he relies on the interest of the story as a whole, rather than on his power of presenting situations. Another element, always present in the longer odes of victory, is that which may be called the "gnomic." Here, again, there is a contrast between the two poets. Pindar packs his γνῶμαι, his maxims or moral sentiments, into terse and sometimes obscure epigrams; he utters them in a didactic tone, as of one who can speak with the commanding voice of Delphic wisdom. The moralizing of Bacchylides is rather an utterance of quiet meditation, sometimes recalling the strain of Ionian gnomic elegy.

The *epinikia* of Bacchylides are followed in the MS. by six compositions which the Alexandrians classed under the general name of διθύραμβοι, and which we, too, must be content to describe collectively as *Dithyrambs*. The derivation of διθύραμβος is uncertain: δι may be the root seen in διος (cp. διπόλια), and θύραμβος another form of θρίαμβος, a word by which Cratinus (c. 448 B.C.) denotes some kind of hymn to the wine-god. The "dithyramb," first mentioned by Archilochus (c. 670 B.C.), received a finished and choral form from Arion of Lesbos (c. 600 B.C.). His dithyrambs, produced at Corinth, belonged to the cult of Dionysus, and the members of his chorus (τραγικὸς χορός) personated satyrs. Originally concerned with the birth of the god, the dithyramb came to deal with all his fortunes: then its scope became still larger; it might celebrate, not Dionysus alone, but any god or hero. This last development had taken place before the close of the 6th century B.C. Simonides wrote a dithyramb on Memnon and Tithonus; Pindar, on Orion and on Heracles. Hence the Alexandrian scholars used διθύραμβος in a wide sense, as denoting simply a lyric poem occupied with a mythical narrative. Thus ode xvii. of Bacchylides (relating the voyage of Theseus to Crete), though it was clearly a παιάν for the Delian Apollo, was classed by the Alexandrians among his "dithyrambs"—as appears not only from its place in our MS., but also from the allusion of Servius (on *Aen.* vi. 21). The six dithyrambs of Bacchylides are arranged in (approximately) alphabetical order: Ἀντηγορίδαι, Ἡρακλῆς, Ἡτίθειοι ἢ Θηρεύς, S. II. — 7

Θησεύς, 'Ιώ, 'Ιδας. The principal feature, best exemplified by the first and third, is necessarily epic narrative,—often adorned with touches of picturesque detail, and animated by short speeches in the epic manner.

Several other classes of composition are represented by those fragments of Bacchylides, preserved in ancient literature, which were known before the discovery of the new MS. (1) *ὕμνοι*. Among these we hear of the *ἀποπεμπτικοί*, hymns of pious farewell, speeding some god on his way at the season when he passed from one haunt to another. (2) *παίανες*, represented by the well-known fragment on the blessings of peace. (3) *προσόδια*, choral odes sung during processions to temples. (4) *ὑπορχήματα*, lively dance-songs for religious festivals. (5) *ἑρωτικά*, represented by five fragments of a class akin to *σκόλια*, drinking-songs. Under this head come some lively and humorous verses on the power of wine, imitated by Horace (*C.* iii. 21. 13-20). It may be conjectured that the facile grace and bright fancy of Bacchylides were seen to especial advantage in light compositions of this kind. (6) The elegiacs of Bacchylides are represented by two *ἐπιγράμματα ἀναθηματικά*, each of four lines, in the Palatine Anthology. The first (*Anth.* vi. 313) is an inscription for an offering commemorative of a victory gained by a chorus with a poem written by Bacchylides. The second (*Anth.* vi. 53) is an inscription for a shrine dedicated to Zephyrus. Its authenticity has been questioned, but not disproved.

The papyrus containing the odes of Bacchylides was found in Egypt by natives, and reached the British Museum in the autumn of 1896. It was then in about 200 pieces. By the skill and industry of Mr F. G. Kenyon, the editor of the *editio princeps* (1897), the MS. was reconstructed from these lacerated members. As now arranged, the MS. consists of three sections. (1) The first section contains 22 columns of writing. It breaks off after the 8 opening verses of ode xii. (2) The second section contains columns 23-29. Of these, column 23 is represented only by the last letters of two words. This section comprises what remains of odes xiii. and xiv. It breaks off before the end of xiv., which is the last of the epinikia. (3) The third section comprises columns 30-39. It begins with the mutilated opening verses of ode xv. (*Ἀντηροπιδαι*, the first of the dithyrambs), and breaks off after verse 11 of the last dithyramb, "Ιδας. The number of lines in a column varies from 32 to 36, the usual number being 35, or (though less often) 34.

It is impossible to say how much has been lost between the end of column 29 and the beginning of column 30. Probably, however, ode xiv., if not the last, was nearly the last, of the epinikia. It concerns a festival of a merely local character, the Thessalian *Πιεραία*, and was therefore placed after the thirteen other epinikia, which are connected with the four great festivals. The same lacuna leaves it doubtful whether any collective title was prefixed to the *διθύραμβοι*. After the last column (39) of the MS., a good deal has probably been lost. Bacchylides seems to have written at least three other poems of this class (on Cassandra, Laocoon, and Philoctetes); and these would have come, in alphabetical order, after the last of the extant six (Idas).

The writing of the MS. is a fine uncial. It presents some traits of a distinctly Ptolemaic type, though it lacks some features found in the earlier Ptolemaic MSS. (these of the 3rd or 2nd century B.C.). Among the characteristic forms of letters is the *ϣ*, with a shallow curve on the top of the upright; a form found in MSS. ascribed to the 1st century B.C., and different from the more fully formed upsilon of the Roman period. Another very significant letter is the *Ξ*, written as *̲*, a form which begins to go out after *circa* 50 B.C., giving place to one in which the middle stroke is connected with the other two. From these and other indications it is probable that the MS. is not later than the middle of the first century B.C.

The scribe, though he sometimes corrected his own mistakes, was, on the whole, careless of the sense, as of the metre; he seems to have been a mechanical copyist, excellent in penmanship, but intent only on the letters. The MS. has received corrections or small supplements from at least two different persons. One of them (Kenyon's A²) was contemporary, or nearly so, with the scribe. The other (A³) was considerably later; he wrote a Roman cursive which might belong to the end of the first century A.D., or to the early part of the second. The correctors seem to be generally trustworthy; though, like the scribe, they were inattentive to metre, passing over many metrical faults which could easily have been removed. They appear to have compared their MS. with another, or others; but they sometimes made a bad use of such aid, intruding a false reading where their text had the true one.

Breathings are generally added, especially rough breathings; the form is usually square, but sometimes partially rounded. Accents are added, not to all words, but only, as a rule, to those which might cause doubt or difficulty to the reader. This was the Alexandrian practice, accents being regarded as aids to correct reading, and more liberally used when the dialect was not Attic. In accordance with the older system, the accent is not written

on the last syllable of a word; when the accent falls there, a grave accent is written on the preceding syllable, or on two such syllables (*e.g.*, *βλήχρας*, *πάνθ' ἄλλης*).

As Kenyon observes, no MS. of equal antiquity is so well supplied with accents. The MS. which comes nearest to it in this respect is the Aleman fragment in the Louvre, which is of similar or slightly higher age, belonging perhaps to the early part of the first century A.D.; and in that MS. the comparatively frequent accents were doubtless designed to aid readers unfamiliar with Aleman's Laconian Doric. With regard to other grammatical or metrical signs (*προσώδια*) used in the Bacchylides MS., there is not much that calls for special remark. The punctuation, whether by the scribe or by correctors, is very sparse, and certainly cannot always be regarded as authoritative. The signs denoting the end of a strophe or antistrophe (*paragraphus*), of an epode (*coronis*), or of an ode (*asterisk*), are often omitted by the scribe, and, when employed, are sometimes placed incorrectly, or employed in an irregular manner.

Bache, Francis Edward (1833-1858), English musical composer, was born in Birmingham, 14th September 1833. The pupil of Alfred Mellon for violin, and Sterndale Bennett for composition, he afterwards went to Leipzig in 1853 and studied with Hauptmann and Plaidy. Considering the early age at which he died, his compositions are fairly numerous, and the best, a trio for piano and strings, is still held in high esteem. Two operettas, a piano concerto, and a number of published pianoforte pieces and songs, do little more than show how great was his promise. He died at Birmingham of consumption on the 24th of August 1858. His younger brother, WALTER (1842-1888), was born in Birmingham, 19th June 1842, and followed him to the Leipzig Conservatorium, where he became an excellent pianist. From 1862 to 1865 he studied with Liszt in Rome, and for many years devoted himself to the task of winning popularity for his master's works in England. At his annual concerts in London, nearly all Liszt's larger works were heard for the first time in England, and on the occasion of Liszt's last visit to England, in 1886, he was entertained by Bache at a memorable reception at the Grosvenor Gallery. Walter Bache was professor of the pianoforte at the Royal Academy of Music for some years before his death, and the foundation of the Liszt scholarship at that institution was mainly due to his efforts. He died in London on the 26th of March 1888. An interesting memoir of the two brothers, by Miss Constance Bache, appeared in 1901 under the title *Brother Musicians*. (J. A. F. M.)

Bachian (Dutch, *Batjan*), an island (belonging to the residency of Ternate) in the Molucca Sea, in 0° 13'-0° 55' S. and 127° 22'-128° E. It lies west of the southern peninsula of the island of Halmahera (or Jilolo), and has an area of 2990 square miles. It is the most important island of a group formerly governed by a sultan, but since 1889 by a committee of chiefs under the control of a Dutch *controleur*. Since 1882 the Batjan company has attempted to exploit the island, but unsuccessfully, owing to a deficient knowledge of the soil and its capabilities and a lack of labourers.

Backergunje, or BAKARGANJ, a district of British India, in the Dacca division of Bengal, forming part of the joint delta of the Ganges and the Brahmaputra. The administrative headquarters are at Barisal, which is the only town in the district. Its area is 3649 square miles. In 1891 the population was 2,153,965, giving an average density of 590 persons per square mile. Classified according to religion, Hindus numbered 680,381; Mahomedans, 1,462,712; Buddhists and Jains, 6080; Christians, 4659, including 60 Europeans; "others," 133.

In 1901 the population was 2,291,812, showing an increase of 6 per cent. The land revenue and rates (1897-98) were Rs.18,72,626; boys at school (1896-97) numbered 76,602, being 46.2 per cent. of the male population of school-going age; the registered death-rate (1897) was 42.46 per 1000. The number of police was 648. Backergunje is essentially a deltaic tract, traversed by numerous navigable water channels, which afford almost the only means of communication. By far the most important crop is rice, which is largely exported. Jute, oilseeds, betel-nuts, and coco-nuts are also grown. The only manufacture is pottery. The islands on the sea front are exposed to devastation by cyclonic storm-waves. On account of an epidemic of murders, disarmament has been enforced with good effect.

Backnang, a town of Württemberg, Germany, 19 miles by rail N.E. from Stuttgart, with an interesting church (12th century), and notable tanneries and leather factories, also woollen and cloth mills. Population (1885), 6003; (1895), 7380.

Back's River (*Thlewachodyeth*, or Great Fish), a river in Mackenzie and Keewatin districts, Canada, rising in Sussex lake, a small body of water in 108° 20' W. long. and 64° 25' N. lat., and flowing north-eastward to the Arctic Ocean, passing through several large lake-expansions—Pelly, Garry, and M'Dougal—in its course. It was discovered and explored by Captain (afterwards Sir George) Back in 1834. Its total length is 560 miles.

BACTERIOLOGY.

I. GENERAL.

DURING the last decade of the 19th century enormous strides were made in the study of the ubiquitous and minute organisms known as Schizomycetes (bacteria).

The conviction that Cohn was right in regarding them as plants has gained ground, and is now generally accepted, but evidence has also accumulated to show that the group is a heterogeneous one, and that many forms usually included are not true Schizomycetes at all. That most of the typical bacteria have been derived from Cyanophyceæ, such as *Oscillaria*, *Nostoc*, &c., while *Micrococcus*, *Sarcina*, &c., have their prototypes in Chroococcaceæ, Palmellaceæ, may be regarded as fairly well established, and forms like *Beggiatoa* and *Spirochaeta* have their Algal analogues in *Oscillaria* and *Spirulina*; but difficulties arise in several cases, especially since the flagella have become better known. Thaxter's group of Myxobacteriaceæ, if these turn out to be autonomous, points to alliances with the Myxomycetes, and the existence of ciliated Micrococci together with the formation of endospores—structures not known in the Cyanophyceæ—reminds us of the flagellate Protozoa, e.g., *Monas*, *Chromulina*. Resemblances also exist between the endospores and the spore-formations in the Saccharomycetes, and if *Bacillus inflatus*, *B. ventriculus*, &c., really form more than one spore in the cell, these analogies are strengthened. Schizomycetes such as *Clostridium*, *Plectridium*, &c., where the sporiferous cells enlarge, bear out the same argument, and we must not forget that there are extremely minute "yeasts," easily mistaken for Micrococci, and that yeasts occasionally form only one spore in the cell. Further, *Schizo-saccharomyces* is a genus of "yeasts" which combines the peculiarities of the two groups. Nor must we overlook the possibility that the endospore-formation in non-motile bacteria more than merely resembles the development of azygospores in the conjugatæ, and some Ulothricaceæ, if reduced in size, would resemble them. Meyer regards them as chlamydo-spores, and Klebs as "carospores" or possibly chlamydo-spores similar to the endospores of yeast. The former also looks on the ordinary disjointing bacterial cell as an oidium, and it must be admitted that since Brefeld's discovery of the frequency of minute oidia and chlamydo-spores among the fungi, the probability that some so-called bacteria—and this applies especially to the branching forms accepted by some bacteriologists—are merely reduced fungi is increased. Even the curious one-sided growth of certain species which form sheaths and stalks—e.g., *Bacterium vermiciforme*, *B. pediculatum*—can be matched by Algae such as *Oocardium*, *Hydrurus*, and some Diatoms in this respect; and there are re-

semblances in other directions between *Phragmidothrix* and *Bangia*.

That bacteria have existed from very early periods is clear from their presence in fossils; and although we cannot accept all the conclusions drawn from the imperfect records of the rocks, and may dismiss as absurd the statements that geologically immured forms have been found still living, the researches

Distribution.

FIG. 1.—Preparations showing the various kinds of cilia and their arrangement. A, *Bacillus subtilis* Cohn, and *Spirillum undula* Ehrenb.; B, *Planococcus citreus* (Menge) Migula; C, *Pseudomonas pyocyanea* (Gessard) Migula; D, *P. macrolepis* Migula; E, *P. synocyanea* (Ehrenb.) Migula; F, *Bacillus typhi* Gaffky; G, *B. vulgaris* (Hauser) Migula; H, *Microspira Comma* (Koch) Schroeter; J, K, *Spirillum rubrum* Esmarsch; L, M, *S. undula* (Müller) Ehrenb. (All after Migula.)

of Renault and van Tieghem have shown pretty clearly that large numbers of bacteria existed in Carboniferous and Devonian times, and probably earlier. As regards their distribution in space, little is to be added. Several tropical species, especially the pathogenic forms—e.g., *Vibrio cholerae*, &c.—have been more thoroughly examined, but no geographical distribution of bacteria, in the sense used with

regard to higher plants, can be spoken of. The increasing importance to crowded communities of a knowledge of the bacteriology of sewage, of rivers, soil, dairy farms, &c., has stimulated investigation in several directions, and led to extensions and corrections of previous information on these subjects. It has been found that of the numerous species found in rivers some are nitrifying or de-nitrifying harmless forms, and that pathogenic and other species are apt to degenerate quickly, and even die, a process closely connected with the bactericidal action of light referred to below. That typhoid and other bacilli can be transferred by water is well known, but in clear water even the resistant anthrax bacillus gradually succumbs, and no information of value can be obtained from the mere counting of the colonies developed in cultures from any given water.

The principal recent advances in our knowledge of the *morphology* of bacteria concern the motile organs (cilia), the nature of the cell-contents, the cell-membranes, and the nucleus and spore-formation. The bacterial cell is always clothed by a definite cell-membrane, as was shown by the plasmolysing experiments of Fischer and other observers; but whether this is the same structure as the cell-wall of ordinary plants, or more of the nature of an outer pellicle of the protoplasm, is much disputed. On the one hand it rarely gives clear reactions of cellulose or chitine, but appears to contain nitrogen and has been regarded as proteid in character, while the cilia are traced into it; on the other, it is capable of swelling to relatively enormous dimensions under certain conditions, and is probably always more diffuent at the surface; in some cases dextran and similar carbohydrates are found in the swollen mass. In a few cases, however, e.g., *Sarcina*, *Bacterium xylinum*, *B. tuberculosis*, &c., the cellulose reaction is said to be distinct. Certain forms of iron-bacteria have deposits of oxide of iron (rust) in the membranes. The dense capsules observed in some species on certain media appear to be characteristic (e.g., *Leuconostoc*), but in others they are artificial precipitations. The inflated "involution forms" often found in old cultures of given species appear to be due to changes induced by osmosis.

The improvements in technique, and especially in the methods of fixing and staining devised by Löffler, Fischer, and van Ermengem, have led to important additions to our knowledge of the motile organs of the bacteria, and completely altered our ideas of their frequency and distribution. The principle of all the methods is to fix the living and actively-moving organisms by simple drying in air, and then to add a medium which acts as a mordant and forms a delicate transparent film in which the bodies of the bacteria, with their extended and uninjured cilia, remain imbedded during the further staining operations. The intense heating employed in ordinary fixing operations must be avoided, since it destroys the delicate cilia. After the fixing in the film, which is of tannin and osmic acid, or sulphate of iron, the superfluous fixative is washed off, and the stain—fuchsin, silver nitrate, &c.—is added, and the preparation washed, dried, and mounted, &c., in various ways. Van Ermengem's method, which is very successful in many cases, may be given in detail, in illustration of the care necessary in such preparations.

The bacteria having been carefully dried on the cover-slip, are plunged for from 5 to 30 minutes according to the temperature in a "fixing bath" of 1 vol. 2 per cent. osmic acid, 2 vol. 10-25 per cent. tannin-solution, to which 4-5 drops of acetic acid per 100 c.c. are added, and then carefully washed in water and alcohol. The washed preparation is immersed in a "sensitizing bath" of 0.25-0.50 per cent. silver nitrate solution for a few seconds. From this, without further washing, it is plunged also for a few seconds only into a "reducing bath" of 5 grams gallic acid, 3 grams

tannin, 10 grams sodium acetate per 350 grams distilled water, and again without washing brought back into the "sensitizing bath" until it begins to blacken. It is then thoroughly washed, dried, and mounted in the ordinary way. Much care is needed in the details, but the rich brown to nearly black staining in good preparations shows up the cilia very sharply.

Such methods have brought out the facts that cilia may be present during a short period only in the life of a Schizomycete, and that their numbers may vary according to the medium on which the organism is growing. Nevertheless there is more or less constancy in the type of distribution, &c., of the cilia for each species when growing at its best. The chief results may be summed up as follows: some species, e.g., *B. anthracis*, have no cilia; others have only one flagellum at one pole (*Monotrichous*), e.g., *Bacillus pyocyaneus* (Fig. 1, C, D), or one at each pole; others again have a tuft of several cilia at one pole (*Lophotrichous*), e.g., *B. syn-cyaneus* (Fig. 1, E), or at each pole (*Amphitrichous*) (Fig. 1, J, K, L); and, finally, many actively motile forms have

FIG. 2.—The various phases of germination of spores of *Bacillus ramosus* (Fraenkel), as actually observed in hanging drops under very high powers. A, the spore sown at 11 a.m., as shown at a, had swollen (b) perceptibly by noon, and had germinated by 3.30, as shown at c; in d at 6 p.m., and e at 8.30 p.m.; the resulting filament is segmenting into bacilli as it elongates, and at midnight (f) consisted of twelve such segments. B, C, show similar series of phases in the order of the small letters in each case, and with the times of observation attached. At f and g occurs the breaking up of the filament into rodlets. D, germinating spores in various stages, more highly magnified, and showing the different ways of escape of the filament from the spore-membrane. (Original.)

the cilia springing all round (*Peritrichous*), e.g., *B. vulgaris* (Fig. 1, G). It is found, however, that strict reliance cannot be placed on the distinction between the *Monotrichous*, *Lophotrichous*, and *Amphitrichous* conditions, since one and the same species may have one, two, or more cilia at one or both poles; nevertheless some stress may usually be laid on the existence of one or two as opposed to several—e.g., five or six or more—at one or each pole.

In spite of their minuteness several cell-contents have been observed, such as sulphur-granules (Cohn), oil or fat-drops (Meyer), and carbohydrates which turn blue (granulose) or red-brown (glycogen or anylo-dextrin) with iodine (Meyer). A red pigment appears in *Chromatium*, *Thiocystis*, &c. The meaning of the so-called chromatin granules observed in many forms, and their possible relations to nuclear substance, have given rise to much discussion. Klebs, Bütschli, and others have regarded the whole of the protoplasmic contents of a bacterium as equivalent to a nucleus, but Meyer's and Wager's preparations suggest that here as in

other vegetable cells nuclei, or at least nuclear substance in the form of chromatic bodies, exist, though they are extremely minute; Fischer doubts their being true nuclei, but Migula accepts the view that they represent them in a rudimentary form.

With regard to the essential details in the process of spore-formation and germination, resistance to physical

reagents, &c., little advance in knowledge was made in the decade 1890-1900. De Bary's conception of arthrospores, as contrasted with endospores, has been found of little value; an arthrospore is merely an isolated bacterial cell in a resting state, and such occur in endosporous forms, e.g., *B. subtilis*, as well as in species not known to form endospores. In a few cases, e.g., *B. Zopfii*, arthrospores appear to be well formed, but even in this typical case it is evident that we must regard these resting vegetative cells as in the same category as the oidia or gemmæ of true fungi, and in no way morphologically specialized as spores. Similar objections have

FIG. 3.—Stages in the development of spores of *Bacillus ramosus* (Fraenkel), in the order and at the times given, in a hanging drop culture, under a very high power. The process begins with the formation of brilliant granules (A, B); these increase, and the brilliant substance gradually balls together (C) and forms the spores (D), one in each segment, which soon acquire a membrane and ripen (E). (Original.)

been made to the use of the term arthrospore in the case of *Leuconostoc*, where true endospores appear to be formed. In short, the "arthrospore" is nothing more than any ordinary vegetative cell which separates and passes into a condition of rest—just as do the cells of yeast and the encysted cells of many micro-organisms—and according to the older definition every cell of a *Micrococcus* would be an "arthrospore." The so-called arthrospores of *Cladothrix* and other chlamydo-bacteriaceæ are ciliated motile cells, comparable with the zoospores of Algae, and germinating forthwith to new filaments.

The conditions for spore-formation differ. Anaerobic species usually require little oxygen, but aerobic species a free supply. Each species has an optimum temperature, and many are known to require very special food-media. The systematic interference with these conditions has enabled bacteriologists to induce the development of so-called asporogenous races, in which the formation of spores is indefinitely postponed, changes in vigour, virulence, and other properties being also involved, in some cases at any rate. The addition of minute traces of acids, poisons, &c., leads to this change in some forms; high

temperatures have also been used successfully. Most spores are ellipsoid, but those of *B. tetani* are spherical, and those of *B. leptosporus* elongated. The spore may be small and cause no deformation of the mother-cell, in which it lies at one end or in the middle; or it may during formation bring about a swelling of the cell or part of it, so that the mature sporogenous cell is drum-stick-shaped (*Plectridium*) as in *B. tetani*, or fusiform (*Clostridium*) as in *C. butyricum*, &c. Only in rare cases are two spores formed in the rod, e.g., *B. inflatus*. Much careful work has been done on the details of the formation, structure, and germination of spores, but little has been added to what has long been known, viz., that the spore results from aggregation of the protoplasmic contents of the rod (Fig. 3), that no definite nucleus can be made clear, that the spore-wall—probably of some altered protoplasmic product—is thin and extremely resistant when ripe, and that germination is preceded by the rupture or dissolution of the latter at the ends or equator, where it is apparently thinner, the contents growing out as the first rodlet (Fig. 2).

Numerous attempts have been made to construct schemes of classification based on the power of growing colonies to liquefy gelatine, to secrete coloured pigments, to ferment certain media with evolution of carbon-dioxide or other gases, or to induce pathological conditions in animals. None of these systems, which are chiefly due to the medical bacteriologists, has maintained its position, owing to the difficulty of applying the characters and to the fact that such properties are physiological and liable to great fluctuations in culture, because a given organism may vary greatly in such respects according to its degree of vitality at the time, its age, the mode of nutrition, and the influence of external factors on its growth. Even when used in conjunction with purely morphological characters, these physiological properties are too variable to aid us in the discrimination of species and genera, and are apt to break down at critical periods. Among the more characteristic of these schemes adopted at various times may be mentioned those of Miquel (1891), Eisenberg (1891), and Lehmann and Neumann (1897). Although much progress was made during the decade 1890 to 1900 in determining the value and constancy of morphological characters, we are still in need of a sufficiently comprehensive and easily applied scheme of classification, partly owing to the existence in the literature of imperfectly described forms, the life-history of which is not yet known, or the microscopic characters of which have not been examined with sufficient accuracy and thoroughness. The principal attempts at morphological classifications recently brought forward are those of de Toni and Trevisan (1889), Fischer (1897), and Migula (1897). Of these systems, which alone are available in any practicable scheme of classification, the two most important and most modern are those of Fischer and Migula. The extended investigations of the former on the number and distribution of cilia (Fig. 1) led him to propose a scheme of classification based on these and other morphological characters, and differing essentially from any preceding one. This scheme may be tabulated as follows:—

I. ORDER—**Haplobacterinæ**. Vegetative body unicellular; spheroidal, cylindrical, or spirally twisted; isolated or connected in filamentous or other growth series.

1. *Family*—**COCCACEÆ**. Vegetative cells spheroidal.

(a) Sub-family—**ALLOCOCCACEÆ**. Division in all or any planes, colonies indefinite in shape and size, of cells in short chains, irregular clumps, pairs, or isolated:—*Micrococcus* (Cohn), cells non-motile; *Planococcus* (Migula), cells motile.

(b) Sub-family—**HOMOCOCCACEÆ**. Division planes regular and definite:—*Sarcina* (Goods.), cells non-motile; growth and division in three successive planes at right angles, resulting in packet-like groups; *Planosarcina* (Migula), as before, but motile; *Pediococcus* (Lindner), division planes at right angles in two successive planes, and cells in tablets of four or more; *Streptococcus* (Billr.), divisions in one plane only, resulting in chains of cells.

2. **Family—BACILLACEÆ**. Vegetative cells cylindric (rodlets), ellipsoid or ovoid, and straight. Division planes always perpendicular to the long axis.

(a) Sub-family—**BACILLÆ**. Sporogenous rodlets cylindric, not altered in shape:—*Bacillus* (Cohn), non-motile; *Bactrinium* (Fischer), motile, with one polar flagellum (*Monotrichous*); *Bactrillum* (Fischer), motile, with a terminal tuft of cilia (*Lophotrichous*); *Bactridium* (Fischer), motile, with cilia all over the surface (*Peritrichous*).

(b) Sub-family—**CLOSTRIDIÆ**. Sporogenous rodlets, spindle-shaped:—*Clostridium* (Prazm.), motile, peritrichous.

(c) Sub-family—**PLECTRIDÆ**. Sporogenous rodlets, drum-stick-shaped:—*Plectridium* (Fischer), motile, peritrichous.

3. **Family—SPIRILLACEÆ**. Vegetative cells cylindric, but curved more or less spirally. Divisions perpendicular to the long axis:—*Vibrio* (Müller-Löffler), comma-shaped, motile, monotrichous; *Spirillum* (Ehrenb.), more strongly curved in open spirals, motile, lophotrichous; *Spirochaete* (Ehrenb.), spirally coiled in numerous close turns, motile, but apparently owing to flexile movements, as no cilia are found.

II. **ORDER—Trichobacterinæ**. Vegetative body of branched or unbranched cell-filaments, the segments of which separate as swarm-cells (*Gonidia*).

1. **Family—TRICHOBACTERIACEÆ**. Characters those of the Order.

(a) Filaments rigid, non-motile, sheathed:—*Crenothrix* (Cohn), filaments unbranched and devoid of sulphur particles; *Thiothrix* (Winogr.), as before, but with sulphur particles; *Cladothrix* (Cohn), filaments branched in a pseudo-dichotomous manner.

(β) Filaments showing slow pendulous and creeping movements, and with no distinct sheath:—*Beggiatoa* (Trev.), with sulphur particles.

The principal objections to this system are the following:—(1) The extraordinary difficulty in obtaining satisfactory preparations showing the cilia, and the discovery that these motile organs are not formed on all substrata, or are only developed during short periods of activity while the organism is young and vigorous, render this character almost nugatory. For instance, *B. megatherium* and *B. subtilis* pass in a few hours after commencement of growth from a motile stage with peritrichous cilia, into one of filamentous growth preceded by casting of the cilia. (2) By far the majority of the described species (over 1000) fall into the three genera—*Micrococcus* (about 400), *Bacillus* (about 200), and *Bactridium* (about 150), so that only a quarter or so of the forms are selected out by the other genera. (3) The monotrichous and lophotrichous conditions are by no means constant even in the motile stage; thus *Pseudomonas rosea* (Mig.) may have 1, 2, or 3 cilia at either end, and would be distributed by Fischer's classification between *Bactrinium* and *Bactrillum*, according to which state was observed. In Migula's scheme the attempt is made to avoid some of these difficulties, but others are introduced by his otherwise clever devices for dealing with these puzzling little organisms.

The question, What is an individual? has given rise to much difficulty, and around it many of the speculations regarding pleomorphism have centred without useful result. If a tree fell apart into its constituent cells periodically we should have the same difficulty on a larger and more complex scale. The fact that every bacterial cell in a species in most cases appears equally capable of performing all the physiological functions of the species has led

most authorities, however, to regard it as the individual—a view which cannot be consistent in those cases where a simple or branched filamentous series exhibits differences between free apex and fixed base and so forth. It may be doubted whether the discussion is profitable, though it appears necessary in some cases—e.g., concerning pleomorphism—to adopt some definition of individual.

Myxobacteriaceæ.—In 1857 Berkeley figured a curious organism then named *Chondromyces*, and in 1892 this and a number of allied organisms were rediscovered by Thaxter, who showed that they form plasmodium-like aggregations and build themselves up into sporogenous structures quite similar in general features to the cysts of Myxomycetes, except that the plasmodium is filled with—or, according to Thaxter, consists of—swarming bacteria. Several genera and species are described, and if the author's appreciation of the facts is correct, we have here a remarkable group of organisms partaking of the nature of both Schizomycetes and Myxomycetes as his name implies. Until the details of the life-history are better worked out it is, however, impossible to say whether his views are right, or whether we have here—as seems to the present writer to be the case from the only example he has been able to examine—a case of symbiosis, or possibly parasitism, between true Schizomycetes and Myxomycetes.

The discoveries that some species of nitrifying bacteria and pigmented forms are capable of carbon-assimilation, that others can fix free nitrogen, and that a number of decompositions hitherto unsuspected **Functions and life of bacteria.** are accomplished by Schizomycetes, have put the questions of nutrition and fermentation in quite new lights. Apart from numerous fermentation

FIG. 4.—A series of phases of germination of the spore of *B. ramosus* sown at 8.30 (to the extreme left), showing how the growth can be measured. If we place the base of the filament in each case on a base line in the order of the successive times of observation recorded, and at distances apart proportional to the intervals of time (8.30, 10.0, 10.30, 10.40, and so on) and erect the straightened-out filaments, the proportional length of each of which is here given for each period, a line joining the tips of the filaments gives the curve of growth. Cf. Fig. 5. (Original.)

processes such as rotting, the soaking of skins for tanning, the preparation of indigo and of tobacco, hay, ensilage, &c., in all of which bacterial fermentations are concerned, attention may be especially directed to the following evidence of the supreme importance of Schizomycetes in agriculture and daily life. Indeed, nothing marks the attitude of modern bacteriology more clearly than the increasing attention which is being paid to useful fermentations. The vast majority of these organisms are not pathogenic, most are harmless, and many are indispensable aids in natural operations important to man.

Fischer has proposed that the old division into sapro-

phytes and parasites should be replaced by one which takes into account other peculiarities in the mode of nutrition of bacteria. The nitrifying, nitrogen-fixing, sulphur- and iron-bacteria he regards as monotrophic, *i.e.*, as able to carry on one particular series of fermentations or decompositions only, and since they require no organic food materials, or at least are able to work up nitrogen or carbon from inorganic sources, he regards them as primitive forms in this respect, and terms them *Prototrophic*. They may be looked upon as the nearest existing representatives of the primary forms of life which first obtained the power of working up non-living into living materials, and as playing a correspondingly important rôle in the evolution of life on our globe. The vast majority of bacteria, on the other hand, which are ordinarily termed saprophytes, are *saprogenic*, *i.e.*, bring organic material to the putrefactive state—or *saprophilous*, *i.e.*, live best in such putrefying materials—or become *zymogenic*, *i.e.*, their metabolic products may induce blood-poisoning or other toxic effects (facultative parasites) though they are not true parasites. These forms are termed by Fischer *Metatrophic*, because they require various kinds of organic materials obtained from the dead remains of other organisms or from the surfaces of their bodies, and can utilize and decompose them in various ways (*Polytrophic*), or, if monotrophic, are at least unable to work them up. The true parasites—obligate parasites of de Bary—are placed by Fischer in a third biological group, *Paratrophic* bacteria, to mark the importance of their mode of life in the interior of living organisms where they live and multiply in the blood, juices, or tissues.

The growth of an ordinary bacterium consists in uniform elongation of the rodlet until its length is doubled, followed by division by a median septum, then by the simultaneous doubling in length of each daughter cell, again followed by median division, and so on (Figs. 4, 6). If the cells remain connected the resulting filament repeats these processes of elongation and subsequent division uniformly so long as the conditions are maintained, and very accurate measurements have been obtained on such a form, *e.g.*, *B. ramosus*. If a rodlet in a hanging drop of nutrient gelatine is fixed under the microscope and kept at constant temperature, a curve of growth can be obtained recording the behaviour during many hours or days. The measured lengths are marked off on ordinates erected on an abscissa, along which the times are noted. The curve obtained on joining the former points then brings out a number of facts, foremost among which are (1) that as long as the conditions remain constant the doubling periods—*i.e.*, the times taken by any portion of the filament to double its length—are constant, because each cell is equally active along the whole length; (2) there are optimum, minimum, and maximum temperatures, other conditions remaining constant, at which growth begins, runs at its best, and is soon exhausted, respectively; (3) that the most rapid cell-division and maximum growth do not necessarily accord with the best conditions for the life of the organism; and (4) that any sudden alteration of temperature brings about a check, though a slow rise may accelerate growth (Fig. 5). It was also shown that exposure to light, dilution or exhaustion of the food-media, the presence of traces of poisons or metabolic products check growth, or even bring it to a standstill; and the death or injury of any single cell in the filamentous series shows its effect on the curve by lengthening the doubling period, because its potential progeny have been put out of play. Hardy has shown that such a destruction of part of the filament may be effected by the attacks of another organism.

Among the most important advances in our know-

ledge of the bacteria are those having reference to the circulation of nitrogen on the globe. When we reflect that some hundreds of thousands of tons of urea are daily deposited, which ordinary plants are unable to assimilate until considerable changes have been undergone, the question is of importance, What happens in the meantime? In effect the urea first becomes carbonate of ammonia by a simple hydrolysis brought about by bacteria, more and more definitely known since Pasteur, van Tieghem, and Cohn first described them. Lea and Miquel further proved that the hydrolysis is due to an enzyme—urase—separable with difficulty from the bacteria concerned. Many forms in

Nitrogen bacteria.

FIG. 5.—Curve of growth of a filament of *Bacillus ramosus* (Fraenkel), constructed from data such as in Fig. 4. The abscissa represent intervals of time, the ordinates the measured lengths of the growing filament. Thus, at 2.33 p.m. the length of the filament was 6 μ; at 5.45, 20 μ; at 8 p.m., 70 μ, and so on. Such curves show differences of steepness according to the temperature (see temp. curve), and to alterations of light (lamp) and darkness. (Original.)

rivers, soil, manure heaps, &c., are capable of bringing about this change to ammonium carbonate, and much of the loss of volatile ammonia on farms is preventible if the facts are apprehended. The excreta of urea alone thus afford to the soil enormous stores of nitrogen combined in a form which can be rendered available by bacteria, and there are in addition the supplies brought down in rain from the atmosphere, and those due to other living debris. The researches of the decade 1890-1900 demonstrated that a still more inexhaustible supply of nitrogen is made available by the nitrogen-fixing bacteria of the soil. There are in all cultivated soils forms of bacteria which are capable of forcing the inert free nitrogen to combine with other elements into compounds assimilable by plants. This was long asserted as probable before Winogradsky showed that the conclusions of Berthelot, Laurent, and others are right, and that *Clostridium pasteurianum*, for

instance, if protected from access of free oxygen by an envelope of aerobic bacteria or fungi, and provided with the carbohydrates and minerals necessary for its growth, fixes nitrogen in proportion to the amount of sugar consumed. This interesting case of symbiosis is equalled by yet another case. The work of recent observers leaves no room for doubt that the free nitrogen of the atmosphere is brought into combination in the soil in the nodules filled with "bacteroids" on the roots of Leguminosae, and since these nodules are the morphological expression of a symbiosis between the higher plant and the bacteria-like "bacteroids," there is evidently here also a case similar to the last, though it is as yet impossible to say where and how the nitrogen is fixed.

As regards the ammonium carbonate accumulating in the soil from the conversion of urea and other sources, we know from Winogradsky's researches that it undergoes oxidation in two stages owing to the activity of the so-called "nitrifying" bacteria (an unfortunate term inasmuch as "nitrification" refers merely to a particular phase of the cycle of changes undergone by nitrogen). It had long been known that under certain conditions large

FIG. 6.—Stages in the formation of a colony of a variety of *Bacillus* (*Proteus*) *vulgaris* (Hauser), observed in a hanging drop. At 11 A.M. a rodlet appeared (A); at 4 P.M. it had grown and divided and broken up into eight rodlets (B); C shows further development at 8 P.M., D at 9.30 P.M.—all under a high power. At E, F, and G further stages are drawn, as seen under much lower power. (Original.)

quantities of nitrate (saltpetre) are formed on exposed heaps of manure, &c., and it was supposed that direct oxidation of the ammonia, facilitated by the presence of porous bodies, brought this to pass. But research showed that this process of nitrification is dependent on temperature, aeration, and moisture, as is life, and that while nitre-beds can infect one another, the process is stopped by sterilization. Warington, Schloesing, Müntz, and others had proved that nitrification was promoted by some organism, when Winogradsky hit on the happy idea of isolating the organism by using gelatinous silica, and so avoiding the difficulties which Warington had shown to exist with the organism in presence of organic nitrogen, owing to its refusal to nitrify on gelatine or other nitrogenous media. Winogradsky's investigations resulted in the discovery that two kinds of bacteria are concerned in nitrification: one of these, which he terms the *Nitrosobacteria*, is only capable of bringing about the oxidation of the ammonia to nitrous acid, and the astonishing result was obtained that this can be done, in the dark, by bacteria to which only pure mineral salts—e.g., carbonates, sulphates, and chlorides of ammonium, sodium, and magnesium—were added. In other words these bacteria can build up organic matter from purely mineral sources by assimilating carbon from carbon-dioxide in the dark, and

by obtaining their nitrogen from ammonia. The energy liberated during the oxidation of the nitrogen is regarded as splitting the carbon-dioxide molecule,—in green plants it is the energy of the solar rays which does this. Since the supply of free oxygen is dependent on the activity of green plants the process is indirectly dependent on energy derived from the sun, but it is none the less an astounding one and outside the limits of our previous generalizations. It has been suggested that urea is formed by polymerization of ammonium carbonate, and formic aldehyde is synthesized from CO_2 and OH_2 . The *Nitro-bacteria* are smaller, finer, and quite different from the nitroso-bacteria, and are incapable of attacking and utilizing ammonium carbonate. When the latter have oxidized ammonia to nitrite, however, the former step in and oxidize it still further to nitric acid. It is probable that important consequences of these actions result from the presence of nitrifying bacteria in rotten stone, decaying bricks, &c., where all the conditions are realized for preparing primitive soil, the breaking up of the mineral constituents being a secondary matter. That "soil" is thus prepared on barren rocks and mountain peaks may be concluded with some certainty.

In addition to the bacterial actions which result in the oxidation of ammonia to nitrous acid, and of the latter to nitric acid, the reversal of such processes is also brought about by numerous bacteria in the soil, rivers, &c. Warington showed some time ago that many species are able to reduce nitrates to nitrites, and such reduction is now known to occur very widely in nature. The researches of Gayon and Dupetit, Giltay and Aberson and others have shown, moreover, that bacteria exist which carry such reduction still further, so that ammonia or even free nitrogen may escape. The importance of these results is evident in explaining an old puzzle in agriculture, viz., that it is a wasteful process to put nitrates and manure together on the land. Fresh manure abounds in denitrifying bacteria, and these organisms not only reduce the nitrates to nitrites, even setting free nitrogen and ammonia, but their effect extends to the undoing of the work of what nitrifying bacteria may be present also, with great loss. The combined nitrogen of dead organisms, broken down to ammonia by putrefactive bacteria, the ammonia of urea, and the results of the fixation of free nitrogen, together with traces of nitrogen salts due to meteoric activity, are thus seen to undergo various vicissitudes in the soil, rivers, and surface of the globe generally. The ammonia may be oxidized to nitrites and nitrates, and then pass into the higher plants and be worked up into proteids, and so be handed on to animals, eventually to be broken down by bacterial action again to ammonia; or the nitrates may be degraded to nitrites and even to free nitrogen or ammonia, which escapes.

Another important advance is in our knowledge of the part played by bacteria in the circulation of carbon in nature. The enormous masses of cellulose deposited annually on the earth's surface are, as we know, principally the result of chlorophyll action on the carbon-dioxide of the atmosphere decomposed by energy derived from the sun; and although we know little as yet concerning the magnitude of other processes of carbon-assimilation—e.g., by nitrifying bacteria—it is probably comparatively small. Such cellulose is gradually reconverted into water and carbon-dioxide, but until recently nothing positive was known as to the agents which thus break up the paper, rags, straw, leaves, and wood, &c., accumulating in cesspools, forests, marshes, and elsewhere in such abundance. The work of van Tieghem, van Senus, Frihes, Omeliansky, and others has now shown that while certain anaerobic bacteria decompose the substance of the middle lamella—chiefly pectin compounds—

*Cellulose
bacteria.*

and thus bring about the isolation of the cellulose fibres when, for instance, flax is steeped or "retted," they are unable to attack the cellulose itself. There exist in the mud of marshes, rivers, and cloacæ, &c., however, other anaerobic bacteria which decompose cellulose, probably hydrolysing it first and then splitting the products into carbon-dioxide and marsh gas. When calcium sulphate is present, the nascent methane induces the formation of calcium carbonate, sulphuretted hydrogen, and water. We have thus an explanation of the occurrence of marsh gas and sulphuretted hydrogen in bogs, and it is highly probable that the existence of these gases in the intestines of herbivorous animals is due to similar putrefactive changes on the undigested cellulose remains.

Cohn long ago showed that certain glistening particles observed in the cells of *Beggiatoa* consist of sulphur, and Winogradsky and Beyerinck have shown that a whole series of sulphur bacteria of the genera *Thiothrix*, *Chromatium*, *Spirillum*, *Monas*, &c., exist, and play important parts in the circulation of this element in nature, e.g., in marshes, estuaries, sulphur

as heat by the respiratory combustion of sugars, they do it by oxidizing hydrogen-sulphide. Beyerinck has shown that *Spirillum desulphuricans*, a definite anaerobic form, attacks and reduces sulphates, thus undoing the work of the sulphur bacteria, as certain de-nitrifying bacteria reverse the operations of nitro-bacteria. Here again therefore we have sulphur, taken into the higher plants as sulphates, built up into proteids, decomposed by putrefactive bacteria and yielding SH_2 which the sulphur bacteria oxidize, the resulting sulphur is then again oxidized to SO_3 and again combined with calcium to gypsum, the cycle being thus complete.

Chalybeate waters, pools in marshes near ironstone, &c., abound in bacteria, some of which belong to the remarkable genera *Crenothrix*, *Cladothrix*, and *Leptothrix*, and contain ferric oxide, i.e., rust, in their cell-walls. This iron deposit is not merely mechanical but is due to the physiological activity of the organism which, according to Winogradsky, liberates energy by oxidizing ferrous and ferric oxide in its protoplasm—a view not accepted by Molisch. The iron must be in certain soluble conditions, however, and the soluble bicarbonate of the protoxide of chalybeate springs seems most favourable; the hydrocarbonate absorbed by the cells is oxidized, probably thus—

The ferric hydroxide accumulates in the sheath, and gradually passes into the more insoluble ferric oxide. These actions are of extreme importance in nature, as their continuation results in the enormous deposits of bog-iron ore, ochre, and—since Molisch has shown that the iron can be replaced by manganese in some bacteria—of manganese ores.

Considerable advances in our knowledge of the various chromogenic bacteria have been made by the studies of Beyerinck, Lankester, Engelmann, Ewart, and others, and have assumed exceptional importance owing to the discovery that *Bacterio-purpurin*—

the red colouring matter contained in certain sulphur bacteria—absorbs certain rays of solar energy, and enables the organism to utilize the energy for its own life-purposes. Engelmann showed, for instance, that these red-purple bacteria collect in the ultra-red, and to a less extent in the orange and green, in bands which agree with the absorption spectrum of the extracted colouring matter. Not only so, but the evident parallelism between this absorption of light and that by the chlorophyll of green plants, is completed by the demonstration that oxygen is set free by these bacteria—i.e., by means of radiant energy trapped by their colour-screens the living cells are in both cases enabled to do work, such as the reduction of highly oxidized compounds. In the case of these red-purple bacteria the colouring matter is contained in the protoplasm of the cell, but in most chromogenic bacteria it occurs as excreted pigment on and between the cells, or is formed by their action in the medium. Ewart has confirmed the principal conclusions concerning these purple, and also the so-called chlorophyll bacteria (*B. viride*, *B. chlorinum*, &c.), the results going to show that these are, as many authorities have held, merely minute Algae. The pigment itself may be soluble in water, as is the case with the blue-green fluorescent body formed by *B. pyocyaneus*, *B. fluorescens*, and a whole group of fluorescent bacteria. Neelson found that the pigment of *B. cyanogenus* gives a band in the yellow and strong lines at E and F in the solar spectrum—an absorption spectrum almost identical with that of triphenyl-rosaniline. In the case of the scarlet and crimson red pigments of *B. prodigiosus*, *B. ruber*, &c., the violet of *B. violaceus*, *B. janthinus*, &c., the red-purple of the sulphur bacteria, and indeed most

Iron
bacteria.

bacteria.

FIG. 7.—A plate-culture of a bacillus which had been exposed for four hours, on 30th March, behind a zinc stencil-plate, in which the letters C and B were cut. The light had to traverse a screen of water before passing through the C, and one of Aesculin (which filters out the blue and violet rays) before passing the B. The plate was then incubated, and, as the figure shows, the bacteria on the C-shaped area were all killed, whereas they developed elsewhere on the plate (traces of the B are just visible to the right) and covered it with an opaque growth. (Original.)

springs, &c. When cellulose bacteria set free marsh gas, the nascent gas reduces sulphates—e.g., gypsum—with liberation of SH_2 , and it is found that the sulphur bacteria thrive under such conditions by oxidizing the SH_2 and storing the sulphur in their own protoplasm. If the SH_2 runs short they oxidize the sulphur again to sulphuric acid, which combines with any calcium carbonate present and forms sulphate again. Similarly nascent methane may reduce iron salts, and the black mud in which these bacteria often occur owes its colour to the FeS formed. Beyerinck and Jegunow have shown that some partially anaerobic sulphur bacteria can only exist in strata at a certain depth below the level of quiet waters where SH_2 is being set free below by the bacterial decompositions of vegetable mud and rises to meet the atmospheric oxygen coming down from above, and that this zone of physiological activity rises and falls with the variations of partial pressure of the gases due to the rate of evolution of the SH_2 . In the deeper parts of this zone the bacteria absorb the SH_2 , and, as they rise, oxidize it and store up the sulphur; then ascending into planes more highly oxygenated, oxidize the sulphur to SO_3 . These bacteria therefore employ SH_2 as their respiratory substance, much as higher plants employ carbohydrates—instead of liberating energy

bacterial pigments, solution in water does not occur, though alcohol extracts the colour readily. Finally, there are a few forms which yield their colour to neither alcohol nor water, e.g., the yellow *Micrococcus cereus-flavus* and the *B. berolinensis*. Much work is still necessary before we can estimate the importance of these pigments. Their spectra are only imperfectly known in a few cases, and the bearing of the absorption on the life-history is still a mystery. In many cases the colour-production is dependent on certain definite conditions—temperature, presence of oxygen, nature of the food-medium, &c. Ewart's important discovery that some of these lipochrome pigments occlude oxygen, while others do not, may have bearings on the facultative anaerobism of these organisms.

A branch of bacteriology which offers numerous problems of importance is that which deals with the organisms so common in milk, butter, and cheese. Milk is a medium not only admirably suited to the growth of bacteria, but, as a matter of fact, always contaminated with these organisms in the ordinary course of supply. Lafar has stated that 20 per cent. of the cows in Germany suffer from tuberculosis, which also affected 17.7 per cent. of the cattle slaughtered in Copenhagen between 1891 and 1893, and that one in every thirteen samples of

*Dairy
bacteria.*

FIG. 8.—A similar preparation to Fig. 7, except that two slit-like openings of equal length allowed the light to pass, and that the light was that of the electric arc passed through a quartz prism and casting a powerful spectrum on the plate. The upper slit was covered with glass, the lower with quartz. The bacteria were killed over the clear areas shown. The left-hand boundary of the clear area corresponds to the line F (green end of the blue), and the beginning of the ultra-violet was at the extreme right of the upper (short) area. The lower area of bactericidal action extends much farther to the right, because the quartz allows more ultra-rays to pass than does glass. The red-yellow-green to the left of F were without effect. (Original.)

milk examined in Paris, and one in every nineteen in Washington, contained tubercle bacilli. Hence the desirability of sterilizing milk used for domestic purposes becomes imperative. No milk is free from bacteria, because the external orifices of the milk-ducts always contain them, but the forms present in the normal fluid are principally those which induce such changes as the souring or "turning" so frequently observed in standing milk (these were examined by Lord Lister as long ago as 1873-77, though several other species are now known), and those which bring about the various changes and fermentations in butter and cheese made from it. The presence of foreign germs, which may gain the upper hand and totally destroy the flavours of butter and cheese, has led to the search for those particular forms to which the approved properties are due. A definite bacillus to which the peculiarly fine flavour of certain butters is due, is said to be largely em-

ployed in pure cultures in American dairies, and in Denmark certain butters are said to keep fresh much longer owing to the use of pure cultures and the treatment employed to suppress the forms which cause rancidity. Quite distinct is the search for the germs which cause undesirable changes, or "diseases"; and great strides have been made in discovering the bacteria concerned in rendering milk "ropy," butter "oily" and "rancid," &c. Cheese in its numerous forms contains myriads of bacteria, and some of these are now known to be concerned in the various processes of ripening and other changes affecting the product, and although little is known as to the exact part played by any species, practical applications of the discoveries of the decade 1890-1900 have been made, e.g., Edam cheese. The Japanese have cheeses resulting from the bacterial fermentation of boiled Soja beans.

That bacterial fermentations are accompanied by the evolution of heat is an old experience; but the discovery that the "spontaneous" combustion of sterilized cotton-waste does not occur simply if moist and freely exposed to oxygen, but results when the washings of fresh waste are added, has led to clearer proof that the heating of hay-stacks, hops, tobacco, and other vegetable products is due to the vital activity of bacteria and fungi, and is physiologically a consequence of respiratory processes like those in malting. It seems fairly established that when the preliminary heating process of fermentation is drawing to a close, the cotton, hay, &c., having been converted into a highly porous friable and combustible mass, may then ignite in certain circumstances by the occlusion of oxygen, just as ignition is induced by finely divided metals. A remarkable point in this connexion has always been the necessary conclusion that the living bacteria concerned must be exposed to temperatures of at least 70° C. in the hot heaps. Apart from the resolution of doubts as to the power of spores to withstand such temperatures for long periods, the discoveries of Miquel, Globig, and others have shown that there are numerous bacteria which will grow and divide at such temperatures, e.g., *B. thermophilus*, from sewage, which is quite active at 70° C., and *B. Ludwigii* and *B. illidzensis*, &c., from hot springs, &c.

*Thermo-
philous
bacteria.*

The bodies of sea fish, e.g., mackerel and other animals, have long been known to exhibit phosphorescence. This phenomenon is due to the activity of a whole series of marine bacteria of various genera, the examination and cultivation of which have been successfully carried out by Cohn, Beyerinck, Fischer, and others. The cause of the phosphorescence is still a mystery. The suggestion that it is due to the oxidation of a body excreted by the bacteria seems answered by the failure to filter off or extract any such body. Beyerinck's view that it occurs at the moment peptones are worked up into the protoplasm cannot be regarded as proved, and the same must be said of the suggestion that the phosphorescence is due to the oxidation of phosphoretted hydrogen. The conditions of phosphorescence are, the presence of free oxygen, and, generally, a relatively low temperature, together with a medium containing sodium chloride, and peptones, but little or no carbohydrates. Considerable differences occur in these latter respects, however, and interesting results were obtained by Beyerinck with mixtures of species possessing different powers of enzyme action as regards carbohydrates. Thus, a form termed *Photobacterium phosphorescens* by Beyerinck will absorb maltose, and will become luminous if that sugar is present, whereas *P. Pflugerii* is indifferent to maltose. If then we prepare densely insemminated plates of these two bacteria in gelatine food-medium to which starch is added as the only carbohydrate, the bac-

*Phosphor-
escent
bacteria.*

teria grow but do not phosphoresce. If we now streak these plates with an organism, *e.g.*, a yeast, which saccharifies starch, it is possible to tell whether maltose or levulose and fructose are formed; if the former, only those plates containing *P. phosphorescens* will become luminous; if the latter, only those containing *P. Pflugeri*.

It has long been known that the production of vinegar depends on the oxidation of the alcohol in wine or beer to acetic acid, the chemical process being probably carried out in two stages, viz., the oxidation of the alcohol leading to the formation of the aldehyde and water, and the further oxidation of the aldehyde to acetic acid. The process may even go farther, and the acetic acid be oxidized to CO_2 and OH_2 ; the art of the vinegar-maker is directed to preventing the accomplishment of the last stage. These oxidations are brought about by the vital activity of several bacteria, of which four—*Bacterium aceti*, *B. pasteurianum*, *B. kützianum*, and *B. xylinum*—have been thoroughly studied by Hansen and A. Brown. It is these bacteria which form the zoogloea of the "mother of vinegar," though this film may contain other organisms as well. The idea that this film of bacteria oxidizes the alcohol beneath by merely condensing atmospheric oxygen in its interstices, after the manner of spongy platinum, has long been given up; but the explanation of the action as an incomplete combustion, depending on the peculiar respiration of these organisms—much as in the case of nitrifying and sulphur bacteria—is not clear, though the discovery that the acetic bacteria will not only oxidize alcohol to acetic acid, but further oxidize the latter to CO_2 and OH_2 supports the view that the alcohol is absorbed by the organism and employed as its respirable substance. Promise of more light on these oxidation fermentations is afforded by the recent discovery that not only bacteria and fungi, but even the living cells of higher plants, contain peculiar enzymes which possess the remarkable property of "carrying" oxygen—much as it is carried in the sulphuric acid chamber—and which have therefore been termed oxydases. It is apparently the presence of these oxydases which causes certain wines to change colour and alter in taste when poured from bottle to glass, and so exposed to air.

Much as the decade from 1880-90 abounded with investigations on the reactions of bacteria to heat, so the following decade was remarkable for discoveries regarding the effects of other forms of radiant energy. The observations of Downes and Blunt in 1877 left it uncertain whether the bactericidal effects in broth cultures exposed to solar rays were

Fig. 9.—Ginger-beer plant, showing yeast (*Saccharomyces pyruiformis*) entangled in the meshes of the bacterium (*B. vermiciforme*). (Original.)

due to thermal action or not. Further investigations, in which Arloing, Buchner, Chmelewski, and others took part, have led to the proof that rays of light alone are quite capable of killing these organisms. The principal questions were satisfactorily settled by Marshall Ward's experiments in 1892-93, when he showed that even the spores of *B. anthracis*, which withstand temperatures of

100° C. and upwards, can be killed by exposure to rays of reflected light at temperatures far below anything injurious, or even favourable to growth. He also showed that the bactericidal action takes place in the absence of food materials, thus proving that it is not merely a poisoning effect of the altered medium. The principal experiments also indicate that it is the rays of highest refrangibility—the blue-violet and ultra-violet rays of the spectrum—which bring about the destruction of the organisms (Figs. 7, 8). The practical effect of the bactericidal action of solar-light is the destruction of enormous quantities of germs in rivers, the atmosphere, and other exposed situations, and experiments have shown that it is especially the pathogenic bacteria—anthrax, typhoid, &c.—which thus succumb to light-action; the discovery that the electric arc is very rich in bactericidal rays led to the hope that it could be used for disinfecting purposes in hospitals, but mechanical difficulties intervene. The recent application of the action of bactericidal rays to the cure of lupus is, however, an extension of the same discovery. Even when the light is not sufficiently intense, or the exposure is too short to kill the spores, the experiments show that attenuation of virulence may result, a point of extreme importance in connexion with the lighting and ventilation of dwellings, the purification of rivers and streams, and the general diminution of epidemics in nature.

As we have seen, thermophilous bacteria can grow at high temperatures, and it has long been known that some forms develop on ice. The somewhat different question of the resistance of ripe spores or cells to extremes of heat and cold has received attention. Ravenel, Macfadyen, and Rowland have shown that several bacilli will bear exposure for seven days to the temperature of liquid air (−192° C. to −183° C.) and again grow when put into normal conditions. More recent experiments have shown that even ten hours' exposure to the temperature of liquid hydrogen −252° C. (21° on the absolute scale) failed to kill them. Farmer has shown the probability that in all these cases of resistance of seeds, spores, &c., the fact that completely dry albumin does not lose its coagulability on heating to 110° C. for some hours may be of importance, since it is well known that completely ripe spores and dry heat are the conditions of extreme experiments.

No sharp line can be drawn between pathogenic and non-pathogenic Schizomycetes, and some of the most marked steps in the progress of our modern knowledge of these organisms depend on the discovery that their pathogenicity or virulence can be modified—diminished or increased—by definite treatment, and, in the natural course of epidemics, by alterations in the environment. Similarly we are unable to divide Schizomycetes sharply into parasites and saprophytes, since it is well proved that a number of species—facultative parasites—can become one or the other according to circumstances. These facts, and the further knowledge that many bacteria never observed as parasites, or as pathogenic forms, produce toxins or poisons as the result of their decompositions and fermentations of organic substances, have led to important results in the applications of bacteriology to medicine.

Bacterial diseases in the higher plants have been described, but the subject requires careful treatment, since several points suggest doubts as to the organism described being the cause of the disease referred to their agency. Until recently it was urged that the acid contents of plants explained their immunity from bacterial diseases, but it is now known that many bacteria can flourish in acid media. Another objection was that even if bacteria obtained

Bacteria and heat.

Pathogenic bacteria.

Bacteriosis in plants.

access through the stomata, they could not penetrate the cell-walls bounding the intercellular spaces, for although certain anaerobic forms are known to ferment cellulose, no undoubted bacterium has been shown to possess the power of penetrating the cell-walls of living cells, unless we except the bacteroids of Leguminosæ first described by Marshall Ward in 1887, and confirmed by Miss Dawson in 1898. On the other hand a long list of plant-diseases have been of late years attributed to bacterial action. Some, *e.g.*, wet rot of potatoes, the Sereh disease of the sugar-cane, the slime fluxes of oaks and other trees, are not only very doubtful cases, in which other organisms such as yeasts and fungi play their parts, but it may be regarded as extremely improbable that the bacteria are the primary agents at all; they are doubtless saprophytic forms which have gained access to rotting tissues injured

be that Aphides or other piercing insects infect the plants, much as insects convey pollen from plant to plant, or (though in a different way) as mosquitoes infect man with malaria. If the most recent work on the cabbage disease may be accepted, the bacteria make their entry at the water pores at the margins of the leaf, and thence *via* the glandular cells to the tracheids. Nothing is known of the mode of action of bacteria on these plants, but it may be assumed with great confidence that they excrete enzymes and poisons (toxins), which diffuse into the cells and kill them, and that the effects are in principle the same as those of parasitic fungi. Support is found for this opinion in Beyerinck's discovery that the juices of tobacco plants affected with the disease known as "leaf mosaic," will induce this disease after filtration through porcelain.

In addition to such cases as the Kephir and Ginger-beer plants (Figs. 9, 10), where anaerobic bacteria are associated with yeasts, several interesting examples of symbiosis among bacteria are now known. *Bacillus* *Sym-*
charvoei ferments cane-sugar solutions in such *biosis.*
a way that normal butyric acid, inactive lactic acid, carbon-dioxide, and hydrogen result; *Micrococcus acidiparalactici*, on the other hand, ferments such solutions to optically active paralactic acid. Nencki showed, however, that if both these organisms occur together, the resulting products contain large quantities of normal butyl alcohol, a substance neither bacterium can produce alone. Other observers have brought forward other cases. Thus neither *B. coli* nor the *B. denitrificans* of Burri and Stutzer can reduce nitrates, but if acting together they so completely undo the structure of sodium nitrate that the nitrogen passes off in the free state. Van Senus showed that the concurrence of two bacteria is necessary before his *B. amylobacter* can ferment cellulose, and the case of mud bacteria which evolve sulphuretted hydrogen below which is utilized by sulphur bacteria above has already been quoted, as also that of Winogradsky's *Clostridium pasteurianum*, which is anaerobic, and can fix nitrogen only if protected from oxygen by aerobic species. It is very probable that numerous symbiotic fermentations in the soil are due to this co-operation of oxygen-protecting species with anaerobic ones, *e.g.*, *Tetanus*.

Astonishment has been frequently expressed at the powerful activities of bacteria—their rapid growth and dissemination, the extensive and profound *Activity of*
decompositions and fermentations induced by *bacteria.*
them, the resistance of their spores to desiccation, heat, &c.—but it is worth while to ask how far these properties are really remarkable when all the data for comparison with other organisms are considered. In the first place, the extremely small size and isolation of the vegetative cells place the protoplasmic contents in peculiarly favourable circumstances for action, and we may safely conclude that, weight for weight and molecule for molecule, the protoplasm of bacteria is brought into contact with the environment at far more points and over a far larger surface than is that of higher organisms, whether—as in plants—it is distributed in thin layers round the sap-vacuoles, or—as in animals—is bathed in fluids brought by special mechanisms to irrigate it. Not only so, the isolation of the cells facilitates the exchange of liquids and gases, the passage in of food materials and out of enzymes and products of metabolism, and thus each unit of protoplasm obtains opportunities of immediate action, the results of which are removed with equal rapidity, not attainable in more complex multicellular organisms. To put the matter in another way, if we could imagine all the living cells of a large oak or of a horse, having given up the specializations of function impressed on them during evolution and simply carrying

FIG. 10.—The Ginger-beer plant. A, one of the brain-like gelatinous masses into which the mature "plant" condenses; B, the bacterium with and without its gelatinous sheaths (cf. Fig. 9); C, typical filaments and rodlets in the slimy sheaths; D, stages of growth of a sheathed filament—*a* at 9 A.M., *b* at 3 P.M., *c* at 9 P.M., *d* at 11 A.M. next day, *e* at 3 P.M., *f* at 9 P.M., *g* at 10.30 A.M. next day, *h* at 24 hours later. (Original.)

by other agents. Saprophytic bacteria can readily make their way down the dead hypha of an invading fungus, or into the punctures made by insects, and Aphides have been credited with the bacterial infection of carnations, though more recent researches by Woods go to show the correctness of his conclusion that Aphides alone are responsible for the carnation disease. On the other hand, recent investigation has brought to light cases in which bacteria appear to be the primary agents in certain diseases of plants. The principal features are the stoppage of the vessels and consequent wilting of the shoots; as a rule the cut vessels on transverse sections of the shoots appear brown and choked with a dark yellowish slime in which bacteria may be detected, *e.g.*, cabbages, cucumbers, potatoes, &c. In the carnation disease and in certain diseases of tobacco and other plants the seat of bacterial action appears to be the parenchyma, and it may

out the fundamental functions of nutrition, growth, and multiplication which mark the generalized activities of the bacterial cell, and at the same time rendered as accessible to the environment by isolation and consequent extension of surface, we should doubtless find them exerting changes in the fermentible fluids necessary to their life similar to those exerted by an equal mass of bacteria, and that in proportion to their approximation in size to the latter. Ciliary movements, which undoubtedly contribute in bringing the surface into contact with larger supplies of oxygen and other fluids in unity of time, are not so rapid or so extensive when compared with other standards than the apparent dimensions of the microscopic field. The microscope magnifies the distance traversed as well as the organism, and although a bacterium which

FIG. 11.—A plate-culture colony of a species of *Bacillus-Proteus* (Hauser)—on the fifth day. The flame-like processes and outliers are composed of writhing filaments, and the contours are continually changing while the colony moves as a whole. Slightly magnified. (Original.)

covers 9-10 cm. or more in 15 minutes—say 0.1 mm. or 100 μ per second—appears to be darting across the field with great velocity, because its own small size—say $5 \times 1 \mu$ —comes into comparison, it should be borne in mind, that if a mouse 2 inches long only, travelled twenty times its own length, i.e. 40 inches in a second, the distance traversed in 15 minutes

at that rate, viz., 1000 yards, would not appear excessive. In a similar way we must be careful, in our wonder at the marvellous rapidity of cell-division and growth of bacteria, that we do not exaggerate the significance of the phenomenon. It takes any ordinary rodlet 30-40 minutes to double its length and divide into two equal daughter cells when growth is at its best (see Figs. 4 and 5); nearer the

FIG. 12.—Portions of a colony such as that in Fig. 11, highly magnified, showing the kinds of changes brought about in a few minutes, from A to B, and B to C, by the growth and ciliary movements of the filaments. The arrows show the direction of motion. (Original.)

minimum it may require 3-4 hours or even much longer. It is by no means certain that even the higher rate is greater than that exhibited by a tropical bamboo which will grow over a foot a day, or even common grasses, or asparagus, during the active period of cell-division, though the phenomenon is here complicated by the phase of exten-

sion due to intercalation of water. The enormous extension of surface also facilitates the absorption of energy from the environment, and, to take one case only, it is impossible to doubt that some source of radiant energy must be at the disposal of those prototrophic forms which decompose carbonates and assimilate carbonic acid in the dark and oxidize nitrogen in dry rocky regions where no organic materials are at their disposal, even could they utilize them. It is usually stated that the carbon-dioxide molecule is here split by means of energy derived from the oxidation of nitrogen, but apart from the fact that none of these processes can proceed until the temperature rises to the minimum cardinal point, Engelmann's experiment shows that in the purple bacteria rays are used other than those employed by green plants, and especially ultra-red rays not seen in the spectrum, and we may probably conclude that "dark rays"—i.e., rays not appearing in the visible spectrum—are absorbed and employed by these and other colourless bacteria. The purple bacteria have thus two sources of energy, one by the oxidation of sulphur and another by the absorption of "dark rays." Stoney (*Scient. Proc. R. Dub. Soc.*, 1893, p. 154) has suggested yet another source of energy, in the bombardment of these minute masses by the molecules of the environment, the velocity of which is sufficient to drive them well into the organism, and carry energy in of which they can avail themselves.

II. PATHOLOGICAL.

The action of bacteria as pathogenic agents is in great part merely an instance of their general action as producers of chemical change, yet bacteriology as a whole has become so extensive, and has so important a bearing on subjects widely different from one another, that division of it has become essential.

The science will accordingly be treated in this section from the pathological standpoint only. It will be considered under the three following heads, viz. (1) the methods employed in the study; (2) the modes of action of bacteria and the effects produced by them; and (3) the facts and theories with regard to immunity against bacterial disease.

The demonstration by Pasteur (see SCHIZOMYCETES, *Ency. Brit.*, ninth ed.) that definite diseases could be produced by bacteria, proved a great stimulus to research in the etiology of infective conditions, and the result was a rapid advance in human knowledge.

An all-important factor in this remarkable progress was the introduction by Koch of solid culture media, of the "plate-method," &c., an account of which he published in 1881. By means of these the modes of cultivation, and especially of separation, of bacteria were greatly simplified. Various modifications have since been made, but the routine methods in bacteriological procedure still employed are in great part those given by Koch. By 1876 the anthrax bacillus had been obtained in pure culture by Koch, and some other pathogenic bacteria had been observed in the tissues, but it was in the decade 1880-90 that the most important discoveries were made in this field. Thus the bacteria of suppuration, tubercle, glanders, diphtheria, typhoid fever, cholera, tetanus, and others were identified, and their relationship to the individual diseases established. In the last decade of the 19th century the chief discoveries were of the bacillus of influenza (1892), and of the bacillus of plague (1894).¹ Immunity against diseases produced by bacteria has been the subject of systematic research from 1880 onwards. In producing active immunity by the attenuated virus, Duguid and Burdon-Sanderson, and Greenfield in Great Britain, and Pasteur, Toussaint, and Chauveau in France, were pioneers. The work of Metchnikoff, dating from about 1884, has proved of high importance, his theory of phagocytosis having proved a great stimulus to research, and having also contributed to important advances. The modes by which bacteria produce their effects also became a subject of study, and attention was naturally turned to their toxic products. The earlier work, notably that of Brieger, chiefly concerned ptomaines (*vide infra*), but no great advance resulted. A new field of inquiry was, however, opened up when, by filtration, a bacterium-

free toxic fluid was obtained which produced the important symptoms of the disease—in the case of diphtheria by Roux and Yersin (1888), and in the case of tetanus a little later by various observers. Research was thus directed towards ascertaining the nature of the toxic bodies in such a fluid, and Brieger and Fraenkel (1890) found that they were proteids, to which they gave the name "toxalbumins." Though subsequent researches have on the whole confirmed these results, it is still a matter of dispute whether these proteids are the true toxins or merely contain the toxic bodies precipitated along with them. In the United Kingdom the work of Sidney Martin, in the separation of toxic substances from the bodies of those who have died from certain diseases, is also worthy of mention. Immunity against toxins also became a subject of investigation, and the result was the discovery of the antitoxic action of the serum of animals immunized against tetanus toxin by Behring and Kitasato (1890), and by Tizzoni and Cattani. A similar result was also obtained in the case of diphtheria. The facts with regard to passive immunity were thus established, and were put to practical application by the introduction of diphtheria antitoxin as a therapeutic agent in 1894. The technique of serum preparation has become since that time greatly elaborated and improved, the work of Ehrlich in this respect being specially noteworthy. The laws of passive immunity were shown to hold also in the case of immunity against living organisms by Pfeiffer (1894), and various anti-bacterial sera have been introduced. Of these the anti-streptococcal serum of Marmorek (1895) is probably the most important. The principles of protective inoculation have been developed and practically applied on a large scale, notably by Haffkine in the case of cholera (1893) and plague (1896), and recently by Wright and Semple in the case of typhoid fever. One other discovery of great importance may be mentioned, viz., the agglutinative action of the serum of a patient suffering from a bacterial disease, first discovered in the case of typhoid fever independently by Widal and by Grünbaum in 1896, though led up to by the work of Pfeiffer, Gruber and Durham, and others. Thus a new aid was added to medical science, viz., serum diagnosis of disease. It will thus be seen that the last decade of the 19th century was largely occupied with the investigation of toxins, of questions of immunity, and of the properties of the serum of immunized animals; it will stand out in the history of medical science as the period in which serum therapeutics and serum diagnosis had their birth.

The methods employed in studying the relation of bacteria to disease are in principle comparatively simple, but considerable experience and great care are necessary in applying them and in interpreting results. In any given disease there are three chief steps, viz. (1) the discovery of a bacterium in the affected tissues by means of the microscope; (2) the obtaining of the bacterium in pure culture; and (3) the production of the disease by inoculation with a pure culture. By means of microscopic examination more than one organism may sometimes be observed in the tissues, but one single organism by its constant presence and special relations to the tissue changes can usually be selected as the probable cause of the disease, and attempts towards its cultivation can then be made. Such microscopic examination requires the use of the finest lenses and the application of various staining methods. In these latter the basic aniline dyes in solution are almost exclusively used, on account of their special affinity for the bacterial protoplasm. The methods vary much in detail, though in each case the endeavour is to colour the bacteria as deeply, and the tissues as faintly, as possible. Sometimes a simple watery solution of the dye is sufficient, but very often the best result is obtained by

¹ A bacillus (*B. icteroides*) was described as the cause of yellow fever by Sanarelli in 1897, but the etiology of this disease must still (1901) be considered as *sub judice*.

increasing the staining power, *e.g.*, by addition of weak alkali, application of heat, &c., and by using some substance which acts as a mordant and tends to fix the stain to the bacteria. Excess of stain is afterwards removed from the tissues by the use of decolourizing agents, such as acids of varying strength and concentration, alcohol, &c. Different bacteria behave very differently to stains; some take them up rapidly, others slowly, some resist decolourization, others are easily decolourized. In some instances the stain can be entirely removed from the tissues, leaving the bacteria alone coloured, and the tissues can then be stained by another colour. This is the case in the methods for staining the tubercle bacillus and also in Gram's method, the essential point in which latter is the treatment with a solution of iodine before decolourizing. In Gram's method, however, only some bacteria retain the stain, while others lose it. The tissues and fluids are treated by various histological methods, but, to speak generally, examination is made either in films smeared on thin cover-glasses and allowed to dry, or in thin sections cut by the microtome after suitable hardening and fixation of the tissue. In the case of any bacterium discovered, observation must be made in a long series of instances in order to determine its invariable presence.

In cultivating bacteria outside the body various media to serve as food material must be prepared and sterilized by heat. The general principle in their preparation is to supply the nutriment in a form as

Cultivation.

nearly similar as possible to that of the natural habitat of the bacterium—in the case of pathogenic bacteria, the natural fluids of the body. The media are used either in a fluid or solid condition, the latter being obtained by a process of coagulation, or by the addition of a gelatinizing agent, and are placed in glass tubes or flasks plugged with cotton-wool. To mention examples, blood serum solidified at a suitable temperature is a highly suitable medium, and various media are made with extract of meat as a basis, with the addition of gelatine or agar as solidifying agents and of non-coagulable proteids (commercial "peptone") to make up for proteids lost by coagulation in the preparation. The reaction of the media must in every case be carefully attended to, a neutral or slightly alkaline reaction being, as a rule, most suitable. The media from the store-flasks are placed in glass test-tubes or small flasks, protected from contamination by cotton-wool plugs, and are sterilized by heat. As a rule the solid media are to be preferred, since bacterial growth appears as a discrete mass and accidental contamination can be readily recognized. Cultures are made by transferring by means of a sterile platinum wire a little of the material containing the bacteria to the medium. The tubes, after being thus inoculated, are kept at suitable temperatures, usually either at 37° C., the temperature of the body, or at about 20° C., a warm summer temperature. For maintaining a constant temperature incubators with regulating apparatus are used. The simplest case is that in which only one variety of bacterium is present, and a "pure culture" may then be obtained at once. When, however, several species are present together, means must be adopted for separating them. For this purpose various methods have been devised, the most important being the *plate-method* of Koch. In this method the bacteria are distributed in a gelatine or agar medium liquefied by heat, and the medium is then poured out on sterile glass plates or in shallow glass dishes, and allowed to solidify. Each bacterium capable of growth gives rise to a colony visible to the naked eye, and, if the colonies are sufficiently apart, an inoculation can be made from any one to a tube of culture-medium and a pure culture obtained. Of course, in applying the method means must be adopted for suitably diluting the bacterial mixture.

Another important method consists in inoculating an animal with some fluid containing the various bacteria. A pathogenic bacterium present may invade the body, and may be obtained in pure culture from the internal organs. This method applies especially to pathogenic bacteria whose growth on culture media is slow, *e.g.*, the tubercle bacillus.

The full description of a particular bacterium implies an account not only of its microscopical characters, but also of its growth characters in various culture media, its biological properties, and the effects produced in animals by inoculation. To demonstrate readily its action on various substances, certain media have been devised. For example, lactose and the other sugars are added to test the action of the bacterium on these substances; litmus is added to show changes in reaction, specially standardized media being used for estimating such changes; peptone solution is commonly employed for testing whether or not the bacterium forms indol; sterilized milk is used as a culture medium to determine whether or not it is curdled by the growth. Sometimes a bacterium can be readily recognized from one or two characters, but not infrequently a whole series of tests must be made before the species is determined; this is, for example, the case with members of the *bacillus coli* group.

The modes of cultivation described apply only to organisms which grow in presence of oxygen. Some, however—the strictly *anaerobic* bacteria—grow only in the absence of oxygen, hence means must be adopted for excluding this gas. It is found that if the inoculation be made deep down in a solid medium, growth of an anaerobic organism will take place, especially if the medium contains some reducing agent such as glucose. Such cultures are called "deep cultures." To obtain growth of an anaerobic organism on the surface of a medium, in using the plate method, and also for cultures in fluids, the air is displaced by an indifferent gas, usually hydrogen.

In testing the effects of bacteria by inoculation the smaller rodents, rabbits, guinea-pigs, and mice, are usually employed. One great drawback in certain cases is that such animals are not susceptible to a given bacterium, or that the disease is different in character from that in the human subject. In some cases, *e.g.*, Malta fever and relapsing fever, monkeys have been used with success, but in others, *e.g.*, leprosy, none of the lower animals have been found to be susceptible. Discretion must therefore be exercised in interpreting negative results in the lower animals. For purposes of inoculation young vigorous cultures must be used. The bacteria are mixed with some indifferent fluid, or a fluid culture is employed. The injections are made by means of a hypodermic syringe into the subcutaneous tissue, into a vein, into one of the serous sacs, or more rarely into some special part of the body. The animal, after injection, must be kept in favourable surroundings, and any resulting symptoms noted. It may die, or may be killed at any time desired, and then a post-mortem examination is made, the conditions of the organs, &c., being observed and noted. The various tissues affected are examined microscopically and cultures made from them; in this way the structural changes and the relation of bacteria to them can be determined.

Though the causal relationship of a bacterium to a disease may be completely established by the methods given, another very important part of bacteriology is concerned with the poisons or toxins formed by bacteria. These toxins may become free in the culture fluid, and the living bacteria may then be got rid of by filtering through a filter of unglazed porcelain, whose pores are

Inoculation.

sufficiently small to retain them. The passage of the fluid is readily effected by negative pressure produced by an ordinary water exhaust-pump. The effects of the filtrate are then tested by the methods used in pharmacology. In other instances the toxins are retained to a large extent within the bacteria, and in this case the dead bacteria are injected as a suspension in fluid. Sometimes, as in the preparation of Koch's new tuberculin, the bacteria are bruised in an agate mortar, so as to set free the intracellular toxins. The bacteria are usually killed by chloroform vapour or some volatile antiseptic, the agent used being afterwards got rid of by evaporation; when the toxins are comparatively resistant to heat, a suitable temperature may be used for the purpose. The study of the nature of toxins requires of course the various methods of organic chemistry. Attempts to obtain them in an absolutely pure condition have, however, failed in important cases. So that when a "toxin" is spoken of, a mixture with other organic substances is usually implied. Or the toxin may be precipitated with other organic substances, purified to a certain extent by re-solution, re-precipitation, &c., and desiccated. A "dry toxin" is thus obtained, though still in an impure condition. Toxic substances have also been separated by corresponding methods from the bodies of those who have died of certain diseases, and the action of such substances on animals is in some cases an important point in the pathology of the disease. Another auxiliary method has been applied in this department, viz., the separation of organic substances by filtration under high pressure through a colloid membrane, gelatine supported in the pores of a porcelain filter being usually employed. It has been found, for example, that a toxin may pass through such a filter while an antitoxin may not. The methods of producing immunity will be described in connexion with that subject.

The fact that in anthrax, one of the first diseases to be fully studied, numerous bacilli are present in the blood of infected animals, gave origin to the idea that the organisms might produce their effect by using up the oxygen of the blood. Such action is now known to be quite a subsidiary matter. And although effects may sometimes be produced in a mechanical manner by bacteria plugging capillaries of important organs, *e.g.*, brain and kidneys, it may now be stated as an accepted fact that all the important results of bacteria in the tissues are due to poisonous bodies or toxins formed by them. Here, just as in the general subject of fermentation, we must inquire whether the bacteria form the substances in question directly or by means of non-living ferments or enzymes. With regard to toxin formation the following general statements may be made. In certain instances, *e.g.*, in the case of the tetanus and diphtheria bacilli, the production of soluble toxins can be readily demonstrated by filtering a culture in bouillon germ-free by means of a porcelain filter, and then injecting some of the filtrate into an animal. In this way the characteristic features of the disease can be reproduced. Such toxins being set free in the culture medium are often known as *extracellular*. In many cases, however, the filtrate, when injected, produces comparatively little effect, whilst toxic action is observed when the bacteria in a dead condition are used; this is the case with the organisms of tubercle, cholera, typhoid, and many others. The toxins are here manifestly contained within the bodies of the bacteria, *i.e.*, are *intracellular*, though they may become free on disintegration of the bacteria. The distinction between the two varieties, though convenient, must not be pushed too far, as we know little regarding

their mode of formation. Although the formation of toxins with characteristic action can be demonstrated by these two methods, it must not be inferred that this can be done in every instance. On the contrary, it is highly probable that some toxins are only produced in the living tissues. We have at least examples of intense local toxic action round living bacteria, which have not yet been reproduced by means of separated toxins. Not only are the general symptoms of poisoning in bacterial disease due to toxic substances, but also the tissue changes, many of them of inflammatory nature, in the neighbourhood of the bacteria. Thus, to mention examples, diphtheria toxin produces inflammatory oedema which may be followed by necrosis; dead tubercle bacilli give rise to a tubercle-like nodule, &c. Furthermore a bacillus may give rise to more than one toxic body, either as stages in one process of change or as distinct products. Thus paralysis following diphtheria is in all probability due to a particular modification of the ordinary toxin, sometimes formed in specially large amount.

Regarding the chemical nature of toxins less is known than regarding their physiological action. Though an enormous amount of work has been done on the subject, no important bacterial toxin has as yet been obtained in a pure condition, and, though many of them are probably of proteid nature, even this cannot be asserted with absolute certainty. Brieger, in his earlier work, found that alkaloids were formed by bacteria in a variety of conditions, and that some of them were poisonous. These alkaloids he called *ptomaines*. The methods used in the investigations were, however, open to objection, and it is now recognized that although organic bases may sometimes be formed, and may be toxic, the important toxins are not of that nature. A later research by Brieger along with Fraenkel pointed to the extracellular toxins of diphtheria, tetanus, and other diseases being of proteid nature, and various other observers have arrived at a like conclusion. The general result of such research has been to show that the toxic bodies are, like proteids, precipitable by alcohol and various salts; they are soluble in water, are somewhat easily dialysable, and are relatively unstable both to light and heat. Attempts to get a pure toxin by repeated precipitation and solution have resulted in the production of a whitish amorphous powder with highly toxic properties. Such a powder gives a proteid reaction, and is no doubt largely composed of albumoses, hence the name *toxalbumoses* has been applied. The question has, however, been raised whether the toxin is really itself a proteid, or whether it is not merely carried down with the precipitate. Recently Brieger and Boer have, by precipitation with certain salts, notably of zinc, obtained a body which is toxic but gives no reaction of any form of proteid. There is of course the possibility that the toxin is a proteid, but is in so small amount that it escapes detection. These facts show the great difficulty of the problem, which is probably insoluble by present methods of analysis; the only test, in fact, for the existence of a toxin is its physiological effect. It may also be mentioned that many toxins have now been obtained by growing the particular organism in a proteid-free medium, a fact which shows that if the toxin is a proteid it may be formed synthetically by the bacterium as well as by modification of proteid already present. With regard to the nature of intracellular toxins, there is even greater difficulty in the investigation and still less is known. Many of them, probably also of proteid nature, are much more resistant to heat; thus the intracellular toxins of the tubercle bacillus retain certain of their effects even after exposure to 100° C.

Separation of toxins.

Nature of toxins.

Bacteria as agents of disease.

We cannot as yet speak definitely with regard to the part played by enzymes in these toxic processes. Certain toxins resemble enzymes as regards their conditions of precipitation and relative instability, and the fact that in most cases a considerable period intervenes between the time of injection and the occurrence of symptoms has been adduced in support of the view that enzymes are present. In the case of diphtheria Sidney Martin obtained toxic albumoses in the spleen, which he considered were due to the digestive action of an enzyme formed by the bacillus in the membrane and absorbed into the circulation. According to this view, then, a part at least of the directly toxic substance is produced in the living body by enzymes present in the so-called toxin obtained from the bacterial culture. Recent researches go to show that enzymes play a greater part in fermentation by living ferments than was formerly supposed, and by analogy it is likely that they are also concerned in the processes of disease. But this has not been proved, and hitherto no enzyme has been separated from a pathogenic bacterium capable of forming, by digestive or other action, the toxic bodies from proteids outside the body.

The action of toxins is little understood. It consists in all probability of disturbance, by means of the chemical affinities of the toxin, of the highly complicated molecules of living cells. This disturbance results in disintegration to a varying degree, and may produce changes visible on microscopic examination. In other cases such changes cannot be detected, and the only evidence of their occurrence may be the associated symptoms. The very important work of Ehrlich on diphtheria toxin shows that in the molecule of toxin there are at least two chief atom groups—one, the “haptophorous,” by which the toxin molecule is attached to the cell protoplasm; and the other the “toxophorous,” which has a ferment-like action on the living molecule, producing a disturbance which results in the toxic symptoms. On this theory, susceptibility to a toxin will imply both a chemical affinity of certain tissues for the toxin molecule and also sensitiveness to its action.

A bacterial infection when analysed is seen to be of the nature of an intoxication. There is, however, another all-important factor concerned, viz., the multiplication of the living organisms in the tissues; this is essential to, and regulates, the supply of toxins. It is important that these two essential factors should be kept clearly in view, since the means of defence against any disease may depend either upon the power of neutralizing toxins or of killing the organisms producing them. It is to be noted that there is no fixed relation between toxin production and bacterial multiplication in the body, some of the organisms most active as toxin producers having comparatively little power of invading the tissues.

We shall now consider how bacteria may behave when they have gained entrance to the body, what effects may be produced, and what circumstances may modify the disease in any particular case. The extreme instance of bacterial invasion is found in some of the septicæmias in the lower animals, e.g., anthrax septicæmia in guinea-pigs, pneumococcus septicæmia in rabbits. In such diseases the bacteria, when introduced into the subcutaneous tissue, rapidly gain entrance to the blood stream and multiply freely in it, and by means of their toxins cause symptoms of general poisoning. A widespread toxic action is indicated by the lesions found—cloudy swelling, which may be followed by fatty degeneration, in internal organs, capillary hæmorrhages, &c. In septicæmia in the human subject, often due to streptococci, the process is similar, but the organisms are found especially in the capillaries of the internal organs and

may not be detectable in the peripheral circulation during life. In another class of diseases, the organisms first produce some well-marked local lesion, from which secondary extension takes place by the lymph or blood stream to other parts of the body, where corresponding lesions are formed. In this way secondary abscesses, secondary tubercle glanders and nodules, &c., result; in typhoid fever there is secondary invasion of the mesenteric glands, and clumps of bacilli are also found in internal organs, especially the spleen, though there may be little tissue change around them. In all such diseases there is seen a selective character in the distribution of the lesions, some organs being in any disease much more liable to infection than others. In still another class of diseases the bacteria flourish in some particular part of the body, and the symptoms are due to toxic absorption from it. Thus in cholera the bacteria are practically confined to the intestine, in diphtheria to the region of the false membrane, in tetanus to some wound. In the last-mentioned disease even the local multiplication depends upon the presence of other bacteria, as the tetanus bacillus has practically no power of multiplying in the healthy tissues when introduced alone.

The effects produced by bacteria may be considered under the following heads: (1) tissue changes produced in the vicinity of the bacteria, either at the primary or secondary foci; (2) tissue changes produced at a distance by absorption of their toxins; (3) symptoms. The changes in the vicinity of bacteria are to be regarded partly as the *direct result* of the action of toxins on living cells, and partly as indicating *Tissue changes.* a *reaction* on the part of the tissues. (Many such changes are usually grouped together under the heading of “inflammation” of varying degree—acute, subacute, and chronic.) Degeneration and necrosis of cells, hæmorrhages, serous and fibrinous exudations, leucocyte emigration, proliferation of connective tissue and other cells, may be mentioned as some of the fundamental changes. Acute inflammation of various types, suppuration, granulation tissue formation, &c., represent some of the complex resulting processes. The changes produced at a distance by distribution of toxins may be very manifold—cloudy swelling and fatty degeneration, serous effusions, capillary hæmorrhages, various degenerations of muscle, hyaline degeneration of small blood-vessels, and, in certain chronic diseases, waxy degeneration, all of which may be widespread, are examples of the effects of toxins, rapid or slow in action. Again, in certain cases the toxin has a special affinity for certain tissues. Thus in diphtheria changes both in nerve cells and nerve fibres have been found, and in tetanus minute alterations in the nucleus and protoplasm of nerve cells.

The lesions mentioned are in many instances necessarily accompanied by functional disturbances or clinical symptoms, varying according to site, and to the nature and degree of the affection. In addition, *Symptoms.* however, there occur in bacterial diseases symptoms to which the correlated structural changes have not yet been demonstrated. Amongst these the most important is fever with increased proteid metabolism, attended with disturbances of the circulatory and respiratory systems. Nervous symptoms, somnolence, coma, spasms, convulsions, and paralysis are of common occurrence. All such phenomena, however, are likewise due to the disturbance of the molecular constitution of living cells. Alterations in metabolism are found to be associated with some of these, but with others no corresponding physical change can be demonstrated. The action of toxins on various glands, producing diminished or increased functional activity, has a close analogy to that of certain drugs.

The result of the entrance of a given bacterium into the tissues of an animal is not a disease with hard and fast characters, but varies greatly with circumstances. With regard to the subject of infection the chief factor is susceptibility; with regard to the bacterium virulence is all-important. Susceptibility, as

Susceptibility.

is well recognized, varies much under natural conditions in different species, in different races of the same species, and amongst individuals of the same race. It also varies with the period of life, young subjects being more susceptible to certain diseases, e.g., diphtheria, than adults. Further, there is the very important factor of acquired susceptibility. It has been experimentally shown that conditions such as fatigue, starvation, exposure to cold, &c., lower the general resisting powers and increase the susceptibility to bacterial infection. So also the local powers of resistance may be lowered locally by injury or depressed vitality. In this way conditions formerly believed to be the causes of disease are now recognized as playing their part in predisposing to the action of the true causal agent, viz., the bacterium. In health the blood and internal tissues are bacterium-free; after death they offer a most suitable pabulum for various bacteria; but between these two extremes lie states of varying liability to infection. The circumstances which alter the virulence of bacteria will be referred to again in connexion with immunity, but it may be stated here that, as a general rule, the virulence of an organism towards an animal is increased by sojourn in the tissues of that animal. The increase of virulence becomes especially marked when the organism is inoculated from animal to animal in series, the method of *passage*. This is chiefly to be regarded as an adaptation to surroundings, though the fact that the less virulent members of the bacterial species will be liable to be killed off also plays a part. Conversely, the virulence tends to diminish on cultivation on artificial media outside the body, especially in circumstances little favourable to growth.

By immunity, is meant non-susceptibility to a given disease, or to experimental inoculation with a given bacterium or toxin. The term must be used in **Immunity.** a relative sense, and account must always be taken of the conditions present. An animal may be readily susceptible to a disease on experimental inoculation, and yet rarely or never suffer from it naturally, because the necessary conditions of infection are not supplied in nature. That an animal possesses natural immunity can only be shown on exposing it to such conditions, this being usually most satisfactorily done in direct experiment. Further, there are various degrees of immunity, and in this connexion conditions of local or general diminished vitality play an important part in increasing the susceptibility. Animals naturally susceptible may acquire immunity, on the one hand by successfully passing through an attack of the disease, or, on the other hand, by various methods of inoculation. Two chief varieties of artificial immunity are now generally recognized, differing chiefly according to the mode of production. In the first—*active immunity*—a reaction or series of reactions is produced in the body of the animal, usually by injections of bacteria or their products. The second—*passive immunity*—is produced by the transference of a quantity of the serum of an animal actively immunized to a fresh animal; the term is applied because there is brought into play no active change in the tissues of the second animal. The methods of active immunity have been practically applied in *preventive inoculation* against disease; those of passive immunity have given us *serum therapeutics*. The chief facts with regard to each may now be stated.

I. *Active Immunity*.—The key to the artificial estab-

lishment of active immunity is given by the fact long established that recovery from an attack of certain infective diseases is accompanied by protection for varying periods of time against a subsequent attack. Hence follows the idea of producing a modified attack of the disease as a means of prevention—a principle which had been previously applied in inoculation against smallpox. Immunity, however, probably results from certain substances introduced into the system during the disease rather than from the disease itself; for by properly adjusted doses of the poison (in the widest sense), immunity may result without any symptoms of the disease occurring. Of the chief methods used in producing active immunity the first is by inoculation with bacteria whose virulence has been diminished, i.e., with an "attenuated virus." Many of the earlier methods of attenuation were devised in the case of the anthrax bacillus, an organism which is, however, somewhat exceptional as regards the relative stability of its virulence. Many such methods consist, to speak generally, in growing the organism outside the body under somewhat unsuitable conditions, e.g., at higher temperatures than the optimum, in the presence of weak antiseptics, &c. The virulence of many organisms, however, becomes diminished when they are grown on artificial media, and the diminution is sometimes accelerated by passing a current of air over the surface of the growth. Sometimes also the virulence of a bacterium for a particular kind of animal becomes lessened on passing it through the body of one of another species. Cultures of varying degree of virulence can be obtained by such methods, and immunity can be gradually increased by inoculation with vaccines of increasing virulence. The immunity may be made to reach a very high degree by ultimately using cultures of intensified virulence, this "supervirulent" character being usually attained by the method of *passage* already explained. A second method is by injection of the bacterium in the dead condition, whereby immunity against the living organism may be produced. Here manifestly the dose may be easily controlled, and may be gradually increased in successive inoculations. This method has a wide application. A third method is by injections of the separated toxins of a bacterium, the resulting immunity being not only against the toxin, but, so far as present knowledge shows, also against the living organism. It appears to be a general law that, when an animal becomes immune to the toxic products of an organism, the latter ceases to be able to flourish in its tissues. In the development of toxin-immunity the doses, small at first, are gradually increased in successive inoculations; or, as in the case of very active toxins, the initial injections are made with toxin modified by heat or by the addition of various chemical substances. Immunity of the same nature can be acquired in the same way against snake and scorpion poisons, and against certain vegetable toxins, e.g., ricin, alorin, &c.

In order that the immunity may reach a high degree, either the bacterium in a very virulent state or a large dose of toxin must ultimately be used in the injections. In such cases the immunity is, to speak generally, specific, i.e., applies only to the bacterium or toxin used in its production. A certain degree of non-specific immunity or increased tissue resistance may be produced locally, e.g., in the peritoneum, by injections of non-pathogenic organisms, peptone, nucleic acid, and various other substances. In these cases the immunity is without specific character, and cannot be transferred to another animal. Lastly, in a few instances one organism has an antagonistic action to another; for example, the products of *B. pyocyaneus* have a certain protective action against *B. anthracis*. This method has, however, not yielded any important practical application.

II. *Passive Immunity: Anti-sera*.—The serum of an

animal actively immunized may have one of two properties—it may be antitoxic or it may be anti-bacterial. The

Antitoxic serum.

term antitoxic signifies that the serum has the power of neutralizing the action of the toxin, as is shown by mixing them together outside the body and then injecting them into an animal. The antitoxic serum when injected previously to the toxin also confers immunity (passive) against it; when injected after the toxin it has within certain limits a curative action, though in this case its dose requires to be large. The antitoxic property is developed in a susceptible animal by successive and gradually increasing doses of the toxin. In the earlier experiments on smaller animals the potency of the toxin was modified for the first injections, but in preparing antitoxin for therapeutical purposes the toxin in its unaltered condition is used, the horse being the animal usually employed. The injections are made subcutaneously and afterwards intravenously. To obtain high antitoxic power the toxin must, at least ultimately, be a powerful one; and, while the dose must be gradually increased, care must be taken that this is not done too quickly, otherwise the antitoxic power of the serum may fall and the health of the animal suffer. The serum of the animal is tested from time to time against a known amount of toxin, *i.e.*, is standardized. The unit of antitoxin in Ehrlich's new standard is the amount requisite to antagonize the unit of toxin, *i.e.*, 100 times the minimum lethal dose to a guinea-pig of 500 grm. weight, "antagonizing" action signifying that a fatal result does not follow within five days after the injection. In the case of diphtheria the antitoxic power of the serum may reach 800 units per cubic centimetre, or even more. The laws of antitoxin production and action are not confined to bacterial toxins, but apply also to other vegetable and animal toxins, resembling them in constitution, *viz.*, the vegetable toxalbumoses and the snake-venom group referred to above.

The production of antitoxin is one of the most striking facts of biological science, and two important questions with regard to it must next be considered, *viz.*, how does the antitoxin act? and how is it formed within the body? Theoretically there are two possible modes of action: antitoxin may act by means of the cells of the body, *i.e.*, indirectly or physiologically; or it may act directly on the toxin, *i.e.*, chemically. The second view is now practically established, and, though the question cannot be fully discussed here, the chief grounds in support of a chemical action may be given. (a) The action of antitoxin on toxin, as tested by neutralization effects, takes place more quickly in concentrated than in weak solutions, and more quickly at a warm (within certain limits) than at a cold temperature. (b) Antitoxin acts more powerfully when injected along with the toxin than when injected at the same time in another part of the body; if its action were on the tissue-cells one would expect that the site of injection would be immaterial. (c) Antitoxic action is apparently governed by the law of simple multiples; that is, the amount of antitoxin necessary to neutralize varies directly with the amount of toxin. For example, the amount necessary to neutralize five times the lethal dose being determined, twenty times that amount will neutralize a hundred times the lethal dose. In the case of physiological antagonism of drugs this relationship does not hold. (d) It has been shown by Martin and Cherry, and by Kanthack and Cobbett, that in certain instances the toxin can be made to pass through a gelatine membrane, whereas the antitoxin cannot, its molecules being of larger size. If, however, toxin be mixed with antitoxin for some time, it can no longer be passed through, presumably because it has become combined with the antitoxin.

If this view as to the chemical relationship is correct—and none of the objections brought forward appear of a cogent nature—the antitoxin may act on the toxin in one of two ways. It may produce a disintegration of the toxin molecule, or it may combine with it to produce a body whose chemical affinities are satisfied. The latter view, strongly advocated by Ehrlich, is the more probable, as it harmonizes with the facts established with regard to toxic action and the behaviour of antitoxins. His view as to the dual composition of the toxin molecule has already been mentioned, and it is evident that if the haptophorous or combining group has its affinity satisfied by union with antitoxin, the toxin will no longer combine with living cells, and will thus be rendered harmless. One other important fact in support of what has been stated is that a toxin may have its toxic action diminished, and may still require the same amount of antitoxin as previously for neutralization. This is readily intelligible on the supposition that the toxophorous group is more labile than the haptophorous. Against the view that antitoxin combines with toxin there has been brought forward the statement, notably by Calmette, that in a neutral mixture of the two substances the toxic action reappears when exposed to a temperature sufficient to destroy the antitoxin in its free condition. This result has been questioned on the ground that the time necessary for complete combination was not taken into account, but even if the result be as stated, it is quite possible that of two complicated substances in combination the more labile may be destroyed by the same temperature as when free.

Regarding the origin of the antitoxin there has been, and still is, much discussion. There are three chief possibilities: (a) that the antitoxin is a modification of the toxin; (b) that it is a substance normally present, but produced in excess under stimulation of the toxin; (c) that it is an entirely new product. The first of these, which would imply a process of a very remarkable nature, is disproved by what is observed after bleeding an animal whose blood contains antitoxin. In such a case it has been shown that, without the introduction of fresh toxin, the antitoxin is partly restored, and therefore must be produced by the living tissues. The second theory is the more probable *a priori*, and if established removes the necessity for the third. It is strongly supported by Ehrlich who, in his so-called "side-chain" (*Seitenkette*) theory, explains antitoxin production as an instance of regeneration after loss. Living protoplasm, or in other words a biogen molecule, is regarded as consisting of a central atom group (*Leistungskern*), related to which are numerous secondary atom groups, or side-chains, with unsatisfied chemical affinities. The side-chains constitute the means by which other molecules are added to the living molecule, *e.g.*, in the process of nutrition. It is by means of such side-chains that toxin molecules are attached to the protoplasm, so that the living molecules are brought under the action of the toxophorous groups of the toxins. In antitoxin production this combination takes place, though not in sufficient amount to produce toxic symptoms. It is further supposed that the combination being of somewhat firm character, the side-chains thus combined are lost for the purposes of the cell and are therefore thrown off. By the introduction of fresh toxin the process is repeated, and the regeneration of side-chains is increased. Ultimately the regeneration becomes an over-regeneration, and free side-chains produced in excess are set free and appear in the blood as antitoxin molecules. In other words the substances, which when forming part of the cells fix the toxin to the cells, constitute antitoxin molecules when free in the serum. This theory,

Formation of antitoxin.

"Side-chain" theory.

though not yet absolutely established, certainly affords the most satisfactory explanation of antitoxin production. In support of it there is the remarkable fact, discovered by Wassermann and Takaki in the case of tetanus, that there do exist in the nervous system molecules with combining affinity for the tetanus toxin. If, for example, the brain and spinal cord removed from an animal be bruised and brought into contact with tetanus toxin, a certain amount of the toxicity disappears, as shown by injecting the mixture into another animal. Further, these molecules in the nervous system present the same susceptibility to heat and other physical agencies as does tetanus antitoxin. There is therefore strong evidence that antitoxin molecules do exist as part of the living substance of nerve cells. In other diseases the evidence obtained is less definite, but in them the toxic action is less limited to a particular tissue. It has, however, been found that the serum of various animals has a certain amount of antitoxic action, and thus the basis for antitoxin production, according to Ehrlich's theory, is afforded. The theory also supplies the explanation of the power which an animal supplies of producing various antitoxins, since this depends ultimately upon susceptibility to toxic action. The explanation is thus carried back to the complicated constitution of biogen molecules in various living cells of the body.

In preparing anti-bacterial sera the lines of procedure correspond to those followed in the case of antitoxins, but the bacteria themselves in the living or dead condition are always used in the injections. Sometimes dead bacteria, living virulent bacteria, and living supervirulent bacteria, are used in succession, the object being to arrive ultimately at a high dosage, though the details vary in different instances. The serum of an animal thus actively immunized has powerful protective properties towards another animal, the amount necessary for protection being sometimes almost inconceivably small. As a rule it has no action on the corresponding toxin, *i.e.*, is not antitoxic. In addition to the protective action, such a serum may possess properties which evidence themselves by producing physical change

in the bacterium in question. The first of these is the lysogenic action, which consists in the production of a change in the corresponding bacterium whereby it becomes granular, swells up, and ultimately may undergo dissolution. Pfeiffer was the first to show that this occurred when the bacterium was injected into the peritoneal cavity of the animal immunized against it, and also when a little of the serum of such an animal was injected with the bacterium into the peritoneum of a fresh, *i.e.*, non-immunized animal. Metchnikoff and Bordet subsequently devised means by which a similar change could be produced *in vitro*, and analysed the conditions necessary for its occurrence. It has been completely established that in this phenomenon of lysogenesis there are two substances concerned, one specially developed or developed in excess, and the other present in normal serum. The former (*Immunkörper* of Ehrlich, *substance sensibilisatrice* of Bordet) is the more stable, resisting a temperature of 60° C., and though giving the specific character to the reaction cannot act alone. The latter is ferment-like and much more labile than the former, being readily destroyed at 60° C. It may be added that the protective power is not lost by exposure to the temperature mentioned, this apparently depending upon the immune body. Furthermore, lysogenic action is not confined to the case of bacteria, but obtains also with other organized structures, *e.g.*, red corpuscles (Bordet, Ehrlich and Morgenroth), leucocytes and spermatozoa (Metchnikoff). That is to say, if an animal be treated with injections of

these bodies, its serum acquires the power of dissolving them. Ehrlich and Morgenroth have shown in the case of red corpuscles that the immune body (specially developed) combines directly with the red corpuscles, and also effects a loose combination with the ferment-like substance, normally present, which he calls "addiment" or "complement." The development of the immune body with specific combining affinity thus presents an analogy to antitoxin production, the difference being that in lysogenesis another substance is necessary to complete the process.

Another property which may be possessed by an anti-bacterial serum is that of agglutination. By this is meant the aggregation into clumps of the bacteria uniformly distributed in an indifferent fluid; if the bacterium is motile its movement is arrested during the process. The process is of course observed by means of the microscope, but the clumps soon settle in the fluid and ultimately form a sediment, leaving the upper part clear. This change, visible to the naked eye, is called *sedimentation*. Charrin and Roger first showed in the case of *B. pyocyaneus* that when a small quantity of the homologous serum (*i.e.*, the serum of an animal immunized against the bacterium) was added to a fluid culture of this bacillus, growth formed a sediment instead of a uniform turbidity. Gruber and Durham showed that sedimentation occurred when a small quantity of the homologous serum was added to an emulsion of the bacterium in a small test-tube, and found that this obtained in all cases where Pfeiffer's lysogenic action could be demonstrated. Shortly afterwards Widal, and also Grünbaum, showed that the serum of patients suffering from typhoid fever, even at an early stage of the disease, agglutinated the typhoid bacillus—a fact which laid the foundation of serum diagnosis. A similar phenomenon has been demonstrated in the case of Malta fever, cholera, plague, infection with *B. coli*, "meat-poisoning" due to Gärtner's bacillus, and some other diseases. As regards the mode of action of agglutinins, Gruber and Durham consider that it consists in a change in the envelopes of the bacteria, by which they swell up and become adhesive. This view has various facts in its support, but Kruse and Nicolle have found that if a bacterial culture be filtered germ-free, an agglutinating serum still produces some change in it, so that particles suspended in it become gathered into clumps. Duclaux, for this reason, considers that agglutinins are coagulative ferments. At present it is not possible to speak definitely on this question. Of more importance, however, is the relation of agglutinative to protective power. On the other hand a protective serum has not always agglutinative action, and the early appearance of the latter property in the serum, in a disease such as typhoid fever, has been considered by some to show that the two properties have no relation to one another. This conclusion is not justified, as we must suppose that the process of immunization begins to be developed at an early period in the disease, that it gradually increases, and ultimately results in cure. It is also doubtful whether a serum with high agglutinating power has been obtained without possessing protective properties at the same time. As regards resistance to heat, agglutinins cannot be separated from protective substances. It should also be stated that agglutinins are used up in the process of agglutination, apparently combining with some element of the bacterial structure. In view of all the facts it must be admitted that the agglutinins and protective bodies are the result of corresponding reactive processes, and are probably related to one another. It may be that some protective substances, but not all, are agglutinins, or it may be that the two are distinct. In the latter case they

Agglutination.

are both to be regarded as the products of a reactive process, and it is probable that the development of all antagonistic substances which confer the special character on antimicrobial sera, as well as antitoxins, will be expressed as the formation of bodies with specific combining affinity for the organic substance introduced into the system— toxin, bacterium, red corpuscle, &c., as the case may be. The bacterium, being a complex organic substance, may thus give rise to more than one antagonistic or combining substance.

Passive immunity has thus been shown to depend upon certain substances present in the serum. After, however, these substances have disappeared, as they always do in the course of time, the animal still possesses immunity (active) for a varying period. This apparently depends upon some alteration in the cells of the body, but its exact nature is not known.

The destruction of bacteria by direct cellular agency both in natural and acquired immunity must not be over-

**Phago-
cytosis.**

looked. The behaviour of certain cells, especially leucocytes, in infective conditions led Metchnikoff to place great importance on phagocytosis. In this process there are two factors concerned, viz., the ingestion of bacteria by the cells, and the subsequent intracellular digestion. If either of these is wanting or interfered with, phagocytosis will necessarily fail as a means of defence. As regards the former, leucocytes are guided chiefly by chemotaxis, i.e., by sensitiveness to chemical substances in their surroundings—a property which is not peculiar to them but is possessed by various unicellular organisms, including motile bacteria. When the cell moves from a less to a greater degree of concentration, i.e., towards the focus of production, the chemotaxis is termed positive; when the converse obtains, negative. This apparently purposive movement has been pointed out by Verworn to depend upon stimulation to contraction or the reverse. Metchnikoff showed that in animals immune to a given organism phagocytosis is present, whereas in susceptible animals it is deficient or absent. He also showed that the development of artificial immunity is attended by the appearance of phagocytosis; also, when an anti-serum is injected into an animal, the phagocytes which formerly were indifferent might move towards and destroy the bacteria. In the light of all the facts, however, especially those with regard to anti-bacterial sera, the presence of phagocytosis cannot be regarded as the essence of immunity, but rather the evidence of its existence. It is not sufficient to state that the leucocytes are stimulated to activity; it is necessary to explain how this is brought about. When positive chemotaxis is brought into play by an anti-serum, it is just as likely that it is indirectly through some change produced in the bacterium by the anti-serum as by a direct stimulation of phagocytes. We think that the importance of phagocytosis as an explanation of immunity by Metchnikoff and his school has been considerably over-rated, but on the other hand that it is one valuable means of destroying bacteria. Extracellular destruction in the various conditions mentioned is, however, also an established fact. Evidence has been brought forward within recent years that the leucocytes constitute an important source of the antagonistic substances which appear in the serum. Much of such evidence possesses considerable weight, and seeing that these cells possess active digestive powers it is by no means improbable that substances with corresponding properties may be set free by them. To ascribe such powers to them exclusively is, however, not justifiable.

We have thus endeavoured to state some of the chief

facts with regard to artificial immunity. The subject has occupied a large proportion of bacteriological literature within recent years, and our endeavour **Natural immunity.** has been mainly to indicate the general laws which are in process of evolution. When the facts of natural immunity are examined, we find that no single explanation is possible. Natural immunity against toxins must be taken into account, and, if Ehrlich's view with regard to toxic action be correct, this may depend upon either the absence of chemical affinity of the living molecules of the tissues for the toxic molecule, or upon insensitiveness to the action of the toxophorous group. It has been shown with regard to the former, for example, that the nervous system of the fowl, which possesses immunity against tetanus toxin, has little combining affinity for it. The non-sensitiveness of a cell to a toxic body when brought into immediate relationship cannot, however, at present be explained. Then as regards natural powers of destroying bacteria, phagocytosis aided by chemotaxis plays a part, and it can be understood that an animal whose phagocytes are attracted by a particular bacterium will have an advantage over one in which this action is absent. The natural bactericidal power of the serum, as tested outside the body, also shows variations in different animals. Observations made on this property with respect to the anthrax bacillus at first gave the hope that variations in natural immunity could be thus explained, but further investigation showed that immunity did not vary *pari passu* with this property. It is, moreover, doubtful whether the bactericidal power of the serum in the living body is always indicated by the results obtained *in vitro*. We therefore cannot fully explain in every case the exact property or process on which the destruction of a bacterium in normal tissues depends.

AUTHORITIES.—Bacteriological literature has become so extensive that it is impossible to give here references to original articles, even the more important. A number of these, giving an account of classical researches, were translated from French and German, and published by the New Sydenham Society under the title *Micro-parasites in Disease: Selected Essays*, in 1886. The following list contains some of the more important books published within recent years:—ABBOTT. *Principles of Bacteriology*, 5th edit. London, 1899.—CROOKSHANK. *Bacteriology and Infective Diseases* (with bibliography), 4th edit. London, 1896.—DUGLAUX. *Traité de microbiologie*, vols. i. and ii. Paris, 1899.—FLÜGGE. *Die Mikroorganismen*, 3rd edit. Leipzig, 1896.—FISCHER. *Vorlesungen über Bakterien*. Jena, 1897.—GÜNTHER. *Einführung in das Studium der Bakteriologie*, 4th edit. Leipzig, 1893.—HEIM. *Lehrbuch der bakteriologischen Untersuchung und Diagnostik*. Stuttgart, 1894.—HEWLETT. *Manual of Bacteriology*. London, 1898.—HUEPPE. *Principles of Bacteriology* (translation). London, 1899.—KANTHACK and DRYSDALE. *Practical Bacteriology*. London, 1895.—KLEIN. *Micro-organisms and Disease*, 3rd edit. London, 1896.—LÖFFLER. *Vorlesungen über die geschichtliche Entwicklung der Lehre von der Bakterien*. Leipzig, 1887.—M'FARLAND. *Text-book upon the Pathogenic Bacteria*. London, 1896.—MUIR and RITCHIE. *Manual of Bacteriology* (with bibliography), 2nd edit. Edin. and London, 1899.—STERNBERG. *Manual of Bacteriology* (with full bibliography), 2nd edit. New York, 1896.—THOINOT et MASSELIN. *Précis de Microbie*, 3rd edit. Paris, 1896.—WURTZ. *Précis de bactériologie clinique*. Paris, 1895.—WOODHEAD. *Bacteria and their Products* (with bibliography). London, 1891. The bacteriology of the infective diseases (with bibliography) is fully given in the *System of Medicine*, edited by CLIFFORD ALLBUTT. London, 1896-1900. For references consult *Centralbl. für Bakter. u. Parasitenk.* Jena, a "General Register" of which down to June 1899 (vols. i.-xxv.) has been published; also *Index Medicus*. (R. M.)

Bacup, a municipal borough (1882) in the Rossendale parliamentary division of Lancashire, England, on the Irwell, 20 miles N. of Manchester by rail. A borough police force has been organized (1887), and a borough fire brigade constituted out of its members. An Established church has been rebuilt and a theatre erected, whilst in 1893 commodious public baths and a well-arranged recreation ground were presented to the town by Mr J. H.

Maden, M.P. Cotton spinning and power-loom weaving are the chief of the numerous manufacturing industries carried on. The principle of co-operation is strongly developed; a handsome store costing over £22,000 contains among other departments a free library for members, with upwards of 12,000 volumes. Area, 6083 acres; population (1881), 25,034; (1891), 23,498; (1901), 22,503.

Badajoz, a frontier province in the south-west of Spain, the largest of the whole kingdom with an area of 8688 square miles, only 2,850,000 acres of which are cultivated. The population grew from 475,183 in 1887 to 490,551 in 1897. The province is divided into 15 administrative districts and 162 parishes. In the north-east, south-east, and south, there are some hilly regions, but the greater part is flat or slightly undulating, and in many districts looks like a dreary steppe, with sparse vegetation that affords very meagre pasture for the numerous flocks. Comparatively little rain falls in average years, and barely 13,000 acres are properly irrigated, whilst 1,900,000 acres are devoted to pasture or covered with very thin bush and forest. The Guadiana, which flows through the north of the province, and its tributaries, have any considerable volume of water in their beds only at certain seasons of the year, and the Guadiana is often fordable in many parts of its course. Badajoz has more live stock than any other province—in all 1,302,754 head. This figure includes 10,705 horses, 33,471 mules, 38,273 asses, 35,057 cattle, 940,444 sheep, 108,354 goats, and 136,450 pigs, which supply famous hams, &c. 336,285 acres are devoted to the culture of wheat, 258,812 to oats, barley, rye; 86,437 to pod fruit; 88,942 to olive plantations, and 46,012 to vineyards. One copper and 24 lead mines are now at work, while no less than 575 are registered as unproductive. This stagnation of the mining interests is chiefly due to the lack of means of communication, though some impulse has been given of late years to the mining railways by a company that is working several concessions; another company has endeavoured to lease several good lead mines, and has bought others near the central Badajoz railway. The mines will certainly attract more notice when several local lines are completed. Among those at present unproductive are 345 lead, 170 iron, 27 copper, and 12 quick-silver, all duly registered. The local industries are not of much importance: manufactures of woollen and cotton stuffs of a coarse description, soaps, oil, cork, and leather. The purely commercial interests are more important than the industrial, because of the transit trade to and from Portugal through no less than seven custom-houses. The climate shows great extremes of heat in summer and of cold in winter, when fierce north and north-west winds blow across the plains. In the hot months intermittent fevers are prevalent, in the Guadiana valley. There are 275 miles of railways in the province, the principal being 133 miles of the main line from Madrid to Lisbon, 78 of the Merida-Seville line, and 38 of the Huelva-Zafra. The roads, state and parish, are in bad condition, and totally insufficient. Very few inhabitants emigrate from this province, where the birth-rate considerably exceeds the death-rate. Education, even primary, is in a very backward condition, not 33 per cent. of the children between four and fourteen years of age being sent to school. **BADAJOZ**, the capital of the province, is situated near the Portuguese frontier, 310 miles south-west of Madrid by rail. Population (1897), 29,006. It is still the centre of an active trade with Portugal, but the local industries have declined considerably. A serious military and republican rising took place in August 1883, but the movement found no response among the majority of the

inhabitants of the town or in the rest of Spain, and completely failed. (A. E. H.)

Badakshan.—The Afghan province of Badakshan requires new definition since the boundary agreement of 1893 limited Afghan territory to the left bank of the Oxus. Much of the interior of the province is still unexplored. On the west, Badakshan is bounded by a line which crosses the Turkestan plains southwards from the junction of the Kunduz and Oxus rivers till it touches the eastern water-divide of the Tashkurghan river (here called the Koh-i-Chungar), and then runs south-east, crossing the Sarkhab affluent of the Kunduz, till it strikes the Hindu Kush. The southern boundary is carried along the crest of the Hindu Kush as far as the Khawak pass, leading from Badakshan into the Panjshir valley. Beyond this it is indefinite. It is known that the Kafir occupy the west of the Hindu Kush eastwards of the Khawak, but how far they extend north of the main watershed is not ascertainable. The southern limits of Badakshan become definite again at the Dorah pass. The Dorah connects Zebak and Ishkashim at the elbow, or bend, of the Oxus with the Lutku valley leading to Chitral. From the Dorah eastwards the crest of the Hindu Kush again becomes the boundary till it effects a junction with the Muztagh and Sarikol ranges, which shut off China from Russia and India. Skirting round the head of the Tagdumbash Pamir, it finally merges into the lately-defined Pamir boundary, and turns westwards, following the course of the Oxus, to the junction of that river and the Kunduz. So far as the northern boundary follows the Oxus stream, under the northern slopes of the Hindu Kush, it is only separated by the length of these slopes (some 8 or 10 miles) from the southern boundary along the crest. Thus Badakshan (in which we include Wakhan) reaches out an arm into the Pamirs eastwards—bottle-shaped—narrow at the neck (represented by the northern slopes of the Hindu Kush), and swelling out eastwards so as to include a part of the great and little Pamirs (see *AFGHANISTAN*). Before the boundary settlement of 1893 the small states of Roshan and Shignan extended to the left bank of the Oxus, and the province of Darwaz, on the other hand, extended to the right bank. Now, however, the Darwaz extension northwards is exchanged for the Russian Pamir extension westwards, and the river throughout is the boundary between Russian and Afghan territory; the political boundaries of those provinces being no longer coincident with their geographical limits.

Subdivisions.—The following are the chief provincial subdivisions of Badakshan, omitting Roshan and Shignan:—On the west Rustak, Kataghan, Ghor, Narin, and Anderab; on the north Darwaz, Ragh, and Shiwa; on the east Charan, Ishkashim, Zebak, and Wakhan; and in the centre Faizabad, Farkhar, Minjan, and Kishm. There are others, but nothing certain is known about these minor subdivisions.

Physiography.—The conformation of the mountain districts, which comprise all the southern districts of Badakshan and the northern hills and valleys of Kafiristan, is undoubtedly analogous to that of the rest of the Hindu Kush westwards. The water-divide of the Hindu Kush from the Dorah to the Khawak pass, i.e. through the centre of Kafiristan, has never been accurately traced; but its topographical conformation is evidently a continuation of that which has been observed in the districts of Badakshan to the west of the Khawak. The Hindu Kush represents the southern edge of a great central upheaval or plateau. It breaks up into long spurs southwards, deep amongst which are hidden the valleys of Kafiristan, almost isolated from each other by the rugged and snow-capped altitudes which divide them. To the north the plateau gradually slopes away towards the Oxus, falling from an average altitude of 15,000 feet to 4000 feet about Faizabad, in the centre of Badakshan, but falling off to 1100 at Kunduz, in Kataghan, where it merges into the flat plains bordering the Oxus.

Rivers and Roads.—The Kokcha river traverses Badakshan from south-east to north-west, and, with the Kunduz, drains all the northern slopes of the Hindu Kush west of the Dorah pass. Some of its sources are near Zebak, close to the great bend of the Oxus

northwards, so that it cuts off all the mountainous area included within that bend from the rest of Badakshan. Its chief affluent is the Minjan, which Robertson found to be a considerable stream where it approaches the Hindu Kush close under the Dorah. Like the Kunduz, it probably drains the northern slopes of the Hindu Kush by deep lateral valleys, more or less parallel to the crest, reaching westwards towards the Khawak pass. From the Oxus (1000 ft.) to Faizabad (4000 ft.) and Zebak (8500 ft.) the course of the Kokcha offers a high road across Badakshan; between Zebak and Ishkashim, at the Oxus bend, there is but an insignificant pass of 9500 ft.; and from Ishkashim by the Panja, through the Pamirs, is the continuation of what must once have been a much-traversed trade route connecting Afghan Turkestan with Kashgar and China. It is undoubtedly one of the great continental high roads of Asia. North of the Kokcha, within the Oxus bend, is the mountainous district of Darwaz, of which the physiography belongs rather to the Pamir type than to that at the Hindu Kush.

A very remarkable meridional range extends for 100 miles northwards from the Hindu Kush (it is across this range that the route from Zebak to Ishkashim lies), which determines the great bend of the Oxus river northwards from Ishkashim, and narrows the valley of that river into the formation of a trough as far as the next bend westwards at Kila Wamar. The western slopes of this range drain to the Oxus either north-westwards, by the Kokcha and the Ragh, or else they twist their streams into the Shiva, which runs due north across Darwaz. Here again we find the main routes which traverse the country following the rivers closely. The valleys are narrow, but fertile and populous. The mountains are rugged and difficult; but there is much of the world-famous beauty of scenery, and of the almost phenomenal agricultural wealth of the valleys of Bokhara and Ferghana to be found in the as yet half-explored recesses of Badakshan. The people of the country are Tajak, dominated by Afghans.

There are no recent works on Badakshan and Darwaz which can be considered authoritative. The foregoing is compiled from unpublished notes of the Russo-Afghan and Pamir boundary surveys by the author.

(T. H. H.*)

Badalona, a town and railway station of Spain, in province and diocese of Barcelona, situated in a plain, near the left bank of the river Besos. Woollen, cotton goods, glass, biscuits, sugar, and brandy are manufactured. The country around is fertile, and produces abundantly cereals, wine, oranges, and fruit of all kinds. Population, 18,165.

Baden, a grand duchy of the German empire, with an area of 5821 square miles, and population (1885) 1,601,255, (1895) 1,725,464, of whom 847,281 were males and 878,183 females. The density in 1895 was 296 inhabitants to the square mile; and of the total population over 45 per cent. were urban (*i.e.*, lived in places above 2000 inhabitants each), and nearly 55 per cent. rural. At the same date 1,057,075 confessed the Roman Catholic faith, 637,946 were Evangelical Protestants, and there were 25,903 Jews. Of the total area, 57.2 per cent. is under cultivation and 37.5 per cent. under forests. Of the total number of farms 223,631, or 94.7 per cent., were less than 25 acres, 12,411 were between 25 and 250 acres, and only 117 exceeded 250 acres. The crops most extensively cultivated are hay, potatoes, barley, oats, spelt, rye, maize, wheat, and beetroot. In 1898 42,400 acres were planted with the vine, and the yield was 5,316,500 gallons of wine, valued at £460,000. Tobacco was planted on 21,700 acres (17,860 acres in 1898), and the yield was 20,000 tons, valued at £822,000. In the same year the live stock consisted of 650,885 cattle, 411,253 pigs, 81,821 sheep, and 71,515 horses. In 1897 the breweries produced 60,306,450 gallons of beer, and in 1898 the distilleries 945,560 gallons of pure alcohol. The total length of railways in 1898 was 1080 miles, of which 992 belonged to the state; and from them was derived (1897) a revenue of £1,067,500. In 1897 there were 173,794 hands employed in the various industries. In addition to the two universities (Heidelberg and Freiburg), and the polytechnic at Karlsruhe, there are over 220 technical, agricultural, and other special schools, 60 middle schools (classical and modern), and over 1600 elementary

schools. In 1900 the revenue and expenditure balanced at £1,125,300. The contribution to the imperial exchequer was fixed at £872,930 in 1900. The public debt, which has been incurred entirely for the construction of the railways, amounted in 1900 to £16,668,400.

Baden, or BADEN-BADEN, a town and watering-place of the grand-duchy of Baden, Germany, in the Black Forest, 23 miles S. by W. from Karlsruhe by rail. There are two chief bath establishments, the Frederick Baths (Renaissance building, 1869-77) and the Empress Augusta Baths (Renaissance, 1891-92), the former used by men only in summer, and by both sexes in winter, the latter used by women only in summer, and closed in winter. Almost every conceivable variety of bath can be had in both. The number of visitors exceeds 60,000 annually. Baden possesses a technical school. Population (1885), 12,779; (1895), 14,862.

Baden, or BADEN BEI WIEN, chief town of a government-district, and principal thermal springs and summer resort in Lower Austria, situated in the Schwechat valley, about 12 miles from Vienna. Population (1890), 11,263, or with Wickersdorf, 15,776; (1900), 12,447, Wickersdorf, 5287, all German and mostly Catholic (estimated to have 5 per cent. Jewish and 2 per cent. Protestant). It has now numerous educational institutions, new bathing establishments, fifteen in all, a town museum, new park and *kurhaus*, a summer theatre. There are about 20,000 visitors annually, including several members of the Austrian imperial family.

Badenweiler, a small village and watering-place of the grand-duchy of Baden, Germany, 28 miles N. by E. by rail from Basel, at the western edge of the Black Forest. Its new parish (Evangelical) church (1897) is built at the foot of the 11th-century castle (destroyed by the French in 1688) which belonged to the margraves of Baden. The place is visited by 5000 people annually, partly for its warm mineral springs (70°), partly for its whey cure, partly for its equable climate and picturesque surroundings. There are a *kurhaus*, built in 1853, and a park of 15 acres (1825 and 1865); also a grand-ducal castle, refitted in 1887-88. In 1784 well-preserved Roman baths were discovered here. The permanent population is about 600.

Badulla, the capital of the province of Uva, Ceylon, 54 miles S.E. of Kandy. It is the seat of a government agent and district judge, besides minor courts. It was in Kandyan times the home of a prince who ruled Uva as a principality. Badulla stands 2222 feet above sea-level; the average annual rainfall is 79½ inches; the average temperature 73°. The population of the town in 1901 was about 5600; of the Badulla district, 188,964. There is a botanic garden; and the town, being almost encircled by a river—the Badullaeya—and overshadowed by the Naminacooly Kande range of mountains (highest peak 6680 feet), is very picturesquely situated. The railway terminus at Bandarawella is 18 miles from Badulla, but there is a prospect of a tramway connexion. Tea is cultivated by the planters, and rice, fruit, and vegetables by the natives in the district.

Baer, Karl Ernst von (1792-1876), German biologist and founder of the science of comparative embryology, was born at Piep in Esthonia on the 29th February 1792. His father, a small landowner, sent him to school at Revel, which he left in his eighteenth year to study medicine at Dorpat University. Burdach's lectures suggested research in the wider field of life-history, and as at that time Germany offered quicker facilities for, and greater encouragement to, scientific work, von Baer went to Würzburg, where

the distinguished physiologist Döllinger, father of the famous Catholic theologian, was professor. In teaching von Baer comparative anatomy, Döllinger gave a direction to his studies which secured his future pre-eminence in the science of organic development. He collaborated with Pander in researches on the evolution of the chick, the results of which were first published in Burdach's treatise on physiology. Continuing his investigations alone, von Baer extended them to the evolution of organisms generally, and after a sojourn at Berlin he was invited by his old teacher Burdach, who had become professor of Anatomy at Königsberg, to join him as prosector and chief of the new Zoological Museum. Von Baer's great discovery of the human ovum is the subject of his *Epistola de Ovo Mammalium et Hominis Genesi* (Leipzig, 1827), and in the following year he published the first part of his *History of the Evolution of Animals* (*Ueber Entwicklungsgeschichte der Thiere*), which Haeckel says "even now is generally and rightly considered the most important and most valuable contribution to embryological literature." Until von Baer's discovery (for Wolff's cognate theory of epigenesis, promulgated seventy years earlier, had secured no adherents) it was believed that every egg contained, encysted as it were, the complete animal in miniature. On the logical assumption that the "animalculist" theory, as it was nicknamed, involved the existence of the preformed body in all ova, Haller made the ingenious calculation that the germs of two hundred billions of men were packed in the ovary of Eve! The "ovist" gave this fantastic speculation its quietus. Von Baer demonstrated, first, that the Graafian follicles (so named after their discoverer) in the ovary are not the actual eggs, but that they contain the spherical vesicle, which is the true ovum, a body about the $\frac{1}{160}$ th of an inch in diameter, wherein, so great is the marvel of heredity, lie the properties transmitting the physical and mental characteristics of the parent or grandparent, or even of more remote ancestors. He next showed that in all vertebrates the primary stage of cleavage of the fertilized egg is followed by modification into leaf-like germ layers—skin, muscular, vascular, and mucous—whence arise by subtle differentiation the several organs of the body. He further discovered the gelatinous, cylindrical cord, known as the *chorda dorsalis*, which passes along the body of the embryo of vertebrates, in the lower types of which it is limited to the entire inner skeleton, while in the higher the backbone and skull are developed round it. His "law" of corresponding stages in the development of vertebrate embryos had example in the fact recorded by him concerning certain specimens preserved in spirit which he had omitted to label. "I am quite unable to say to what class they belong. They may be lizards, or small birds, or very young mammalia, so complete is the similarity in the mode of formation of the head and trunk in these animals. The extremities are still absent, but even if they had existed in the earliest stage of the development we should learn nothing, because all arise from the same fundamental form." And in his *History of Evolution* he suggests, "Are not all animals in the beginning of their development essentially alike, and is there not a primary form common to all?" (i. 223). Notwithstanding this, the "telic" idea, with the archetypal theory which it involved, possessed von Baer to the end of his life, and explains his inability to accept the theory of unbroken descent with modification when it was propounded by Darwin and Wallace in 1858. The influence of von Baer's discoveries has been far-reaching and abiding. Not only is he the pioneer in that branch of biological science to which Francis Balfour, gathering up the labours of many fellow-workers, gave coherence in his *Comparative Embryology* (1881); the impetus to Huxley's researches

in the structure of the medusæ came from him (*Life*, i. 163); and Herbert Spencer found in von Baer's "law of development" the "law of all development" (*Essays*, i. 30). In 1834 von Baer was appointed librarian of the Academy of Sciences of St Petersburg. In 1835 he published his *Development of Fishes*, and as the result of collection of all available information concerning the fauna and flora of the Polar regions of the empire, he was appointed leader of an Arctic expedition in 1837. The remainder of his active life was occupied in divers fields of research, geological as well as biological, an outcome of the latter being his fine monograph on the fishes of the Baltic and Caspian Seas. One of the last works from his prolific pen was an interesting autobiography published at the expense of the Esthonian nobles on the celebration of the jubilee of his doctorate in 1864. Three years afterwards he received the Copley medal. He died at Dorpat on 28th November 1876. (E. CL.)

Baeyer, Johann Friedrich Wilhelm Adolph (1835—), German chemist, was born at Berlin, 31st October 1835. He studied chemistry under Bunsen and Kekulé, and in 1858 took his degree as Ph.D. at Berlin, becoming privat-docent a few years afterwards, and assistant professor in 1866. Five years later he was appointed professor of chemistry at Strasburg, and in 1873 he migrated in the same capacity to Munich. He has devoted himself mainly to investigations in organic chemistry, and in particular to synthetical studies by the aid of "condensation" reactions. The Royal Society of London awarded him the Davy medal in 1881 for his researches on indigo, the nature and composition of which he has done more to elucidate than any other single chemist, and which he has also succeeded in preparing artificially, though his methods have not been found commercially practicable. The "centric" view of the constitution of the benzene ring supported by him, and others of his contributions to chemical theory, are discussed in the article CHEMISTRY.

Baffin, a barren insular tract in Franklin district, Canada, with an approximate area of 230,000 square miles, situated between 61° and 90° W. long. and 62° and 74° N. lat. The eastern and northern coasts are rocky and mountainous, and are deeply indented by large bays including Frobisher and Home Bays, Cumberland Sound and Admiralty Inlet. It is separated from Greenland by Baffin Bay and Davis Strait, from Ungava by Hudson Strait, from Keewatin and Melville Peninsula by Fox Channel and Fury-and-Hecla Strait, from Boothia Peninsula and North Somerset by the Gulf of Boothia and Prince Regent Inlet, and from North Devon by Lancaster Sound. The north-western portion is called Cockburn Land; the south-western, Fox Land; and the eastern, Cumberland Land.

Bagehot, Walter (1826-1877), English publicist and economist, editor of the *Economist* newspaper from 1858-60 to his death, was born at Langport, Somerset, 3rd February 1826, his father being a banker at that place. Bagehot was altogether a remarkable personality, his writings on different subjects exhibiting the same bent of mind and characteristics,—philosophic reflectiveness, practical common-sense, a bright and buoyant humour, brilliant wit, and always a calm and tolerant judgment of men and things. Though he belonged to the Liberal party in politics he was essentially of conservative disposition, and often spoke with sarcastic boastfulness to his Liberal friends of the stupidity and tenacity of the English mind in adhering to old ways, as displayed in city and country alike. His life was comparatively

uneventful, as he early gave up to literature the energies which might have gained him a large fortune in business or a great position in the political world. To write books, he remarked to the present writer not long before he died, a man must give up a good deal; and, as a man of letters, there is no doubt he made the sacrifice for himself willingly and cheerfully, following his true bent without turning to right or left. He took his degree at the London University in 1848, and was called to the bar in 1852, but from an early date he joined his father in the banking business of Stuckey & Co. in the West of England, and during a great part of his life, while he was editor of the *Economist*, he managed the London agency of the bank, lending its surplus money in "Lombard Street," and otherwise attending to its London affairs. He became also an underwriter at Lloyd's, taking no part, however, in the active detailed business, which was done for him by proxy.

Bagehot's connexion with the *Economist* began in 1858, about which time he married a daughter of the first editor, the Right Honourable James Wilson, at that time Secretary of the Treasury, and afterwards finance minister in India. Partly through this connexion he was brought into the inside of the political life of the time. He was an intimate friend of Sir George Cornewall Lewis, and was afterwards in constant communication with other political chiefs, especially with Mr Gladstone, Mr Lowe, and Mr Grant Duff, and with the permanent heads of the great departments of state. In the City in the same way he was intimate with the governor and directors of the Bank of England, and with leading magnates in the banking and commercial world, such as Mr Bertram Currie of Glyn's, Mr Wade of the National Provincial Bank, Mr William Fowler of Alexanders', afterwards of the National Discount Company, and Mr Newmarch; while his connexion with the Political Economy Club brought him into contact in another way with both City and politics. His active life in business and politics, however, was not of so absorbing a kind as to prevent his real devotion to literature, but the literature largely grew out of his activities, and of no one can it be said more truly than of Bagehot that the atmosphere in which he lived gave tone and colour and direction to his studies, one thing of course acting and reacting on another. The special note of his books, apart from his remarkable gift of conversational epigrammatic style, which gives a peculiar zest to the writing, was the quality of scientific dispassionate description of matters which were hardly thought of previously as subjects of scientific study. This is specially the case with the two books which perhaps brought him the most reputation, *The English Constitution* (1867) and *Lombard Street* (1873). They are both books of observation and description. The English Constitution is described, not from law books and as a lawyer would describe it, but from the actual working, as Bagehot himself had witnessed it, in his contact with ministers and the heads of Government departments, and with the life of the society in which the politicians moved. The true springs and method of action are consequently described with a vivid freshness which gives the book a wonderful charm, and makes it really a new departure in the study of politics. It is the same with *Lombard Street*. The money market is there pictured as it really was in 1850-70, and as Bagehot saw it with philosophic eyes. Beginning with the sentence, "The objects which you see in Lombard Street are the Bank of England, the joint stock banks, the private banks, and the discount houses," he describes briefly and clearly the respective functions of these different bodies in the organism of the City, according to his own close observation as a banker himself, knowing the ways and thoughts of the men he describes,

and as a man of business likewise in other ways, knowing at first hand the relation of banking to the trade and commerce of the country. *Lombard Street* is perhaps a ripier work than *The English Constitution*, as its foundation was really laid in 1858 in a series of articles which Bagehot then wrote in the *Economist*, though it was not published till the early 'seventies, after it had been twice rewritten and revised with infinite labour and care. *Lombard Street*, like *The English Constitution* in political studies, is thus a new departure in economic and financial studies, applying the same sort of keen observation which Adam Smith used in the analysis of business generally to the special business of banking and finance in the complex modern world. It is, perhaps, not going too far to say that the whole theory of a one-reserve system of banking and how to work it, and of the practical means of fixing an "apprehension minimum" below which the reserve should not fall, originated in *Lombard Street* and the articles which were the foundation of it; and the subsequent conduct of banking in England and throughout the world has been infinitely better and safer in consequence. A like note is, also struck in *Physics and Politics* (1869), which is a description of the evolution of communities of men. The materials here are derived mainly from books, the surface to be observed being so extensive, but the attitude is precisely the same, that of a scientific observer. To a certain extent the *Physics and Politics* had even a more remarkable influence on opinion, at least on foreign opinion, than *The English Constitution* or *Lombard Street*. It "caught on" as a development of the theory of evolution in a new direction, and Darwin himself was greatly interested, while one of the pleasures of Bagehot's later years was to receive a translation of the book into the Russian language. In *Literary Studies* (1879) and *Economic Studies* (1880), published after his death, there is more scope than in the books already mentioned for other characteristics besides those of the scientific observer, but observation always comes to the front, as in the account of Ricardo, whom Bagehot describes as often, when he is most theoretical, really describing what a first-rate man of business would do and think in actual transactions. The observation, of course, is that of a type of business man in the City to which Ricardo as well as Bagehot belonged, though Ricardo could hardly look at it from the outside as Bagehot was able to do.

Bagehot had great City, political, and literary influence, to which all his activities contributed, and much of his influence was lasting. In politics and economics especially his habit of scientific observation affected the tone of discussion, and both the English Constitution and the Money Market have been better understood generally because he wrote and talked and diffused his ideas in every possible way. He was unsuccessful in two or three attempts to enter Parliament, but he had the influence of far more than an ordinary member, as director of the *Economist* and as the adviser behind the scenes of the Ministers and permanent heads of departments who consulted him. His death, on the 24th of March 1877, occurred at Langport very suddenly, when he was in the fullest mental vigour, and might have looked forward to the accomplishment of much additional work and the exercise of even wider influence.

It is impossible to give a full idea of the brightness and life of Bagehot's conversation, although the conversational style of his writing may help those who did not know him personally to understand it. With winged words he would transfix a fallacy or stamp a true idea so that it could not be forgotten. He was certainly greater than his books and always full of ideas. The present writer recalls two notions he had, not for writing new books

himself, but as something that might be done. One was that there might be a history of recent politics with new lights if some one were to do it who knew the family connexions and history of English politicians. This was *apropos* of the passage of a certain Bill through Parliament, when the head of the department in the House of Commons failed and the management of the measure was taken by the Chancellor of the Exchequer himself, a relative of the permanent head of the department concerned, who was thus able to carry his own ideas in legislation notwithstanding the failure of his political chief. Another book he wished to see written was an account of the differences in the administrative systems of England and Scotland, by which he had been greatly impressed, the differences not being in detail, but in fundamental idea and in form, so that no judicial or other officers in the one were represented in the other by corresponding functionaries. Many other illustrations might be given of his fulness of ideas which helped to make him an ideal editor. Reference must also be made to the assistance which Bagehot gave as a journalist to the study of statistics. From the manipulation of figures he was most averse, and he rather boasted that he was unable to add up. But he was a most excellent mathematician, and no one could be so careful as he was about the logic of the figures got together for his articles, which he always most carefully scrutinized. He would frequently point out that his figures were illustrative merely, and did not by themselves establish an argument. He was always anxious, again, to impress on those about him that a subject could not be studied with the help of figures and accounts alone. Whether it was insurance, or banking, or underwriting, or shipowning, he insisted that some one who knew the business should see the writing before it was published. Knowing so many departments of business from actual experience, he was a host in himself as referee, but when in doubt he would always consult some one who knew the facts; and he used his great influence so well that in subsequent years it inspired indirectly not a few who were hardly aware of his claims to be a statistician at all.

(R. GN.)

Baghdad, (1) a vilâyet of Asiatic Turkey, situated between Persia and the Syrian desert, and including the greater part of ancient Babylonia. The original vilâyet extended from Mardin on the north to Basra on the south, but in 1878 it was reduced in size by the creation of the Mosul vilâyet out of its northern sanjaks, and again in 1884 by that of the Basra vilâyet out of its southern sanjaks. Baghdad is still one of the largest and most important provinces of the empire, and includes some of the most fertile lands in the valleys of the Euphrates and Tigris. The climate is very hot in summer, mean temperature 97° F., but generally healthy. In November heavy rains commence, and during the winter the thermometer falls to 46° F. There are springs of bitumen, locally called *kara sakiz*, "black mastic," of naphtha, and of white petroleum in the province. Population, 852,000 (Moslems, 790,000, including 481,000 Shiâs; Christians, 8000; Jews, 54,000). (2) The capital of the vilâyet, and headquarters of the army corps which garrisons the Baghdad, Mosul, and Basra vilâyets, situated in a fertile but arid plain on both banks of the Tigris. Eastern Baghdad, on the left bank, is the larger and more modern city, and contains the principal buildings, bazârs, &c. A bridge of boats connects it with "Old Baghdad," a suburb chiefly occupied by Shiâs, on the right bank. Here stood the "Round City" founded by Mansûr in A.D. 762, with its three concentric walls, enclosing as a central point the palace and mosque of the Khalif, and its four equi-distant

gates. Of this city no trace remains; walls and houses have been destroyed by civil war and fire, or have been swept away by inundations.

The exact position of Mansûr's palace is unknown, but it seems certain that the tomb of Zobeide was near the river at Kazimîn and not where now shown. Eastern Baghdad has no distinctive architectural character. Little remains of the great buildings of the khalifs, and there is nothing imposing in the barracks, bazârs, khans, and narrow winding streets. The old city walls of brick have been demolished except in a few places; but the great fosse remains, and a line of mounds marks the position of the glacis. Baghdad is unrivalled for position and fertility of soil, and under better government would regain its former prosperity. Many improvements were introduced by Midhat Pasha. Barracks and schools were built, a tram-way was laid down to the Shiâ shrines at Kazimîn, trade was encouraged, and the nomads were brought under control. But no effort has been made to restore the old system of canalization which made the country between the Euphrates and Tigris a continuous garden. A Turkish and an English company run steamers from Baghdad to Basra, but the state of the Tigris has become a source of anxiety. No steps are taken to stop the outflow of water to the desert and the marshes, and the main channel becomes almost unnavigable during August and September. Above Baghdad sailing vessels of about 30 tons are employed. The exports and imports pass chiefly through Basra. Population, according to Cuinet, 145,000, but this is probably an exaggeration. Baghdad is the seat of a British consul-general.

G. LE STRANGE. "Description of Mesopotamia and Baghdad about A.D. 900; and Greek Embassy to Baghdad in A.D. 917," in *Journal Royal Asiatic Society*, 1895, 1897; *Baghdad under the Abbasid Caliphate*, 1901.

(C. W. W.)

Baghelkhand, or BHAGELKHAND, a tract of country in Central India, lying between the North-West and the Central Provinces, east of Bundelkhand. It takes its name from the Baghel clan of Rajputs, now represented by the Maharaja of Rewa. Politically, it consists of five native states under the Baghelkhand agency, of which Rewa is by far the most important. The total area is 11,324 square miles. Population (1891), 1,737,095, being an average of 153 persons per square mile; (1901), 1,554,577, showing a decrease of 11 per cent., due to the effects of famine. The country is for the most part hilly, and the soil is poor.

Bagheria, or BAGARIA, a decaying town of the province of Palermo, Sicily, 8 miles by rail E. by S. from Palermo. It contains palaces of Sicilian magnates, and has manufactures of macaroni, preserved food, olive oil, and casks. Under the Bourbon kings (first half of 19th century) it was a favourite seaside resort. Population, about 11,600.

Bagirmi. See CHAD, LAKE.

Bagnara, a town of the province of Reggio, Calabria, Italy, 20 miles N. by E. from Reggio by rail. It was founded by Robert Guiscard in the 11th century, but suffered severely from the earthquake of 1783. It has tunny and swordfish fishing. Population, about 10,000.

Bagnolet, a town in the arrondissement of Saint-Denis, department of Seine, France, $\frac{1}{2}$ mile E. of the outer circle of Paris. Market gardening is extensively carried on, and the manufacture of billiard balls, perfumery, fancy soaps, and glue are the principal industries. Population, 7100.

Bago, a town of 16,000 inhabitants on the eastern coast of Cebu, Philippine Islands, near its northern extremity. The climate is hot, but healthful. The surrounding country is fertile, producing rice, cacao, and hemp in abundance. Sinamay and guinara cloths are woven and exported to a limited extent. The fisheries are of considerable local importance. The language is Cebu-Visayan.

Bahamas, or LUCAYOS, an extensive archipelago of the British West Indies, which recent surveys (1870-90) show to consist of 12 large islands, 661 islets or cays

(keys) as they are called, and 2387 banks, reefs, and rocks above the surface of the water, all but thirty uninhabited. They all rise on the margin of large coral banks, and are themselves exclusively of coralline formation, with a mean elevation of 100 feet, but rising here and there to 300 or even 400 feet above the sea. They are disposed in the direction from north-west to south-east, extending from Florida along the *Great Bahama Bank* for a distance of about 780 miles to Turks islets north of San Domingo. They have a collective area of 5450 square miles, with a population which was returned in 1891 at 47,564 (about 12,000 white, the rest coloured), and was estimated in 1900 at about 60,000. The largest and most important members of the group, following in the normal direction from north-west to south-east, are:—Bahama, which gives its name to the archipelago; Great Abaco, Eleuthera, New Providence, Andros, Cat Island, Watling, Yuma, Acin, Mariguana, The Caicos (North, Grand, and East), Inagua (Great and Little), and Turks. Cat (Guanahani), the highest land in the group (400 feet), was long supposed to be the island which was first reached by Columbus (12th October 1492), and was named by him San Salvador. Then the distinction was successively transferred to the neighbouring Watling, Great Turk, and Mariguana; but in 1880 the American marine surveyor, G. V. Fox, identified San Salvador, on seemingly good grounds, with Samana (Atwood Cay), which lies about midway between Watling and Mariguana. The chief difficulty is its size, for if Samana is the true San Salvador, it must have been considerably larger 400 years ago than it now is. The Bahamas are unaffected by the depressed state of the sugar market in so many other West Indian groups, the chief produce being fruits (principally oranges), hemp fibre, sponges, salt, and some cotton. The salt and sponge latterly seem to be dying out, while fruit cultivation is on the increase. The imports rose from £195,000 in 1896 to £238,000 in 1898, and the exports from £139,000 to £175,000 in the same period. The revenue in 1896, £65,000, and 1898, £87,000; expenditure (1896), £60,000; (1898), £64,000; debt (1900) £118,400. The total trade with America is nearly four times that with Great Britain. Trade with British Colonies or with other countries than America and the United Kingdom is quite insignificant. A number of visitors from America and Canada come every year to winter in the Bahamas. The total tonnage of vessels, inwards and outwards, was 741,522 in 1898. There has been rapid increase of late years owing to steamers calling on their way to and from the ports of the Gulf of Mexico to engage and to re-land labourers. There is regular fortnightly mail communication with New York and Cuba, and frequent sailing vessels to and from Cuba and Key West. The extent of Crown lands is estimated at 500,000 acres, lying chiefly in the islands of Inagua, Andros, Grand Bahama, and Abaco, but little of this is serviceable for cultivation. There are 44 Government schools, with 5998 pupils on the register, and 4050 in average attendance in 1898. There are 11 schools which receive grants-in-aid, besides others, independent of such aid, belonging chiefly to the Anglican Church body. There are no railways or telegraphs, and but few roads, except in New Providence. Cable communication with the United States was established in 1892. There are no regular forces, militia, or volunteers. The constabulary is a semi-military force, originally enlisted in Barbados, but recruited at times in the Bahamas.

(A. H. K.)

Bahawalpur, a native state of India, within the Punjab, stretches for more than 300 miles along the left bank of the Sutlej, the Punjnad, and the Indus, and is

bordered on the other side by the desert of Rajputana. The area covers 17,285 square miles; in 1881 the population was 573,494; in 1891 it was 650,042 (average density, 38 persons per square mile); in 1901, 720,662, showing a further increase of 11 per cent. The estimated gross revenue is Rs.16,00,000; the military force (including police) is 1607 men. There is no tribute. The chief, whose title is Nawab, is a Mahommedan of the Daudputra family from Sind. The dynasty established its independence of the Afghans towards the end of the 18th century, and made a treaty with the British in 1838, to which it has always been loyal. The benefits of canal irrigation were introduced during the minority of the late Nawab, and the revenue thus doubled. The territory is traversed throughout its length by the North-Western and Southern Punjab railways. In 1896-97 the total number of schools was 487, with 5828 pupils, of whom 721 were girls; the proportion of boys at school to the total male population was 1 in every 61. There are an arts college, and 7 Anglo-vernacular schools, with 856 pupils.

The town of BAHAWALPUR is situated near the left bank of the Sutlej; railway station 63 miles from Mooltan. It has a magnificent palace. Population, 13,635.

Bahia, an Atlantic state of Brazil between 9° 55' and 18° 15' S. lat. and 37° 40' and 39° 40' W. long. Its area covers 164,640 square miles. Its population in 1890 was 1,919,800, and in 1897 was estimated at 1,822,000. The chief towns are Bahia or S. Salvador, the capital, and Alagoins (12,000), Bom-Fim (14,000), Feira de Sant Anna (16,000), Maragogipe (13,000), Santo Amaro (11,000), Jacobina (9000), Ilhéos (6000), Cachoeira (9200), Barra do Rio Grande. There are over 70 towns in the state. Railways run from Bahia to Joazeiro on the northern border of the state and thence to other localities beyond; from Nazareth to Maragogipe; from Amaro to near the port of Abbadia; from Caravellas to Serra dos Aymores. Others are in construction. The capital, BAHIA or SAN SALVADOR, is a seaport with a population estimated at between 180,000 and 200,000. The port was visited in 1896 by 1045 ships of 1,538,881 tons, in 1897 by 1028 ships of 1,533,078 tons, and in 1898 by 881 ships of 1,504,797 tons. The value of the exports in 1897 was £1,519,930. The principal articles of export were coffee, tobacco, cacao, sugar, rosewood, logwood, and hides.

Bahraich, a town and district of British India, in the Faizabad division of Oudh. The town is on the river Sarju. Since the opening of the railway the place has begun to flourish. It contains the most popular place of pilgrimage in Oudh, the tomb of Masaud, a champion of Islam, slain in battle by the confederate Rajputs in 1033, which is resorted to by Mahommedans and Hindus alike. There is also a Mussulman monastery, and the ruined palace of a nawab of Oudh. The American Methodists have a mission here. Population, about 24,000.

The district of BAHRAICH lies between the Tarai of Nepal and the river Gogra. It contains an area of 2680 square miles. The population in 1891 was 1,000,432, being 373 persons per square mile; classified according to religion, Hindus numbered 830,459, Mahommedans 169,798, Christians 124, including 28 Europeans, "others" 51. In 1901 the population was 1,051,856, showing an increase of 5 per cent. Land revenue and rates are returned as Rs.10,93,737, the incidence of assessment per acre being Rs.0:9:4 on the temporarily settled, and Rs.0:15:7 on the permanently settled area; the number of police was 2820. In 1896-97, out of a total cultivated area of 919,844 acres, 60,975 were irrigated from tanks, wells, &c. A considerable trade is conducted with Nepal, chiefly

in timber. A line of railway has been opened through the district to Nepalganj on the frontier.

Bahrein Islands.—The Bahreins include a group of islands situated about 20 miles east of the coast of Al Hasa, in the Persian Gulf, a little to the south of the port of Al Katif, which, under the ancient name of Gerrha, has been celebrated throughout history as the mart of Indian trade, the starting-point of caravans across Arabia. The largest of the group is called Bahrein. It is about 27 miles long from north to south and about 10 wide—a low flat space of sandy waste with cultivated oases and palm groves of great luxuriance and beauty. The rocky hill of Jebel Dukhan (the "mountain of the mist") rises in the midst of it to a height of 400 feet. The rest of the group are of coral formation. The next island in size to Bahrein is Moharek, curved in shape, and about 5 miles long by $\frac{1}{2}$ mile in breadth. It lies 1 mile to the north of Bahrein. Sitrah (4 miles long) Nebbi, Saleh, Sayeh, Khasifeh, and Arad ($\frac{3}{4}$ mile long) complete the group. Of these minor islands Arad alone retains its classical name.

The sea around the Bahrein islands is shallow, so shallow as to admit only of the approach of native craft, and the harbour is closely shut in by reefs. There is very little doubt that it was from these islands that the Puni, or Phoenicians, emigrated northwards to the Mediterranean. Bahrein has always been the centre of the pearl fishing industry of the Persian Gulf. There are about 400 boats now employed in the pearl fisheries, each of them paying a tax to the Sheikh. The pearl export from Linja is valued at about £30,000 to £35,000 per annum.

The capital town of Bahrein is *Manameh*, a long, straggling, narrow town of about 8000 inhabitants, chiefly of the Wahabi sect. Manameh is adjacent to the most northern point of the island, and looks across the narrow strait to Moharek.

Fish and sea-weed form the staple food of the islanders. The water-supply of Moharek is probably unique. It is derived from springs which burst through the beds below sea-level with such force as to retain their freshness in the midst of the surrounding salt water. Scattered through the islands are some fifty villages, each possessing its own date groves and cultivation, forming features in the landscape of great fertility and beauty. Most of these villages are walled in for protection.

The present Sheikh of Bahrein (who lives chiefly at Moharek) is of the family of El Kalifa which furnishes chiefs to the Uttubi tribe. This ruling race was driven from the mainland (where they held great possessions) by the Turks about 1850. In the year 1867 the Persians threatened Bahrein, and in 1875 the Turks laid their hands on it. British interference in both cases was successful in maintaining the integrity of Arab rule, and the Bahrein Islands are now under British protection.

To the south-west of the picturesque belts of palm trees which stretch inland from the northern coast of Bahrein, is a wide space of open sandy plain filled with gigantic tumuli, or earth mounds, of which the outer layers of gravel and clay have been hardened by the weather action of centuries to the consistency of conglomerate. Within these mounds are two-chambered sepulchres, built of huge slabs of limestone, several of which have been opened and examined by Durand, Bent, and others, and found to contain relics of undoubted Phœnician design. Scattered here and there throughout the islands are isolated mounds, or smaller groups, all of which are of the same appearance, and probably of similar origin.

See Bent, vol. xii. *Proceedings R. G. S.* (T. H. H. *)

Bahr-el-Ghazal. See SUDAN, NILE, and EGYPT.

Baiburt, chief town of a district of the Erzerüm vilâyet of Asiatic Turkey, altitude 5114 feet, situated on both banks of the Choruk Su (*Acampsis*), at the point where the Trebizond-Erzerüm road crosses that river. The town is dominated by an old Armenian fortress on an isolated mass of rock. Population, 10,000 (Moslems, 8500; Christians, 1500).

Baikal, a lake of Russia, East Siberia, the sixth in size of all the lakes of the world and the largest fresh-water basin of Eurasia. It has the shape of a narrow

crescent, which spreads from S.W. to N.E. (51° 29' to 55° 50' N. lat. and 103° to 110° E. long.) separating the province of Irkutsk from Transbaikalia, and has a length of 376 miles and a width of from 20 to 70 miles. Its south-western extremity penetrates into the high plateau of East Asia, and the lake lies entirely in the Alpine zone which fringes the plateau from the north-west. Its area is 13,500 square miles, *i.e.*, nearly as great as Switzerland. The length of its coast-line is 525 miles along the western, and 640 along the eastern shore. Its altitude is now estimated by Russian geographers at 1587 and at 1651 feet—90 feet above the level of the Angara at Irkutsk—both figures being derived from a levelling accomplished in the 'seventies across Siberia (*Zapiski, Russ. Geog. Soc., Gen. Geogr.* xv. 1885); but owing to errors which have crept into that levelling between Krasnoyarsk and Irkutsk, these altitudes seem to be exaggerated and 1500 feet (1433 feet for Irkutsk) would seem a more correct altitude (*Izvestia, East Sib. Branch*, xxviii. 1, 1897). Its level is subject to slight oscillations, and after the heavy five weeks' rains of 1869, it rose by 7 feet, an immense territory at the mouth of the Selenga being submerged.

The elongated hilly island of Olkhon and the peninsula Svyatoi Nos which rises as its continuation on the opposite eastern shore, divide the lake into two basins. Careful soundings show that the deepest part of the lake is in the south-west, at the foot of the Khamar-daban border-ridge of the high plateau. An elongated cavity, 66 miles long, reaches there a depth of over 600 fathoms, with a maximum depth of 791 fathoms, *i.e.*, about 3240 feet below the level of the ocean. The bottom of the lake has very steep slopes as a rule, the 100- and even the 250-fathom lines running close to the shores. Only at the mouth of the Selenga, which is a mighty stream 800 miles long, entering the lake from the south-east, and pouring into it the waters and the deposits from a drainage area of 173,500 square miles, a wide delta protrudes into the lake, reducing its width to 20 miles and spreading under its waters, so as to leave only a narrow channel, 230 to 247 fathoms deep, along the opposite coast.

The depths of the middle portion of the lake have not yet been measured but must exceed 500 fathoms. It was expected that an underground ridge would be found connecting Olkhon with Svyatoi Nos; but depths exceeding 622 fathoms were found even along that line. As to the northern basin, the configuration of its bottom is in accordance with the high mountains which surround it, and most of its area has a depth exceeding 400 fathoms, the maximum depths along three lines of soundings taken across it being 491, 485 and 476 fathoms respectively.

Temperature.—The surface-layers of this immense basin are heated in the summer along the coast so as to reach temperatures of from 55° to 67° Fahr. both close to the shores and at some distance from the mouth of the Selenga; but these warmer layers are not thick and a uniform temperature of nearly 39° F. is generally found at a depth of 20 fathoms, as also on the surface in the middle of the lake. At a depth of 500 fathoms there is a nearly uniform temperature of 38° from top to bottom. The lake freezes usually at the end of December or in the beginning of January, so solidly that a temporary post-horse station is erected on the ice in the midst of the lake, and it remains frozen till the second half of May. The evaporation from this large basin exercises a certain influence on the climate of the surrounding country, while the absorption of heat for the thawing of the ice has a notable cooling effect in early summer.

Rivers.—Lake Baikal receives over 300 streams, mostly short mountain torrents, besides the Upper Angara, which enters its north-east extremity, the Barguzin on its east shore, and the Selenga from the south-east. Its only outflow is the Lower Angara, which issues through a rocky cleft on the west shore. The Irkut reaches the Baikal no more. After approaching its south-west extremity it abandons the broad valley which leads to the lake and makes its way northwards through a narrow cleft, pierced in high mountains, to join the Angara at Irkutsk.

Mountains.—With the exception of the delta of the Selenga, lake Baikal is surrounded with high mountains. The Khamar-daban border-ridge (the top of a mountain of the same name is 5300 feet above the lake) falling with steep cliffs towards the lake, fringes it in the south; a massive, deeply ravined highland occupies the space between the Irkut and the Angara; the Onot and Baikal ridges (also Primorskiy) run along its north-west shore, reaching it in a diagonal direction; an Alpine complex of yet unexplored mountains spreads along its north-east shore; the Barguzin range reaches its shores in an oblique direction in the east, and the Ulan Burgasu mountains appear in the delta of the Selenga.

Geology.—It is certain that in previous geological ages lake Baikal had a much greater extension. It spread westwards into the Tunka valley of the Irkut, and up the lower portions of the valleys of the Upper Angara and the Barguzin. Volcanic activity took place around its shores at the end of the Tertiary or during the Quaternary age, and mighty streams of lava cover the Sayan and Khamar-daban mountains, as well as the Tunka valley. Earthquakes are still frequent along its shores. The researches of Meglitzky (1851) and Chersky (1875) have proved that the northern portion of Baikal is a diagonally-running transversal rift which was made in the Laurentian schists and slates, whose synclinal and anticlinal plications run from south-west to north-east, crossing in an oblique direction the present axis of the lake; while its southern portion has the character of a longitudinal valley, immensely modified by erosion and running between the outer foot of the border-ridge of the high plateau and the Alpine zone which fringes it. The mountains around lake Baikal (granites, syenites, gneisses, and various crystalline schists, conglomerates and limestones) belong chiefly to the Laurentian, Huronian, Cambrian, and Silurian ages—red Devonian sandstones (Silurian, according to Baron Toll?) lying in nearly horizontal layers at the outer foot of the Onot and Baikal ranges. Jurassic and Tertiary deposits of fresh-water origin occur in the old valleys. Gold is found at its northern extremity, and beautiful lapis-lazuli, baikalite, and some graphite on the slopes of the Khamar-daban, near Kultuk.

Fauna.—The fauna of lake Baikal, explored by Dybowski and Godlewski, is much richer than it was supposed to be, and has quite an original character; but hypotheses as to a direct communication having existed between lake Baikal and the Arctic Ocean during the Post Tertiary or Tertiary ages, are not proved. Still, lake Baikal has a seal (*Phoca vitulina*, *Phoca baikalensis* of Dybowski) quite akin to the seals of Spitzbergen. The waters of the lake swarm with fishes (sturgeons, salmonidae), and its herring (*Salmo omul*) yields the chief product of the fisheries, about 11,000 casks every year. Its quantity, however, notably diminished within the last forty or fifty years. The little lake Frolikha, situated close to lake Baikal near its northern extremity and communicating with it by means of a river of the same name, is interesting on account of the species of trout, *Salmo erythreus*, which is found in it but is not known elsewhere.

Navigation.—Navigation on lake Baikal is rendered difficult both by sudden storms and by the absence of good bays and ports. The main port on the western shore, Listvenichnaya, near the outflow of the Angara, is an open roadstead at the foot of high mountains. Steamers ply from it thrice a week to Posolskoye, on the opposite shore, five times a year to Verkhne-Angarsk, at the northern extremity of the lake, and frequently to the mouth of the Selenga which becomes an important artery of trade. Steamers go up that river to Bilyutai, near the Mongolian frontier, and bring back nearly 6660 tons of tea, out of the 16,500 tons imported *via* Kiakhta, while nearly 5000 tons of grain, cedar nuts, salt, soda, wool, and timber are shipped on rafts down the Khilok, Chikoi, and Uda (tributaries of the Selenga), and about 1000 tons of manufactured goods are taken up the river for export to China. Ten steamers ply on lake Baikal and three on the Selenga. Besides, attempts are being made to render the Angara navigable below Irkutsk down to the Yenisei. In winter, when the lake is covered with a crust of ice three to four feet thick, it is crossed on sledges from Listvenichnaya to Posolskoye. The lake offering, nevertheless, a serious interruption on the main road which leads through Siberia to the Amur, a highway, available all the year round, was made in 1863-64 around its southern shore, partly by piercing the cliffs falling to the lake. It will be followed by the trans-Siberian railway, notwithstanding the considerable difficulties offered by a great number of streams wildly rushing to the lake from the Khamar-daban. In the meantime, a powerful protected ice-breaker (3750 horse-power, 4200 tons) will carry over the trains (up to twenty-five carriages) from Listvenichnaya to the head of the Transbaikalian railway at Posolskoye.

Towns.—The shores of the lake are thinly populated. The chief villages are Listvenichnaya, Posolsk monastery and Posolskoye, Verkhne-Angarak at the north-eastern extremity, Kultuk at the south-western extremity, and several villages in the delta of the Selenga.

Bailey, Philip James (1816—), English poet, author of *Festus*, was born at Nottingham, 22nd April 1816. His father, who himself published both prose and verse, owned and edited from 1845 to 1852 *The Nottingham Mercury*, one of the chief journals in his native town. Philip James Bailey received a local education until his sixteenth year, when he matriculated at Glasgow University. He did not, however, take his degree, but moved in 1835 to London, and entered Lincoln's Inn. Without making serious practice of the law he settled at Basford, and for three years was occupied with the composition of *Festus*, which appeared anonymously in 1839. Its success, both in England and America, was immediate. It passed through a dozen editions in the country of its birth, and nearly three times as many in the United States; and when in 1889 its author was able to publish a "Jubilee Edition" he could feel that it was one of the few poems of its time which was known to both the older and younger generations. Its author is known almost exclusively by his one voluminous poem, for though Bailey published other verses he is essentially a man of one book. *Festus* has undergone many changes and incorporations, but it remains a singular example of a piece of work virtually completed in youth and never supplanted or reinforced by later achievements of its author. It is a vast pageant of theology and philosophy, comprising in some twelve divisions an attempt to represent the relation of God to man and of man to God, to emphasize the benignity of Providence, to preach the immortality of the soul, and to postulate "a gospel of faith and reason combined." It contains fine lines and dignified thought, but its extraordinarily ambitious theme, and a certain incoherency in the manner in which it is worked out, prevent it from being easily readable by any but the most conscientious and most sympathetic student.

Baillieston, a large mining village of Old Monkland parish, Lanarkshire, 6½ miles E. of Glasgow by rail. There are 13 collieries at present working in the vicinity, with a daily output of 4300 tons, and employing 3000 men. There is a large nursery and market garden. Population (1881), 2927; (1891), 4026; (1901), 5151.

Bain, Alexander (1818—), Scottish logician and philosopher, was born in Aberdeen, 11th June 1818, and received his early education there. In 1836 he entered Marischal College, the younger of the two universities that had then a separate existence in Aberdeen; and, while a student, he came under the influence of Professor John Cruickshank, who held the Chair of Mathematics, and of Dr William Knight, who was Professor of Natural Philosophy—from each of whom he received a considerable impetus. His college career was very distinguished, especially in the departments of mental philosophy, mathematics, and physics. Towards the end of his arts course he became a contributor to the *Westminster Review*, and thereby came into contact with John Stuart Mill. This was the beginning of his connexion with Mill, which was to lead to a life-long friendship. In 1841 he became substitute for Dr Glennie, the Professor of Moral Philosophy,

who, through ill-health, was unable to discharge the active duties of the chair. This post he occupied for three successive sessions, during which time he continued writing for the *Westminster*, and also in 1842 helped Mill with the revision of the MS. of his *System of Logic*, giving special aid in the province of Induction, and supplying many of the more important examples of the experimental methods. In 1844, when the chair of Natural Philosophy was vacant through the death of Dr Knight, he filled the gap until the appointment of a new professor. He was unsuccessful in his application for the chair; but, in 1845, he was appointed Professor of Mathematics and Natural Philosophy in the Andersonian University of Glasgow. This he did not long retain, but, preferring a wider field, resigned the position and devoted himself to literary work, partly in connexion with the magazines, but still more in the production of scientific manuals and philosophical articles for Messrs Chambers of Edinburgh. In 1848 he removed to London to fill a post in the Board of Health under Edwin Chadwick. While resident in London he was a member of the brilliant coterie that included George Grote and John Stuart Mill, and was associated with them in the leading political, social, and intellectual movements of the time. In 1855 he published his first large work, *The Senses and the Intellect*, which was followed in 1859 by *The Emotions and the Will*. Through these two treatises his place as an independent thinker was assured. This led in 1860 to his appointment by the Crown, on the recommendation of the then Home Secretary, Sir G. Cornewall Lewis, to the chair of Logic and English in the University of Aberdeen. That chair had just been created, on the amalgamation of the two universities (King's and Marischal) by the Scottish Universities Commission of 1858; and Mr Bain became its first occupant. In his new capacity he had a twofold work to perform. Up to this date neither Logic nor English had received adequate attention in Aberdeen, and now was the opportunity for furthering the interests of both. Mr Bain threw himself with great energy into the task. Not content with shaping lectures for his class, he set to work by published writings to instruct the outside world also; and in this way he succeeded not only in raising the standard of education in the north of Scotland, but also in forming a school of philosophy, and in widely influencing the teaching of English grammar and of composition. His efforts were first directed to the English part of his charge. This resulted in the publication of the *Higher English Grammar* in 1863, followed in 1866 by the *Manual of Rhetoric*, in 1872 by *A First English Grammar*, and in 1874 by the *Companion to the Higher Grammar*. These works covered a large field, and by their original views and new methods aroused much interest, and met with wide acceptance in the scholastic world. But the other subject of his chair also called for attention. No doubt his own philosophical writings already published, especially *The Senses and the Intellect* (to which was added, in 1861, *The Study of Character*), were ready to hand for the purposes of prelection; but the volumes were too large for effective use in the class-room. A psychological handbook was needed, for there was hardly anything of that stamp in existence, certainly nothing at all satisfactory. Accordingly, in 1868, he published his *Manual of Mental and Moral Science*, mainly a condensed form of his own larger philosophical treatises, but with the doctrines re-stated, and in many instances freshly illustrated, and with many important additions, chiefly in the shape of chapters on the history of the intellectual controversies (universals, sense-perception, &c.), and of a recasting of the ethical positions, and an elaborate analysis of the leading systems of Ethics, ancient and modern. The year 1870 saw the publication of the

Logic. This, too, was a work designed specially for the use of students, based on Mill, but differing from him in many particulars, and having as distinctive features the treatment of the doctrine of the conservation of energy in connexion with causation and the detailed application of the principles of logic to the various sciences. After the publication of the *Logic*, his eminent services to education in Scotland were recognized by the conferment of the honorary degree of Doctor of Laws by the University of Edinburgh in 1871. Next came two publications in "The International Scientific Series," namely, *Mind and Body* (1872), and *Education as a Science* (1879). The first of these is a re-statement of Mr Bain's intellectual system, with an appended chapter on the history of the conception of the Soul; and the second carries the principles of psychology with great thoroughness into the province of teaching.

All these works, from the *Higher English Grammar* downwards, were written by Mr Bain during his twenty years' occupancy of the chair of Logic in the University of Aberdeen. To the same period belongs his institution of the philosophical journal *Mind*; the first number of which appeared in January 1876, under the editorship of a former pupil and attached disciple, Professor G. Croom Robertson of University College, London. To this journal Mr Bain contributed many important articles and discussions; and he continued sole proprietor of it till Robertson, owing to ill-health, resigned the editorship in 1891, when it passed into other hands. Feeling the burden of the teaching work as years advanced, Dr Bain resigned his professorship in 1880. This did not, however, mean cessation of intellectual activity or of productive energy. On the contrary, his interest in thought and his desire to complete the scheme of work which he had mapped out for himself in earlier years remained as keen as ever. Accordingly, in 1882 appeared the *Biography of James Mill*, and accompanying it *John Stuart Mill: A Criticism, with Personal Recollections*. Next came (1884) a collection of articles and papers, most of which had appeared in magazines, under the title of *Practical Essays*. This was succeeded in 1887 by the first volume of the new edition of the *Rhetoric*, devoted to the handling of the Intellectual qualities of style, and, along with it, a book *On Teaching English*, being an exhaustive application of the principles of rhetoric to the criticism of style, for the use of teachers. The following year the second volume of the new *Rhetoric* appeared, dealing with the Emotional qualities of style. This completed, attention was next directed to a revision of *The Senses and the Intellect*, which resulted in the fourth edition of the work, published in 1894, in which may be found Dr Bain's last word on psychology; for, although a new edition of *The Emotions and the Will* was brought out in 1899, the author's physical condition did not permit of any recasting of the treatise such as had been accorded to the companion volume.

Dr Bain's life has been mainly that of a thinker and a man of letters. But he is also so far a man of affairs that he has always taken a keen interest, and frequently an active part, in the political and social movements of the day; and so highly did the students of Aberdeen rate his practical ability that, after his retirement from the chair of Logic, they twice in succession elected him Lord Rector of the University, each term of office extending over three years. This was no mere compliment to a former professor, of whom they were naturally proud, but a deliberate selection of the man whom they believed best able to guide the affairs of the university as head of its superior court. Being the acknowledged leader of the Progressive party, he was all on the side of reform, pushing forward the interests of science, and strenuously advocating, in the face of much

opposition, the recognition of the claims of the modern languages to a place in the academic curriculum. In like manner, the vast amount of work that Dr Bain did for the community as a member of the first School Board, and in connexion with the management first of the Mechanics' Institute, and next of the Free Public Library, shows him to be no mere recluse. It was in appreciation of his services of this kind that the people of Aberdeen placed a marble bust of him in the Public Library—just as his former pupils, in gratitude for the inspiration of his teaching, have presented a portrait of him in his rectorial robes, painted by Sir George Reid, to the university, to be hung in the picture gallery of Marischal College.

Wide as Professor Bain's influence has been as a logician, a grammarian, and a writer on rhetoric, his greatest reputation rests on his psychology. At one with Johannes Müller in the conviction *psychologus nemo nisi physiologus*, he was the first in Great Britain during the 19th century to apply physiology in a thoroughgoing fashion to the elucidation of mental states, and thereby to advance the science of mind at a bound. His happy idea of applying the natural history method of classification to psychical phenomena further gave scientific character to his work, the value of which was still more enhanced by the author's faculty of methodical exposition and his exceptional command of felicitous illustration. In line with this, too, is his rigorous demand that psychology shall be cleared of metaphysics; and to his lead is no doubt due in great measure the position that psychology has now acquired as a distinct positive science. Although his work pre-dated the psycho-physical developments of the present day, these are all in the exact spirit of it; and although he has from the beginning strongly and consistently advocated the supremacy of the introspective method in psychological investigation, he was among the first to appreciate the help that may be given to it by animal and social and infant psychology as subsidiary adjuncts. He may justly claim the merit of having effectively guided the awakened psychological interest of British thinkers of the second half of the 19th century into fruitful channels. Nor will any just estimate of his work ignore the subtlety and suggestiveness of his analyses; or his masterly handling of the laws of Association, alike penetrating and exhaustive, bold in the application of them to each and every province of mind—intellectual, emotional, and volitional. These mark him off among psychologists, and determine his place in the history of philosophy.

Bainaluka, or BANJALUKA, a town of Bosnia, Austria-Hungary, situated on the Vrbas, on the borders of a plain fronting the entrance to a narrow defile, at the terminus of a railway line from Sunja, from which by rail it is distant 85 miles S.E. Among the mosques the most notable is the Feradija-Djami, dating from the end of the 16th century. On the right bank of the Vrbas are the ruins of the ancient citadel. There are powder mills and cloth factories, and also a Government tobacco factory. Borings have lately been made by the Government in the neighbouring coal-fields. Bainaluka, under the name of Servitium, was a Roman military station. The population is 13,666, of whom the majority are Mahomedans.

Baindir, a town in Asiatic Turkey, in the Aidin, Smyrna, vilâyet, situated in the valley of the Kuchuk Mendere (ancient *Caystrus*). It is connected with Smyrna by railway, and has a trade in cotton, figs, raisins, and tobacco. Population, 10,000 (Moslems, 7500; Christians, 2500).

Baird, Spencer Fullerton (1823-1887), American scientist, was born in Reading, Pennsylvania,

3rd February 1823. He graduated at Dickinson College, Carlisle, Penn., in 1840. The next year, when eighteen years old, he made an ornithological excursion through the mountains of Pennsylvania, walking, says one of his biographers, "400 miles in twenty-one days, and the last day sixty miles." In 1838 he met Audubon, and thenceforward his studies were largely ornithological, Audubon giving him a part of his own collection of birds. After studying medicine for a time, Baird became professor of natural history in Dickinson College, assuming likewise the duties of the chair of chemistry, and meanwhile giving instruction in physiology and mathematics. This variety of duties, in a small college, tended to give him that breadth of scientific interest which characterized him through life, and made him perhaps the most representative general scientist in America. For the long period between 1850 and 1878 he was assistant-secretary of the Smithsonian Institution, Washington, and on the death of Joseph Henry, in the latter year, he became secretary. While an officer of the Smithsonian, Baird's duties consisted, in large part, of the gathering of information from many fields, and the superintendence of the labour of workers in widely different lines. Thus, apart from his assistance to others, his own studies and published writings cover a broad range: iconography, geology, mineralogy, botany, anthropology, general zoology, and, in particular, ornithology; while for a series of years he edited an annual volume summarizing progress in all scientific lines of investigation. He gave general superintendence, between 1850 and 1860, to several Government expeditions for scientific exploration of the western territories of the United States, preparing for them a manual of *Instructions to Collectors*, and enlisting the collaboration even of such army officers as Scott, McClellan, and Thomas, as well as of officers in the navy. Of his own publications, the bibliography by G. Brown Goode, from 1843 to the close of 1882, includes 1063 entries, of which 775 were short articles in his *Annual Record*. His most important volumes, on the whole, were *Birds*, in the series of reports of explorations and surveys for a railway route from the Mississippi river to the Pacific ocean (1858), of which Dr Elliott Coues says (as quoted in the *Popular Science Monthly*, xxxiii. 553), that it "exerted an influence perhaps stronger and more widely felt than that of any of its predecessors, Audubon's and Wilson's not excepted, and marked an epoch in the history of American ornithology"; *Mammals of North America: Descriptions based on Collections in the Smithsonian Institution* (Philadelphia, 1859); and the monumental work (with Thomas Mayo Brewer and Robert Ridgway) *History of North American Birds* (Boston, 1875-84; "Land Birds," 3 vols., "Water Birds," 2 vols.). He died 19th August 1887, at the great marine biological laboratory at Wood's Holl, Massachusetts, an institution largely the result of his own efforts, and one which has exercised a wide effect not only upon scientific but upon economic ichthyology. (C. F. R.)

Bajaor, a small district peopled by Pathan races of Afghan origin, about 45 miles long by 20 broad, lying at a high level to the east of the Kunar valley, from which it is separated by a continuous line of rugged frontier hills forming a barrier easily passable at one or two points. Across this barrier the old road from Kabul to India ran, before the Khaibar was adopted as the main route. To the south of Bajaor is the wild mountain district of the Mohmands, an Afghan race. To the east, beyond the Panjkora river, are the hills of Swat, dominated by another Afghan race. To the north is an intervening watershed between Bajaor and the small state of Dir; and it is over this watershed and through

the valley of Dir that the new road from Malakand and the Punjab runs to Chitral. The drainage of Bajor flows eastwards, starting from the eastern slopes of the dividing ridge which overlooks the Kunar and terminating in the Panjkora river, so that the district lies on a slope tilting gradually downwards from the Kunar ridge to the Panjkora. Nawagai is the chief town of Bajor, and the Khan of Nawagai is under British protection for the safeguarding of the Chitral road. Jandul, one of the northern valleys of Bajor, has ceased to be of political importance since the failure of its chief, Umra Khan, to appropriate to himself Bajor, Dir, and a great part of the Kunar valley. It was the active hostility between the Amir of Kabul (who claimed sovereignty of the same districts) and Umra Khan that led, firstly to the demarcation agreement of 1893 which fixed the boundary of Afghanistan in Kunar; and secondly to the invasion of Chitral by Umra Khan (who was no party to the boundary settlement) and the siege of the Chitral fort in 1895.

An interesting feature in Bajor topography is a mountain spur from the Kunar range, which curving eastwards culminates in the well-known peak of Koh-i-Mor, which is visible from the Peshawur valley. It was here, at the foot of the mountain, that Alexander found the ancient city of Nysa and the Nysæan colony, traditionally said to have been founded by Dionysos. The Koh-i-Mor has been identified as the Meros of Arrian's history—the three-peaked mountain from which the God issued. It is also interesting to find that a section of the Kafir community of Kamdesh still claim the same Greek origin as did the Nysæans; still chant hymns to the god who sprang from Gir Nysa (the mountain of Nysa); whilst they maintain that they originally migrated from the Swat country to their present habitat in the lower Bashgol. Long after Buddhism had spread to Chitral, Gilgit, Dir, and Swat; whilst Ningrehar was still full of monasteries and temples, and the Peshawur valley was recognized as the seat of Buddhist learning, the Kafirs or Nysæans held their own in Bajor and in the lower Kunar valley, where Buddhism apparently never prevailed. It is probable that the invader Babar (who has much to say about Bajor) fought them there in the early years of the 16th century, when on his way to found the Turk dynasty of India centuries after Buddhism had been crushed in Northern India by the destroyer Mahmud.

The Gazetteers and Reports of the Indian Government contain nearly all the modern information available about Bajor. The Autobiography of Babar (by Leyden and Erskine) gives interesting details about the country in the 16th century. For the connexion between the Kafirs and the ancient Nysæans of Swat, see *R. G. S. Journal*, vol. vii. 1896.

(T. H. H.*)

Baker, a city of Oregon, U.S.A., capital of Baker county, in the eastern part of the State, in the valley of the Powder river, at the east base of the Blue Mountains, and on the Oregon Railroad and Navigation Co. Railway. It is a supply-point for the mines in these mountains and those in the Wallowa range, to the north-east. Population (1880), 1258; (1890), 2604; (1900), 6663.

Baker, Sir Samuel White (1821-1893), English traveller and author, was born in London, 8th June 1821. He was educated partly in England and partly in Germany. His father destined him for a commercial career, but a short experience of office-work proved him to be entirely unsuited to such a life. On 3rd August 1843 he married Henrietta Biddulph Martin, daughter of the rector of Maisemore, and the two following years were spent, with his wife, in Mauritius, looking

after some property held there by his father. The desire for travel took him in 1846 to Ceylon, where, in the following year, he founded an agricultural settlement at Newara Eliya, a mountain health-resort. Aided by his brother, he brought emigrants thither from England, together with choice breeds of cattle, and before long the new settlement was a success. His health necessitated his leaving Ceylon in 1855; and soon after his return to England his wife died (29th December 1855), leaving him with four children. During his residence in Ceylon he published *The Rifle and the Hound in Ceylon* (1853), and, two years later, *Eight Years' Wanderings in Ceylon* (1855). After a journey to Constantinople and the Crimea in 1856, he found an outlet for his restless energy by undertaking the supervision of the construction of a railway across the Dobruja, connecting the Danube with the Black Sea. After its completion he spent some months in a tour in south-eastern Europe and Asia Minor. It was during this time that he met, in Hungary, the lady who (in 1860) became his second wife, Florence, daughter of Herr Finnian von Sass. In 1861 he started upon his first tour of exploration in Central Africa. This, in his own words, was undertaken "to discover the sources of the Nile, with the hope of meeting the East African expedition under Captains Speke and Grant somewhere about the Victoria Lake." After a year's exploration of Abyssinia, as a result of which he fixed the position of the chief Nile tributaries in that region, he started from Khartum, in December 1862, to follow up the course of the White Nile. Two months later he met Speke and Grant, who were returning after their discovery of Victoria Nyanza. Their success made him fear that there was nothing left for his own expedition to accomplish; but the two explorers generously gave him information which enabled him, after separating from them, to achieve the discovery of Albert Nyanza, of whose existence credible assurance had already been given to Speke and Grant. Baker first sighted the lake on 14th March 1864, after which, having spent some time in the exploration of the neighbourhood, he started upon his return journey, and reached Khartum, after many checks, in May 1865. In the following October he returned to England, with his wife, who had accompanied him throughout the whole of the perilous and arduous journey. In recognition of his achievements the Royal Geographical Society awarded him its gold medal, and a similar distinction was bestowed on him by the Paris Geographical Society. In August 1866 he was knighted. In the same year he published *The Albert Nyanza, Great Basin of the Nile, and Explorations of the Nile Sources*, and, in 1867, *The Nile Tributaries of Abyssinia*, both books quickly going through several editions. In 1868 he published a story called *Cast up by the Sea*. In 1869, at the request of the Khedive, Baker undertook the command of a military expedition to Central Africa, with the object of suppressing the slave trade there and opening the way to commerce and civilization. Before starting from Cairo with a force of 1700 Egyptian troops he was given the rank of Pacha and Major-General in the Ottoman army. Lady Baker, as before, accompanied him. The Khedive appointed him Governor-General of the new territory for four years, at a salary of £10,000 a year; and it was not until the expiration of that time that Baker returned to Cairo, leaving his work to be carried on by the new governor, Colonel Gordon. He had at least succeeded in planting in the new territory the foundations upon which others could build up an administration; had he remained longer there, or had the Khedivial Government supported him with more vigour, the results of his efforts might have been more permanent. He returned to England with his wife in 1874, and in the

following year purchased the estate of Sandford Orleigh, in South Devon, where he made his home for the rest of his life. He published his narrative of the Central African expedition, under the title of *Ismailia*, in 1874. *Cyprus as I saw it in 1879*, was the result of a visit to that island. With the exception of winters spent in Egypt and India, Baker passed the rest of his life in comparative seclusion at Sandford Orleigh. He kept up an exhaustive and vigorous correspondence with men of all shades of opinion upon Egyptian affairs. Next to these, questions of maritime defence and strategy chiefly attracted him in his later years. He died at Sandford Orleigh on 30th December 1893. (R. F. S.)

Bakhtiári, one of the great nomad tribes of Persia, whose camping grounds are in the hilly district known as the Bakhtiári province. This province extends from Chahar Mahál (west of Isfahan) in the E., to near Shushtar in the W., and separated from Luristán in the N. by the Dizful river (Ab i Diz), and in the S. touches Behbahán and Ram Hormuz. The Bakhtiári are divided into the two great divisions Haft-lang and Chahar-lang, and a number of branches and clans, and were known until the 15th century as the "Great Lurs," the "Little Lurs" being the tribes settled in the district now known as Luristán, with Khorremábád as capital. According to popular tradition the Lurs originally came from Syria in the 10th century, but it is now held that they were in Persia long, perhaps fifteen centuries, before. They speak the Lur language, a Persian dialect. The Bakhtiári number about 38,000 or 40,000 families, under 200,000 souls, while the area of the district occupied by them is about 25,000 square miles. About fifty or sixty years ago they could put 20,000 well-equipped horsemen into the field, but in consequence of misrule and long-lasting feuds between the different branches, which the Government often fostered, or even instigated, the district has become poor, and it would now be difficult to find 4000 horsemen. The province is under the governor-general of Arabistan, and pays a yearly tribute of about £5000. The chiefs of the Bakhtiári, in 1897, having obtained the Shah's permission for improving the road between Shushtar, or Ahváz, and Isfahan, an iron suspension bridge with a span of 120 feet was erected over the Karun river at Gudár i Balútek; another, with a span of 70 feet, over the Bázuft river at Pul i Amárat; and a stone bridge over the Karun at Do-pu-lán. A great part of the traffic from the Persian Gulf to Isfahan will probably now be diverted from the Bushire-Shiraz-Isfahan road to the Ahvaz-Bakhtiári-Isfahan one.

For accounts of the Bakhtiári and their country the following works may be consulted with advantage:—Mrs BISHOP. *Journeys in Persia and Kurdistan*. London, 1893.—C. de BODE. *Travels in Luristan*. London, 1841.—Hon. G. N. CURZON. *Persia and the Persian Question*, vol. ii. 283-303. London, 1892.—Sir H. LAYARD. *Early Adventures in Persia*. London, 1894. (A. H. S.)

Bakony, a large chain of mountains in south-west Hungary, E. of the Alps, in the counties of Veszprém, Zala, and Fejér. It extends some 68 miles from south-west to north-east, and 18 to 31 miles from north-west to south-east. The highest peak is Köröshegy (2339 feet). On the shores of Lake Balaton the range has many beautiful basaltic cones, and its other peaks are also mostly coniform or dome-shaped, being richly covered with beech-woods. Formerly the Bakony was a wild forest, full of game, but its wild character has disappeared. Only the stag, deer, and badger are now found in any numbers. Glass-works, porcelain manufactories, forges, and sawmills have been built on its wooded slopes. The soil produces grapes yielding excellent wine, and

on the tops of the hills are many romantic ruins of old castles.

Baku, a Russian government of Transcaucasia, bounded by the Caspian Sea from 41° 50' to 38° 30' N. lat. in the E., and the Russian provinces of Daghestan and Elisabethpol and Persia in the W. and S. It covers part of the plains on the north-east slope of the Caucasus (Kuba plain); the south-east extremity of the main Caucasus range, from Shah-dagh and Bazardyuz to the Caspian, where it ends in the Apsheron peninsula; the low plains and steppes of the lower Kura; and finally a narrow belt of the slopes of the Anti-Caucasus plateaus, steeply falling about Lenkoráñ to the Caspian Sea, where the gulf of Kyzyl-agach, protected by a peninsula of the same name, is formed. The province is watered by the lower Kura and by a number of small rivers.

The northern part, on both slopes of the Caucasus, is very fertile and well irrigated, with fine forests and rich fields (partly rice) and gardens. Shemakha is renowned for silkworm culture. The plains on the Kura are also fertile, but require irrigation, especially for the cotton-tree plantations. The Mugáñ and Shirvan steppes are richly covered with grass from October to March. The fisheries at the mouth of the Kura (Bozhiy Promysel) are the richest in Russia. The Lenkoráñ district has a very warm climate (year, 53° Fahr.; January, 38°; July, 79°), and has a large rainfall (47.6 in.), i.e., five times as much as Baku. Rice-fields and rich gardens are characteristic of the district. The Apsheron peninsula is dry and nearly devoid of vegetation, but it contains very rich naphtha wells, the richest of which are 8 miles E.N.E. and 3 miles S.W. of Baku. The extraction of naphtha, which attained only 5500 tons in 1863, has grown rapidly, reaching 7,380,000 tons in 1898. The wells, opened by boring 500 to 680 feet deep, throw out enormous quantities of naphtha mixed with sea-water (up to 10,000 tons a day); 765,000 tons of refined paraffin oil were obtained in the same year, and 788,000 exported abroad. It is exported in cistern-ships and railway carriages. The vine tree is widely grown, as also the mulberry tree for silkworm rearing, especially in the district of Shemakha. Spirit is obtained in large quantities. Permanent population (1897), 789,659; 814,789 according to the Caucasus census of 1896. Of the 712,703 inhabitants inscribed in 1891, only 42,430 were Russians, 376,520 were Tatars, 118,165 Tates, 55,460 Armenians, 50,510 Talyshins, 41,784 Kyurins, and so on. It is divided into six districts, the chief towns of which are:—Baku, capital of the province (112,253 inhabitants in 1897); Geok-chai (2247 in 1896); Saliány, chief town of Jevat district (10,168); Kuba (15,346); Lenkoráñ (8768); Shemakha (20,008).

Baku, capital of the above province, on the S. coast of the Apsheron peninsula, 381 miles by rail E.S.E. of Tiflis, 40° 21' N. and 49° 50' E., is now connected by a railway with the seaport of Petrovsk, and consequently with the Russian railway system *via* Vladikavkaz. No other town of Russia has developed as rapidly as Baku, its population having grown from 13,381 in 1860 to 112,253 in 1897.

Baku has in its southern part a stone quay, 1½ mile long, the governor's house, the old garden of the khans, and many rich shops. Numbers of well-paved streets with good European buildings spread inwards, while the Asiatic town, with narrow winding streets, is built in terraces on the slope of a hill. Here are the ruins of a once beautiful palace of the khans built in the 15th century, the mosque of the shahs built in 1078, and, by the sea, the "tower of the girls," now transformed into a lighthouse. The "black town," with its naphtha wells and works, lies to the north. The climate of Baku is extreme, the average temperature being: year, 58° Fahr.; January, 38°; July, 80°; yearly rainfall, 9.4 inches. A north-north-west wind of exceptional force blows occasionally in winter. Owing to its good harbour and fortunate position, Baku is also the chief depot for all sorts of goods coming from Persia and Transcaucasia—raw cotton, rice, silk, wine, fish, dried fruit, and timber—as also for Russian manufactured goods. The port is visited yearly by 3550 steamers and about 2200 sailing vessels.

Balaghat (=above the *ghats* or passes, the high-lands), a district of British India in the Nagpur division of the Central Provinces. The administrative headquarters are at the town of Burha. The district contains an area of 3139 square miles. The population in 1891 was

383,331, being 122 persons per square mile; Hindus numbering 282,169, Mahomedans 6901, aborigines 93,917 (chiefly Gonds), Christians 35, of whom 14 were Europeans. In 1901 the population was 326,704, showing a decrease of 15 per cent., due to the effects of famine. The total amount of land revenue and rates was returned as Rs.1,18,835, the incidence of assessment being Rs.0:3:6 per acre of assessed area; the number of police was 237. In 1897-98, out of a total cultivated area of 332,761 acres, 51,827 were irrigated from tanks, &c. A large part of the area (554,313 acres) is still covered with forest, the most valuable timber-tree being *sal*. There are no railways, and few good roads. In 1897-98 there were 66 schools, attended by 3791 pupils. The district suffered very severely from the famine of 1896-97. In 1897 the death-rate was returned at 84 per 1000, rising to 307 in the town of Burha. It suffered again in 1900, when in April the number of persons relieved rose above 100,000.

Balakovo, a village of south-eastern Russia, government of Samara, 10 miles above the mouth of the Irghiz. It is one of the chief river ports on the Volga. Nearly 167,000 tons of grain are exported every year, while manufactured goods are imported for a wide and wealthy prairie region. It also contains iron works. The population is 15,995.

Balance of Trade.—This term belongs originally to the period of Political Economics when the "mercantile theory" prevailed, but it is still in use, though not quite perhaps in the same way as at its origin. The "balance of trade" was then identified with the sum of the precious metals which a country received in the course of its trading with other countries or with particular countries. There was no doubt an idea that somehow or other the amount of the precious metals received represented profit on the trading, and each country desired as much profit as possible. Princes and sovereigns, however, with political aims in view, were not close students of mercantile profits, and would probably have urged the acquisition of the precious metals as an object of trade even if they had realized that the country as a whole was exporting "money's worth" in order to buy the precious metals which were desired for political objects. The "mercantile theory" was exploded by Adam Smith's demonstration that gold and silver were only commodities like others with no special virtue in them, and that they would come into a country when there was a demand for them, according to the amount, in proportion to other demands, which the country could afford to pay; but the ideas in which the theory itself have originated have not died out, and the idea especially of a "balance of trade" to which the rulers of a country should give attention is to be found in popular discussions of business topics and in politics, the general notion being that a nation is prosperous when its statistics show a "trade balance" in its favour and unprosperous when the reverse is shown. In recent times the excess of imports over exports or of exports over imports, shown in the statistics of foreign trade, has also come to be identified in popular speech with the "balance of trade," and many minds are no doubt imbued with the ideas (1) that an excess of imports over exports is bad, and (2) an excess of exports over imports is the reverse, because the former indicates an "unfavourable" and the latter a "favourable" trade balance. In the former case it is urged that a nation so circumstanced is living on its capital. Exact remedies are not suggested, although the idea of preventing or hampering foreign imports as a means of developing home trade and of thus altering the supposed disastrous trade balance is obviously the logical inference

from the arguments. A consideration of these ideas, and of recent discussions about imports and exports, appears accordingly to be needed, although the mercantile theory is itself exploded.

The phrase "balance of trade," then, appears to be an application of a trader's language in his own business to the larger affairs of nations or rather of the aggregate of individuals in a nation engaged in foreign trade. A trader in his own books sets his sales against his purchases, and the amount by which the former exceed the latter is his trade balance or profit. What is true of the individual, it is assumed, must be true of a nation or of the aggregate of individual traders in a nation engaged in the foreign trade. If their collective sales amount to more than their collective purchases the trade balance will be in their favour, and they will have money to receive. Contrariwise, if their purchases amount to more than their sales, they will have to pay money, and they will presumably be living on their capital. The argument fails, however, in many ways. Even as regards the experience of the individual trader, it is to be observed that he may or may not receive his profit, if any, in money. As a rule he does not do so. As the profit accrues he may invest it either by employing labour to add to his machinery or warehouses, or by increasing his stock-in-trade, or by adding to his book debts, or by a purchase of stocks or shares outside his regular business. At the end of a given period he may or may not have an increased cash balance to show as the result of his profitable trading. Even if he has an increased cash balance, according to the modern system of business, this might be a balance at his bankers', and they in turn may have invested the amount so that there is no stock of the precious metals, of "hard money," anywhere to represent it. And the argument fails still further when applied to the transactions between nations, or rather, to use the phrase already employed, between the aggregate of individuals in nations engaged in the foreign trade. It is quite clear that if a nation, or the individuals of a nation, do make profit in their foreign trading, the amount may be invested as it accrues—in machinery, or warehouses, or stock-in-trade, or book debts, or stocks and shares purchased abroad, so that there may be no corresponding "balance of trade" to bring home. There is no doubt also that what may be is in reality what largely happens. A prosperous foreign trade carried on by any country implies a continuous investment by that country either abroad or at home, and there may or may not be a balance receivable in actual gold and silver.

In another particular the argument also fails. In the aggregate of individual trading with foreign countries, there may sometimes be purchases and sales as far as the individuals are concerned, but not purchases and sales as between the nations. We see this in the dealings with foreign governments. Goods are exported from the United Kingdom, ammunition and stores and ships, which appear in the British returns as exports, and which have really been sold by individual British traders to individuals abroad; but these sales are not set off by any purchases on the other side which come into the international account, as the set-off is a loan by the people of one country to the people or government of another. The same with the export of railway and other material when goods are exported for the purpose of constructing railways or other works abroad. The sales are made by individuals here to individuals abroad; but there is no set-off of purchases on the other side. *Mutatis mutandis* the same explanation applies to the remittance of goods by one country to another, or by individuals in one country to individuals in another to pay the interest or repay the capital of loans which have been received in

former times. These are all cases of the movement of goods irrespective of international sales and purchases, though the movements themselves appear in the international records of imports and exports, and therefore it seems to be assumed, though without any warrant, in the international records of the balance of trade. There is yet another failure in the comparison. The individual trader would include in his sales and purchases services such as repairs performed by him for others, and similar services which others do for himself; but no similar accounts are kept of the corresponding portions of international trade such as the earning of freights and commissions, although in strictness, it is obvious, they belong as much to international trade as the imports and exports themselves, which cannot therefore show a complete "balance of trade."

The illusions which may result then from the confusion of ideas between a balance of trade or profit, and a balance of cash paid or received, and from the identification of an excess of imports over exports or of exports over imports with the balance of trade itself, though they are not the same things, hardly need description. The believers in such illusions are not entitled to any hearing as economists, however much they may be accepted in the market-place or among politicians.

The "balance of trade" and "the excess of imports over exports" are thus simply pitfalls for the amateur and the unwary. On the statistical side, moreover, there is a good deal more to be urged in order to impress the student with care and attention. The records of imports and exports themselves may vary from the actual facts of international purchases and sales. The actual values of the goods imported and paid for by the nation may vary from the published returns of imports which are, by the necessity of the case, only estimated values. And so with the exports. The actual purchases and sales may be something very different. A so-called sale may prove abortive through its not being paid for at all, the debtor failing altogether. In any case the purchases of a year may not be paid for by the sales of the year, and the "squaring" of the account may take a long time. Still more the estimates of value may be so taken as not to give even an approximately correct account as far as the records go. Thus in the plan followed in the United Kingdom imports are valued as at the port where they arrive and exports at the port where they are despatched from—a plan which so far places them on an equal footing for the purpose of striking a balance of trade. But in the import and export records of the United States a different plan is followed. The imports are no longer valued as at the port of arrival with the freight and other charges included, but as at the port of shipment. The results on the balance of trade drawn out must accordingly be quite different in the two cases. With other countries similar differences arise. To deduce then from records of imports and exports any conclusions as to the excess of imports or exports at different times is a work of enormous statistical difficulty, quite apart from the farther difficulties of substance above described which beset the problem.

It remains only to notice that the country which presents the most interesting questions in connexion with the study is the United Kingdom, which has by far the largest foreign trade. Its annual imports and exports, excluding bullion, exceed 800 millions sterling, and the bullion one year with another is 100 millions more. Its excess of imports moreover in the last forty years has gradually risen from a small figure to 180 millions sterling annually, and has given rise mainly to the popular discussion referred to respecting an "adverse" balance of trade, and particularly to the belief existing in many quarters that the nation is living on its capital. The result has been a new investigation of the subject, so as to bring out and present the credits to which

the country is entitled in its trade as a shipowner and commission merchant, and to exhibit at the same time the magnitude of British foreign investments, which cannot be less than 2000 millions sterling and must bring in an enormous annual income. Other countries, however, such as France, Germany, Belgium, Holland, Denmark, Norway, and Sweden, are in the same condition, though their foreign trade is not on the same scale, and similar rules apply to the reading of their import and export accounts. The United States, on the other hand, is a conspicuous instance of a country which as yet is in the position of a borrower and has a large excess of exports over imports, though there are signs of a change in the opposite direction. New countries generally, such as Canada, Australia, and the South American countries, resemble the United States. Comparisons are made difficult by the want of uniformity in the methods of stating the figures, but that different countries have to be grouped according as they are indebted or creditor countries is undeniable, and no study of the trade statistics is possible without recognition of the underlying economic circumstances.

In conclusion it may be useful to repeat the main propositions laid down as to the balance of trade. (1) A "balance of trade" to the individual trader, from whose experience the phrase comes, is not necessarily, as is supposed, a balance received or receivable in the precious metals. It may be invested as it accrues—in machinery, or warehouses, or stock-in-trade, or in book debts, or in stocks and shares or other property outside the trader's business, as well as in cash. (2) What is true of the individual trader is also true of the aggregate of individuals engaged in the foreign trade of a country. Cash is only one of the forms in which they may elect to be paid. (3) The imports and exports recorded in the statistical returns of a country do not correspond with the purchases and sales of individual traders, as the sales especially may be set off by loans, while the so-called imports may include remittances of interest and of capital repaid. (4) When capital is repaid the country receiving it need not be living on it, but may be investing it at home. (5) The foreign trading of countries may also comprise many transactions, such as the earning of freights and commissions, which ought to appear in a proper account showing a balance of trade, as similar transactions appear in an individual trader's account, but which are not treated as imports or exports in the statistical returns of a nation's foreign trade. (6) Import and export returns themselves are not the same as accounts of purchases and sales; the values are only estimates, and must not be relied on literally without study of the actual facts. (7) Import and export returns in different countries are not in all cases taken at the same point, there being important variations, for instance, in this respect between the returns of two great countries, the United Kingdom and the United States, which are often compared, but are really most difficult to compare. (8) The United Kingdom is a conspicuous instance of a country which has a great excess of imports over exports in consequence of its large lending abroad in former times; while its accounts are specially affected by the magnitude of its services as a trading nation carrying passengers and goods all over the world, which do not result, however, in so-called "exports." The United States, on the other hand, is a conspicuous instance of an indebted nation, which has or had until lately few or no sums to its credit in foreign trade except the visible exports. (9) The various countries of the world naturally fall into groups. The nations of Western Europe, such as France, Germany, Belgium, Holland, with Sweden and Norway, fall into a group with Great Britain as creditor nations, while Canada, Australasia, and the South American countries fall into a group with the United States as

undeveloped and indebted countries. So also of other countries. Each belongs naturally to one group or another. (10) The excess of imports or exports may vary indefinitely at different times according as a creditor country is receiving or lending at the time, or according as a debtor country is borrowing or paying off its debts at the time, but the permanent characteristics are always to be considered.

(R. GN.)

Balanoglossus is the general name given to certain peculiar opaque worm-like animals which live an obscure life under stones, and burrow in the sand from between tide-marks down to the abyssal regions of the sea. Their colour is usually some tone of yellow with dashes of red, brown, and green, and they frequently emit a pungent odour. The name has reference to the tongue-shaped muscular proboscis by which the animal works its way through the sand. The proboscis is not the only

organ of locomotion, being assisted by the succeeding segment of the body, the buccal segment or collar. By the waves of contraction executed by the proboscis accompanied by inflation of the collar, progression is effected, sometimes with marvellous rapidity. The third body-region or trunk may attain a great length, one or two feet, or even more, and is also muscular, but the truncal muscles are of subordinate importance in locomotion, serving principally to promote the peristaltic contractions of the body by which the food is carried through the gut. The function of alimentation is closely associated with that of locomotion, somewhat as in the burrowing earthworm; in the excavation of its burrows the sand is passed through the body, and any nutrient matter that may adhere to it is extracted during

FIG. 1.—*Ptychodera flava* (New Caledonia), from above; about life size.

its passage through the intestine, the exhausted sand being finally ejected through the vent at the orifice of the burrow and appearing at low tide as a worm casting. In accordance with this manner of feeding, the mouth is kept permanently open and prevented from collapsing by a pair of skeletal cornua belonging to a sustentacular apparatus (the **nuchal skeleton**), the body of which lies within the narrow neck of the proboscis; the latter is inserted into the collar and surrounded by the anterior free flap of this segment of the body.

When first discovered by Eschscholtz at the Marshall Islands in 1825, *Balanoglossus* was described as a worm-like animal belonging to the Echinoderm order of Holothurians or sea-cucumbers. In 1865 Kowalevsky discovered that the organs of respiration consist of numerous pairs of gill-slits leading from the digestive canal through the thickness of the body-wall to the exterior. On this account the animal was subsequently placed by Gegenbaur in a special class of Vermes, the **Enteropneusta**. In 1883-86 Bateson showed by his embryological researches that the Enteropneusta exhibit chordate (vertebrate) affinities in respect of the coelomic, skeletal, and nervous systems as well as in regard to the

respiratory system, and, further, that the gill-slits were formed upon a plan similar to that of the gill-slits of *Amphioxus*, being subdivided by tongue-bars which depend from the dorsal borders of the slits.

Cœlom and Pore-canals.—In correspondence with the tri-regional differentiation of the body in its external configuration, the cœlom (body-cavity, perivisceral cavity) is divided into three portions completely separated from one another by septa:—(1) proboscis-cœlom, or first body-cavity; (2) the collar-cœlom, or second body-cavity; (3) truncal cœlom, or third body-cavity. Of these divisions of the cœlom the first two communicate with the exterior by means of a pair of ciliated **pore-canals** placed at the posterior end of their respective segments. The proboscis-pores are highly variable, and frequently only one is present, that on the left side; sometimes the pore-canals of the proboscis unite to open by a common median orifice, and sometimes their communication with the proboscis-cœlom appears to be occluded, and finally the pore-canals may be quite vestigial. The collar-pores are remarkable for their constancy; this is probably owing to the fact that they have become adapted to a special function, the inhalation of water to render the collar turgid during progression. There are reasons for supposing that the truncal cœlom was at one time provided with pore-canals, but supposed vestiges of these structures have only been described for one genus, *Spengelidia*, in which they lie near the anterior end of the truncal cœlom.

Enteron.—Not only is the cœlom thus subdivided, but the enteron (gut, alimentary canal, digestive tube) itself shows indications of three main subsections in continuity with one another:—(1) proboscis-gut ("Eicheldarm," stomochord, *vide infra*); (2) collar-gut (buccal cavity, throat); (3) truncal gut extending from the collar to the vent.

Stomochord.—The proboscis-gut occurs as an outgrowth from the anterior dorsal wall of the collar-gut, and extends forwards into the basal (posterior) region of the proboscis, through the neck into the proboscis-cœlom, ending blindly in front. Although an integral portion of the gut, it has ceased to assist in alimentation, its epithelium undergoes vacuolar differentiation and hypertrophy, and its lumen becomes more or less vestigial. It has, in fact, become metamorphosed into a resistant supporting structure resembling in some respects the notochord of the true Chordata, but probably not directly comparable with the latter structure, being related to it solely by way of substitution. On account of the presence and mode of origin (from the gut-wall) of this organ Bateson introduced the term **Hemichorda** as a phyletic name for the class Enteropneusta. As the proboscis-gut appears to have undoubtedly skeletal properties, and as it also has topographical relations with the mouth, it has been designated in English by the non-committal term **stomochord**. It is not a simple diverticulum of the collar-gut, but a complex structure possessing paired lateral pouches and a ventral convexity (ventral cœcum), which rests in a concavity at the front end of the body of the nuchal skeleton (Fig. 3). In some species (*Spengelidia*) there is a long capillary vermiform extension of the stomochord in front. The **nuchal skeleton** is a non-cellular laminated thickening of basement-membrane underlying that portion of the stomochord which lies between the above-mentioned pouches and the orifice into the throat. At the point where the stomochord opens into the buccal cavity the nuchal skeleton bifurcates, and the two cornua thus produced pass obliquely backwards and downwards embedded in the wall of the throat, often giving rise to projecting ridges that bound a dorsal groove of the collar-gut which is in continuity with the wall of the stomochord (Fig. 3).

Nervous System.—At the base of the epidermis (which is in general ciliated) there is over the entire surface of the body a layer of nerve-fibres, occurring immediately outside the basement-membrane which separates the epidermis from the subjacent musculature. The nervous system is thus essentially epidermal in position and diffuse in distribution; but an interesting concentration of nerve-cells and fibres has taken place in the collar-region, where a medullary tube, closed in from the outside, opens in front and behind by anterior and posterior neuropores. This is the collar nerve-tube. Sometimes the central canal is wide and uninterrupted between the two neuropores; in other cases it becomes broken up into a large number of small closed medullary cavities, and in others again it is obsolete. In one family, the *Ptychoderidae*, the medullary tube of the collar is connected at intermediate points with the epidermis by means of a variable number of unpaired outgrowths from its dorsal wall; generally containing an axial lumen derived from and in continuity with the central canal. These hollow roots terminate blindly in the dorsal epidermis of the collar, and place the nervous layer of the latter in direct connexion with the fibres of the nerve-tube. The exact significance of these roots is a matter for speculation, but it seems possible that they are epiphysal

structures remotely comparable with the epiphysial (pineal) complex of the craniate vertebrates. In accordance with this view there would be also some probability in favour of regarding the collar nerve-tube of the Enteropneusta as the equivalent of the cerebral vesicle only of Amphioxus and the Ascidian tadpole, and also of the primary fore-brain of vertebrates.

Special thickenings of the diffuse nervous layer of the epidermis occur in certain regions and along certain lines. In the neck of the proboscis the fibrous layer is greatly thickened, and other intensifications of this layer occur in the dorsal and ventral middle lines of the trunk extending to the posterior end of the body. The dorsal epidermal nerve-tract is continued in front into the ventral wall of the collar nerve-tube, and at the point of junction there is a circular commissural thickening following the posterior rim of the collar and affording a special connexion between the dorsal and ventral nerve-tracts. From the ventral surface of the collar nerve-tube numerous motor fibres may be seen passing to the subjacent musculature. These fibres are not aggregated into roots.

Gill-slits.—The possession of gill-slits is as interesting a feature in the organization of Balanoglossus as is the presence of tracheæ in Peripatus. These gill-slits occupy a variable extent of the anterior portion of the trunk, commencing immediately behind the collar-trunk septum. The branchial bars which constitute the borders of the clefts are of two kinds:—(1) **Septal bars** between two contiguous clefts, corresponding to the primary bars in Amphioxus; (2) **Tongue-bars.** The chief resemblances between

FIG. 2.—Structure of branchial region. *bc*, branchial cleft; *gp*, gill-pore; *tb*, tongue-bar; *ds*, dorsal nerve; *dv*, dorsal vessel; *pr*, pharynx; *w*, body wall; *vs*, ventral septum; *vn*, ventral nerve.

the septal bars in bulk, while in Amphioxus the reverse is the case; (b) the tongue-bar contains a large coelomic space in Balanoglossus, but is solid in Amphioxus; (c) the skeletal rods in the tongue-bars of Balanoglossus are double; (d) the tongue-bar in Balanoglossus does not fuse with the ventral border of the cleft, but ends freely below, thus producing a continuous U-shaped cleft. The meaning of this singular contrast between the two animals may be that we have here an instance of an interesting gradation in evolution. From serving primitively as the essential organ of the cleft the tongue-bar may have undergone reduction and modification, becoming a secondary bar in Amphioxus, subordinate to the primary bars in size, vascularity, and development; finally, in the craniate vertebrates it would then have completed its involution, the suggestion having been made that the tongue-bars are represented by the thymus-primordia.

Gill-pouches and Gill-pores.—Only rarely do the gill-slits open freely and directly to the exterior (Fig. 1). In most species of Balanoglossus each gill-slit may be said to open into its own atrial chamber or **gill-pouch**; this in its turn opens to the exterior by a minute **gill-pore**. There are, therefore, as many gill-pouches as there are gill-slits, and as many gill-pores as pouches. The gill-pores occur on each side of the dorsal aspect of the worm in a longitudinal series at the base of a shallow groove, the **branchial groove**. The respiratory current of water is therefore conducted to the exterior by different means from that adopted by Amphioxus, and this difference is so great that the theory which seeks to explain it has to postulate radical changes of structure, function, and topography.

Excretory and Vascular Systems.—It seems likely that the coelomic pore-canal was originally excretory organs, but in the existing Enteropneusta the pore-canal (especially the collar canal) have, as we have seen, acquired new functions or become vestigial, and the function of excretion is now mainly accomplished by a structure peculiar to the Enteropneusta called the

glomerulus, a vascular complex placed on either side of the anterior portion of the stomochord, projecting into the proboscis-coelom. The vascular system itself is quite peculiar, consisting of lacunæ and channels destitute of endothelium, situated within the thickness of the basement-membrane of the body-wall, of the gut-wall, and of the mesenteries. The blood, which is a non-corpuscular fluid, is propelled forwards by the contractile dorsal vessel and collected into the **central blood-sinus**; this lies over the stomochord, and is surrounded on three sides by a closed vesicle, with contractile walls, called the **pericardium** ("Herzblase"). By the pulsation of the pericardial vesicle (best observed in the larva) the blood is driven into the glomerulus, from whence it issues by efferent vessels which effect a junction with the ventral (sub-intestinal) vessel in the trunk. The vascular system does not readily lend itself to morphological comparison between such widely different animals as Balanoglossus and Amphioxus, and the reader is therefore referred to the memoirs cited at the end of this article for further details.

Reproductive System.—The sexes are separate, and when mature are sometimes distinguished by small differences of colour in the genital region. Both male and female gonads consist of more or less lobulated hollow sacs connected with the epidermis by short ducts. In their disposition they are either uniserial, biserial, or multiserial. They occur in the branchial region, and also extend to a variable distance behind it. In exceptional cases they are either confined to the branchial region or excluded from it. When they are arranged in uniserial or biserial rows the genital ducts open into or near the branchial grooves in the region of the pharynx, and in a corresponding position in the post-branchial region. An important feature is the occurrence in some species (Ptychoderidae) of paired longitudinal pleural or lateral folds of the body which are mobile, and can be approximated at their free edges so as to close in the dorsal surface, embracing both the median dorsal nerve-tract and the branchial grooves with the gill-pores, so as to form a temporary peribranchial and medullary tube, open behind where the folds cease. On the other hand, they can be spread out horizontally so as to expose their own upper side as well as the dorsal surface of the body (Fig. 1). These folds are called the **genital pleuræ** because they contain the bulk of the gonads. Correlated with the presence of the genital pleuræ there is a pair of vascular folds of the basement membrane proceeding from the dorsal wall of the gut in the post-branchial portion of the branchio-genital region, and from the dorsal angles made by the pleural folds with the body-wall in the pharyngeal region; they pass, in their most fully developed condition, to the free border of the genital pleuræ. These vascular membranes are called the **lateral septa**. Since there are many species which do not possess these genital pleuræ, the question arises as to whether their presence or their absence is the more primitive condition. Without attempting to answer this question categorically, it may be pointed out that within the limits of the family (Ptychoderidae) which is especially characterized by their presence there are some species in which the genital pleuræ are quite obsolete, and yet lateral septa occur (e.g. *Ptychodera ruficollis*), seeming to indicate that the pleural folds have in such cases been secondarily suppressed.

Development.—The development of Balanoglossus takes place according to two different schemes, known as **direct** and **indirect**, correlated with the occurrence in the group of two kinds of ova, large and small. Direct development, in which the adult form is achieved without striking metamorphosis by a gradual succession of stages, seems to be confined to the family Balanoglossidae. The remaining two families of Enteropneusta, Ptychoderidae and Spengelidae, contain species of which probably all pursue an indirect course of development, culminating in a metamorphosis by which the adult form is attained. In these cases the larva, called *Tornaria*, is pelagic and transparent, and possesses a complicated ciliated seam, the longitudinal ciliated band, often drawn out into convoluted bays and lappets. In addition to this ciliated band the form of the *Tornaria* is quite characteristic and unlike the adult. The *Tornaria* larva offers a certain similarity to larvae of Echinoderms (sea-urchins, star-fishes, and sea-cucumbers), and when first discovered was so described. It is within the bounds of possibility that *Tornaria* actually does indicate a remote affinity on the part of the Enteropneusta to the Echinoderms, not only on account of its external form, but also by reason of the possession of a dorsal **water-pore** communicating with the anterior body-cavity. In the direct development Bateson showed that the three divisions of the coelom arise as pouches constricted off from the archenteron or primitive gut, thus resembling the development of the mesoblastic somites of Amphioxus. It would appear that while the direct development throws light upon the special plan of organization of the Enteropneusta, the indirect development affords a clue to their possible derivation. However this may be, it is sufficiently remarkable that a small and circumscribed group like the Enteropneusta, which presents such a comparatively uniform plan of composition and of

external form, should follow two such diverse methods of development.

Distribution.—Some thirty species of *Balanoglossus* are known, distributed among all the principal marine provinces from Greenland to New Zealand. The species which occurs in the English Channel is *Ptychodera sarniensis*. The Ptychoderidae and Spengelidae are predominantly tropical and subtropical, while the *Balanoglossidae* are predominantly arctic and temperate in their distribution. One of the most singular facts concerning the geographical distribution of Enteropneusta has recently been brought

Results (Willey), part iii. 1899; see also *Q. J. M. S.* vol. xlii. p. 223, 1899.—HILL, J. P. "The Enteropneusta of Funafuti," *Mem. Austral. Mus.*, iii. 1897-98.—CAULLERY, M., et MESNIL, F. "Balanoglossus Kochleri, n. sp. English Channel," *C. R. Soc. Biol.* lii. p. 256, 1900. (A. W.*)

Balasore, a town and district of British India, in the Orissa province of Bengal, on the right bank of the river Burabalong, about seven miles from the sea. The town still possesses a large maritime trade, despite the silting-up of the river mouth. It is a station on the East Coast railway. It has a high school, two printing-presses, which each issue a vernacular newspaper, and three literary institutions. Population, about 21,000.

The district of **BALASORE**, which stretches along the coast between the sea and the hills of Orissa, has an area of 2473 square miles. The population in 1891 was 994,536, giving an average density of 402 persons per square mile; Hindus numbering 969,211, Mahomedans 24,250, Christians 1075, of whom 96 were Europeans. In 1901 the population was 1,081,426, showing an increase of 9 per cent. Land revenue and rates (1897-98) were Rs.4,88,011; the number of police was 396; boys at school (1896-97), 31,277. Almost the only crop grown is rice, which is largely exported by sea. The registered death-rate (1897) was 30.5 per 1000. The former industry of manufacturing salt from sea-brine by boiling in pots is now extinct. The country is exposed to destructive floods from the hill-rivers, and also from cyclonic storm-waves. The district is traversed throughout its entire length by the navigable Orissa coast canal, and also by the East Coast railway, from Calcutta to Madras. The seaports of Balasore, Chandbali, and Dhamra conduct a very large coasting trade, valued in 1897-98 at Rs.1,38,05,460, or nearly a million sterling. The number of vessels that cleared was 420, with a tonnage of 107,919. The exports are almost confined to rice, which is sent to Ceylon, the Maldives, and Mauritius. The imports consist of cotton twist and piece goods, mineral oils, metals, betel-nuts, and salt.

Balaton (PLATTENSEE), the largest lake of Middle Europe, in the south-west of Hungary, situated between the counties of Veszprém, Zala, and Somogy. Its length is 48 miles, average breadth $3\frac{1}{2}$ miles, greatest breadth $7\frac{1}{2}$ miles, least breadth a little less than 1 mile. It covers 266 square miles, and has a greatest depth of 149 feet. Its northern shores are bordered by the beautiful basaltic cones of the Bakony Mountains, the volcanic soil of which produces grapes yielding excellent wine; the southern consist partly of a marshy plain, partly of downs. The most beautiful point of the lake is that where the peninsula of Tihany projects in the waters. An ancient church of the Benedictines is here situated on the top of a hill. In a tomb therein is buried Andrew I. (d. 1061), a king of the Hungarian Arpadian dynasty. The temperature of the water varies greatly, in a manner resembling that of the sea, and many connect its origin with a sea of the Miocene period, the waters of which are said to have covered the Hungarian plain. About fifty streams flow into the lake, which drains into the Danube and is well stocked with fish. It often freezes in winter. Lake Balaton is of growing importance as a bathing resort.

Balayan, a town of 24,700 inhabitants, at the head of the Gulf of Balayan, in the province of Batangas, Luzon, Philippine Islands. It has an extremely healthful climate, and is in the midst of a very fertile district, which produces rice, cacao, coffee, pepper, and cotton. Horses and cattle are raised for market in considerable number. The fisheries are important. The language is Tagalog.

Balearic Islands, a group of islands in the Mediterranean, off the east coast of Spain, of which they

to light by Benham, who found a species of *Balanoglossus* s. str. on the coast of New Zealand hardly distinguishable from one occurring off Japan. Finally, *Glandiceps abyssicola* (Spengelidae) was dredged during the Challenger expedition in the Atlantic Ocean off the coast of Africa at a depth of 2500 fathoms.

form a province 1860 square miles in area, divided into five administrative districts and sixty-one parishes. The population was 289,035 in 1877, and 312,646 in 1887, when Mallorca contained 248,993 inhabitants, Menorca 38,959, Ibica 22,509, Formentera 1984, and the smaller islands the remaining 201. In 1897 the total population had decreased to 309,807. This decrease has not been due exclusively to emigration, as barely 650 inhabitants in all depart annually for Algeria or the Spanish mainland. In 1897 the live stock numbered only 176,113 head, this figure including 1737 horses, 17,289 mules, 8928 asses, 7275 cattle, 94,290 sheep, 10,432 goats, and 36,162 pigs. Only 15,000 acres are irrigated, but wheat is grown on 139,535 acres; oats, rye, barley on 101,187 acres; pod fruit on 35,877 acres; vines on 35,460 acres, and the olive on 67,100 acres. The export of oranges has greatly declined, their culture having been abandoned owing to an insect plague. Figs also are now only used to feed live stock and for consumption in the province. Besides the salt mines of Ibica, eight lignite, and ten lead mines are actually worked in the islands, and there are seventy-four unproductive mines, mostly lignite. The output of lignite amounted to 18,000 tons in 1898. The means of communication are being improved by the local corporations. Forty-eight miles of railways have been completed in Mallorca, the main line (40 miles) running from Palma to Manacor. The standard of primary education is well up to the average for Spain, and there are higher schools in the principal towns. The local industries are thriving. Shoemaking is one of the most prosperous trades in the islands. There is not a very active trade direct with foreign countries, as the principal imports—cotton, leather, petroleum, sugar, coal, and timber—are introduced into the islands through Barcelona. The export trade is chiefly with the peninsula, France, Italy, Algeria, and the Spanish West Indies. Most of the agricultural products are sent to the peninsula; wine, figs, marble, almonds, lemons, and rice, to Europe and Africa. In 1898 the imports of the Balearic isles were valued at £143,687 and the exports at £442,942.

The best modern work on the Balearics is that of the Archduke Ludwig Salvator, published in several volumes at Leipzig 1869-90, of which an abridged edition in Spanish was published at Palma in 1886.

(A. E. H.)

Balfour, Arthur James (1848—), British statesman, eldest son of the late James Maitland Balfour of Whittinghame, Haddingtonshire, and of Lady Blanche Gascoyne Cecil, second daughter of the second Marquis of Salisbury, was born 25th July 1848. He was educated at Eton and Trinity College, Cambridge. In 1874 he was elected in the Conservative interest for Hertford, and represented that constituency until 1885. When, in the spring of 1878, Lord Salisbury became Foreign Minister on the resignation of the 15th Lord Derby, Mr Balfour became his private secretary. In that capacity he accompanied Lord Salisbury to the Berlin Congress, and gained his first experience of international politics in connexion with the settlement of the Russo-Turkish conflict. It was at this time also that he became known in the world of letters, the intellectual subtlety and literary capacity of his *Defence of Philosophic Doubt* (1879) suggesting that he could, if he chose, make a reputation as a speculative thinker. Belonging, however, to a class to which the responsibilities of government are a traditional duty, Mr Balfour divided his time between the political arena and the study. Being released from his duties as private secretary by the general election of 1880, he began to take a rather more active part in parliamentary affairs. He was for a time politically associated with Lord Randolph Churchill, Sir Henry

Drummond Wolff, and Sir John (then Mr) Gorst, the quartette becoming known as the "Fourth Party," and gaining notoriety by the freedom of the criticisms directed by its leader, Lord Randolph Churchill, against Sir Stafford Northcote, Lord Cross, and other prominent members of the "old gang." In these sallies, however, Mr Balfour had no direct share. He was thought to be merely amusing himself with politics. It was regarded as doubtful whether his health could withstand the severity of English winters, and the delicacy of his physique and the languor of his manner helped to create the impression that, however great his intellectual powers might be, he had neither the bodily strength nor the energy of character requisite for a political career.

ARTHUR JAMES BALFOUR.

(From a photograph by Elliott and Fry, London.)

He was the "odd man" of the Fourth Party, apparently content to fetch and carry for his colleagues, and was believed to have no definite ambitions of his own. His reputation in the Parliament of 1880-86 was that of a dilettante, who allied himself with the three politicians already named from a feeling of irresponsibility rather than of earnest purpose; he was regarded as "one who, on the rare occasions when he spoke, was more desirous to impart an academic quality to his speeches than to make any solid contribution to public questions. The House, indeed, did not take him quite seriously. Members did not suspect the reserve of strength and ability beneath what seemed to them to be the pose of a parliamentary *flaneur*, looking upon him merely as a young member of the governing classes who remained in the House because it was the proper thing for a man of family to do. As a member of the clique known as the "Souls" he was, so to speak, caviare to the general. Indolence was supposed to be the keynote of his character—a refined indolence not, however, without cleverness of a somewhat cynical and superior order.

That these views were not shared by Lord Salisbury is sufficiently shown by the fact that in his first Administration (June 1885-January 1886) he made Mr Balfour President of the Local Government Board, and in forming his second administration (July 1886) secretary for Scotland with a seat in the Cabinet. These offices gave few opportunities for distinction, and may be regarded merely as Mr Balfour's apprenticeship to Departmental responsibilities. The accidents of political life suddenly opened out to him a career which made him, next to Lord Salisbury, the most prominent, the most admired, and the most attacked Conservative politician of the day. Sir Michael Hicks-Beach, who was chief secretary for Ireland, suffered from an affection of the eyes, and found it desirable to resign, and Lord Salisbury appointed his nephew in his stead. The selection took the political world by surprise, and was much criticized. By the Irish Nationalists it was received with contemptuous ridicule, for none suspected Mr Balfour's immense strength of will, his debating power, his ability in attack, and his still greater capacity to disregard

criticism. The debates on the Crimes Bill and the Irish Land Bill quickly undeceived them, and the steady and even remorseless vigour with which the government of Ireland was conducted speedily convinced the House of Commons and the country that Mr Balfour was in his right place as Chief Secretary. His policy was that of "coercion"—the fearless administration of the Crimes Act,—coupled with remedial legislation; and he enforced the one while he proceeded with the other, regardless of the risk of outrage outside the House and of insult within. Mr Balfour's work at this period covered one of the most turbulent and most exciting periods in modern Parliamentary history and Irish administration. With a courage that never faltered he broke down the Plan of Campaign in Ireland, and in Parliament he not only withstood the assaults of the Irish Nationalists, but waged successful warfare with the entire Home Rule party. He combined an iron will with a mastery of facts unsurpassed by any of his predecessors in the Secretaryship. Events, it is true, were in his favour. The disclosures before the Parnell Commission, the O'Shea divorce proceedings, the downfall of Mr Parnell, and the disruption of the Irish party, assisted him in his task; but the fact remains that by persistent courage and undeviating thoroughness he reduced crime in Ireland to a vanishing point. His work was also constructive, for he broadened the basis of material prosperity and social progress by creating the Congested Districts Board in 1890. During this period, from 1886-92, moreover, he developed gifts of oratory which made him one of the most effective of public speakers. Impressive in matter rather than in manner of delivery, and seldom rising to the level of eloquence in the sense in which that quality was understood in a House which had listened to Bright and Gladstone, his speeches were logical and convincing, and their attractive literary form delighted a wider audience than that which listens to the mere politician.

In 1888 Mr Balfour served on the Gold and Silver Commission, currency problems from the standpoint of bimetalism being among the more academic subjects which had engaged his attention. On the death of Mr W. H. Smith in 1891 he became First Lord of the Treasury and leader of the House of Commons, and in that capacity introduced in 1892 a Local Government Bill for Ireland. The Conservative Government was then at the end of its tether, and the project fell through. For the next three years Mr Balfour led the Opposition with great skill and address. On the return of the Unionists to power in 1895 he resumed the leadership of the House, but not at first with the success expected of him, his management of the abortive education proposals of '96 being thought, even by his own supporters, to show a disinclination for the continuous drudgery of parliamentary management under modern conditions. But after the opening session matters proceeded more smoothly, and Mr Balfour regained his old position in the estimation of the House and the country. He had the satisfaction of seeing a Bill pass for providing Ireland with an improved system of local government, and took an active share in the debates on the various foreign and domestic questions that came before Parliament during 1895-1900. His championship of the Voluntary Schools, his adroit Parliamentary handling of the problems opened up by the so-called "crisis in the Church" caused by the Protestant movement against ritualistic practices, and his pronouncement in favour of a Roman Catholic University for Ireland—for which he outlined a scheme that met with much adverse criticism both from his colleagues and his party,—were the most important aspects of Mr Balfour's activity during these

years. His speeches and work throughout this period took a wider range than before his accession to the leadership of the Commons. During the illness of Lord Salisbury in 1898, and again in Lord Salisbury's absence abroad, he was in charge of the Foreign Office, and it fell to his lot to conduct the very critical negotiations with Russia on the question of railways in North China. To his firmness, and at the same time to the conciliatory readiness with which he accepted and elaborated the principles of a *modus vivendi*, the two Powers owed the avoidance of what threatened to be a dangerous quarrel. As a member of the Cabinet responsible for the Transvaal negotiations in 1899 he bore his full share of controversy, and during the war his high character and personal charm helped the Government over some awkward places, though in his attitude on the charges of hospital deficiency made by Mr Burdett Coutts, he permitted himself to depart from the suavity which had usually distinguished his conduct in the House. At the general election of 1900 he was returned for East Manchester (which he had represented since 1885) by a majority of 2453, and continued in office as First Lord of the Treasury. His leadership of the House of Commons in the first session of the new Parliament was marked by considerable firmness in the suppression of obstruction, but there was a slight revival of the criticisms which had been current in 1896. Mr Balfour's inability to get the maximum amount of work out of the House must, however, be regarded in relation to the situation in South Africa, which absorbed the intellectual energies of the House and of the country and impeded the progress of legislation. On the subject of the South African war Mr Balfour delivered, in the House and from the platform, various speeches which rank among his best oratorical efforts.

Besides the *Defence of Philosophic Doubt* Mr Balfour has published *Essays and Addresses* (1893) and *The Foundations of Belief, being Notes introductory to the Study of Theology*. He was made LL.D. of Edinburgh University in 1881; of St Andrews University in 1885; of Cambridge University in 1888; of Dublin and Glasgow Universities in 1891; Lord Rector of St Andrews University in 1886; of Glasgow University in 1890; Chancellor of Edinburgh University in 1891; Member of the Senate London University in 1888; and D.C.L. of Oxford University in 1891. He is a cultured musician and an enthusiastic golf player, having been captain of the Royal and Ancient Golf Club of St Andrews in 1894-95; his taste for cycling is attested by his presidency of the National Cyclists' Union, 1896.

Bali, an island E. of Java, Dutch East Indies, and separated from it by the Bali Strait. In 1882, for administrative purposes, it was separated from Java and combined with the island of Lombok to form the residency of Lombok and Bali. Politically its divisions are two: (1) the two districts, Buleleng and Jembrana, on Dutch territory; and (2) the autonomous states of Klung Kung, Bangli, Mengui, Badung, and Tabanan. Exploration of the island has proved its geological formation to include (as does that of Java) three regions, the central volcanic, the southern peninsula of Tertiary limestone, and alluvial plains between the older formations. The highest volcanoes, Tabanan, Batur, and Gunung Agung, have respectively the height of 7545, 7383, and 10,497 feet, the central chain having an average altitude of 3282 feet. The only roadstead safe all the year round is Temukus on the north coast. The rivers are not navigable. Agriculture is the chief means of subsistence. Rice is cultivated. Other crops grown for export are coffee, tobacco, cocoa, and indigo. Gold-working, the making of arms and

musical instruments, wood-carving, cotton, silk, and gold thread weaving are of importance. The value of the combined exports and imports of late years has been about £400,000-£500,000. The area of the island is 2240 square miles, the population on Dutch territory being 103,101, and in the autonomous states 1,259,135.

Balikisri, the chief town of the Karási sanjak, in Asia Minor, altitude 575 feet, situated on rising ground above a broad fertile valley which drains to the sea of Marmora. It is a centre of trade in opium, silk, and cereals. Population, 20,000 (Moslems, 15,000; Christians, 5000). The sanjak lies to the south of the sea of Marmora, and is fertile and well-watered. It is also rich in mineral wealth; silver mines are worked at Balia, and boracite mines at Susurlu.

Balkan Peninsula.—The Balkan Peninsula, formerly known as Turkey in Europe, is the most easterly of the three large peninsulas which form the southern extremities of the European continent. Its area is slightly greater than that of the Iberian peninsula, and somewhat less than twice that of Italy. Its northern boundary is generally regarded as marked by the courses of the rivers Danube, Save, and Kulpá; but may, perhaps, be more accurately defined by a line drawn from the Kilia mouth of the Danube to the northern extremity of the Adriatic near Trieste. On the east it is bounded by the Black Sea, the Sea of Marmora, and the Ægean; on the south by the Mediterranean; on the west by the Ionian Sea and the Adriatic. With the exception of the Black Sea coast and the Albanian littoral, its shores are considerably indented and flanked by groups of islands. The Peninsula in its general contour resembles an inverted pyramid or triangle, terminating at its apex in a subsidiary peninsula, the Peloponnesus, or Morea. Its surface is almost entirely mountainous, the only extensive plains being those formed by the valleys of the Danube and Maritza and the basin of Thessaly, drained by the Salambria (Peneus). The Danubian plain is enclosed by the Carpathians on the north, and the Balkans (from which the peninsula derives its name) on the south: these ranges form together the great semicircular mountain-chain, known as the anti-Dacian system, through which the Danube finds a passage at the Iron Gates. The other mountain-systems display great complexity of formation; beginning with the Dinaric Alps and the parallel ranges of Bosnia, they run, as a rule, from north-west to south-east: the great chain of Rhodope traverses the centre of the Peninsula, throwing out spurs towards the Black Sea and the Ægean; farther west are the lofty Shar Dagh and the mountains of Montenegro and Albania, continued by the Pindus range and the heights of Akarnania and Ætolia. The principal summits are Liubotrn in the Shar Dagh (3050 metres), Olympus, overlooking the Gulf of Salonika (2985 m.), Musallá (2924 m.), and Popova Shapka (2699 m.), both in the Rhodope system; Elin, in the Perin Planina (2681 m.); and Kiona in Ætolia (2511 m.). The geological formation has hitherto been imperfectly studied, especially in the districts under Turkish rule. Owing to the distribution of the mountain-chains the principal rivers flow in an easterly or south-easterly direction: the Danube falls into the Black Sea; the Maritza, Mesta, Struma (Strymon), Vardar, and Salambria into the Ægean. The only considerable rivers flowing into the Adriatic are the Narenta, Drin, and Viossa. The principal lakes are those of Okhrida, Prespa, Scutari, and Iannina. The climate is

more severe than that of the sister peninsulas, and the temperature is liable to sudden changes. The winter, though short, is often intensely cold, especially in the Danubian plain and in Thrace, the rigorous climate of which is frequently alluded to by the Latin poets. Bitter north-easterly winds prevail in the spring, and snow is not uncommon even in the low-lying districts of Greece.

(For further details with regard to the physical features, &c., see TURKEY, ninth edition, vol. xxiii. p. 653, and the articles there quoted; also BULGARIA in the present supplement.)

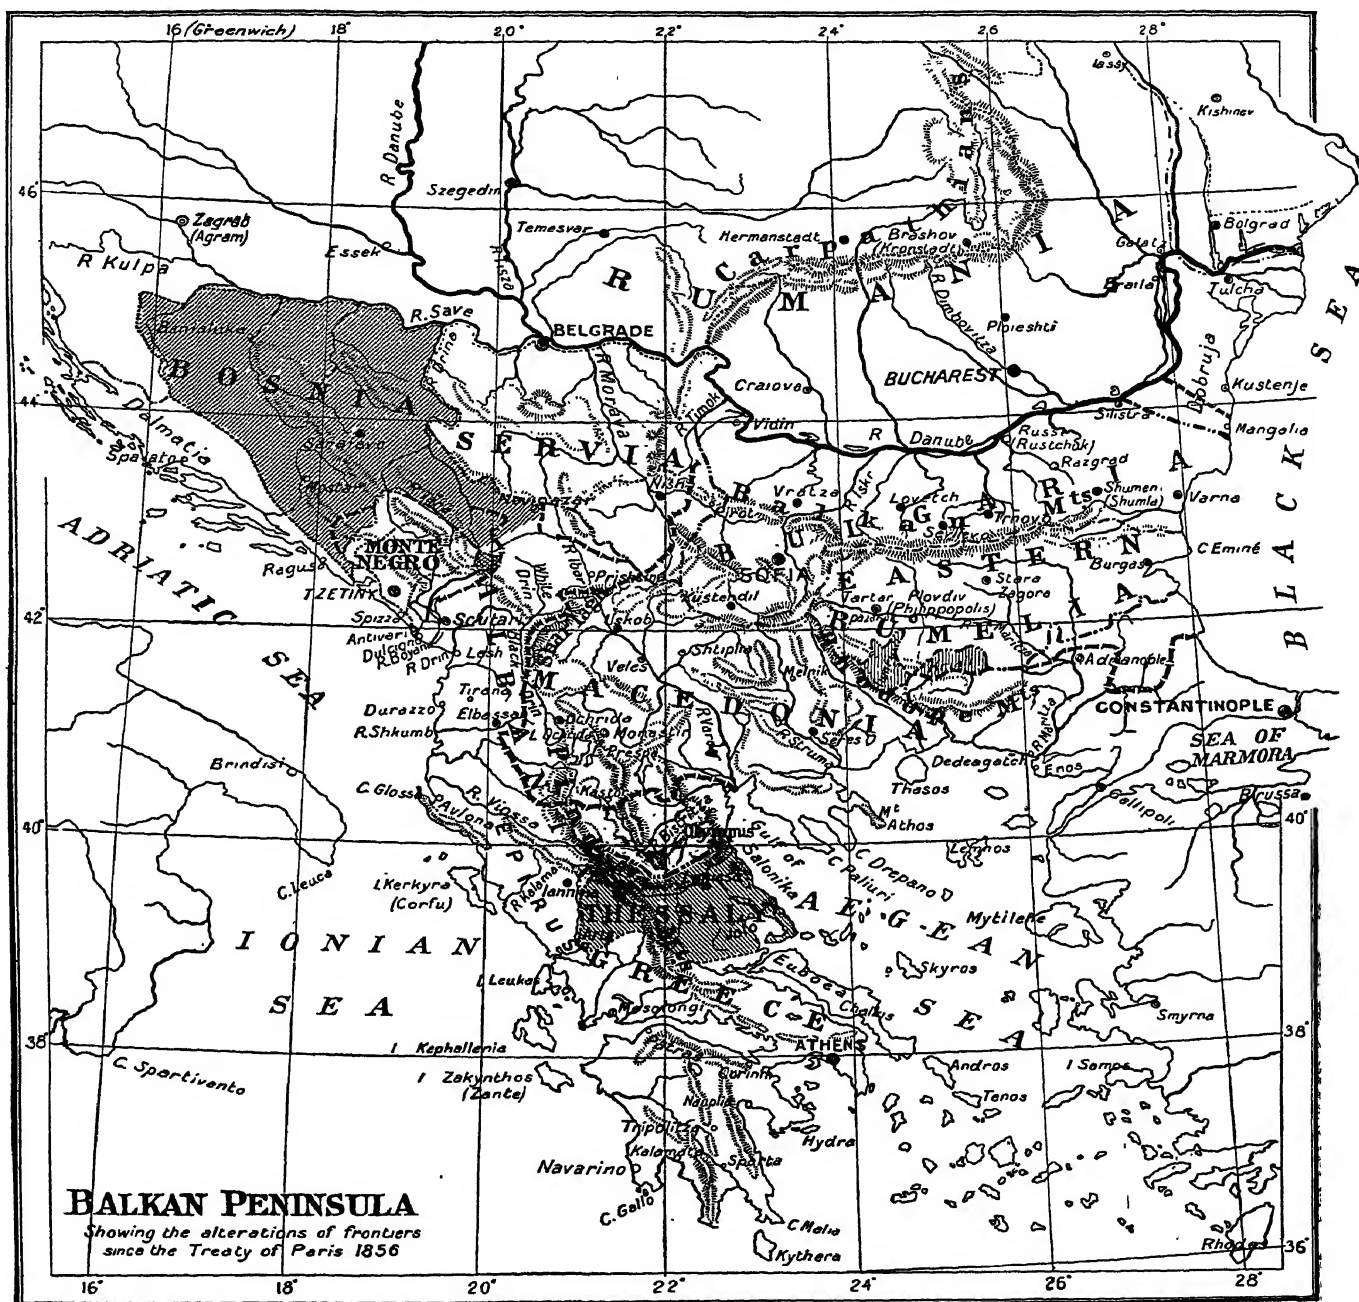

The following figures show the area and population of the various political divisions of the Balkan Peninsula. Among these it is customary to include the kingdom of Rumania, of which, however, only a small portion (the Dóbruja, pop. about 110,000) lies within the generally accepted limits.

	Area. sq. kilo.	Population.	Pop. per sq. kilo.
Turkish possessions (excluding Crete)	162,550	5,812,300	34
Rumania	131,020	5,417,249	41
Bulgaria (including Eastern Rumelia)	95,704	3,310,713	34·5
Servia	48,303	2,384,205	49
Montenegro	9,080	227,841	25
Greece	65,119	2,433,806	37
Bosnia and Herzegovina (under Austrian administration)	51,028	1,568,092	31
Novi-bazar (with three Austrian garrisons)	7,350	153,000	21
Dalmatia (Austro-Hungarian monarchy)	12,835	527,426	41
	582,989	21,834,632	37·4

The Peninsula is inhabited by a great variety of races, whose ethnological limits are far from corresponding with the existing political boundaries. The Turkish population, descended in part from the Ottoman invaders of the 14th and 15th centuries, in part from colonists introduced at various epochs from Asia by the Turkish Government, has considerably declined during the past century, especially in the countries withdrawn from the Sultan's authority. It is diminishing in Thessaly; it has entirely disappeared in the rest of Greece, almost entirely in Servia, and continues to decrease in Bulgaria notwithstanding the efforts of the authorities to check emigration. It is nowhere found in compact masses except in north-eastern Bulgaria and the region between Adrianople, the Black Sea, and the Sea of Marmora. Elsewhere it appears in separate villages and isolated districts, or in the larger towns and their immediate neighbourhood. The total Turkish population of the Peninsula scarcely exceeds 1,800,000. The Slavonic population, including the Serbs and Bulgars, is by far the most numerous; its total aggregate approaches 9,000,000. The Serbs, whose progenitors entered the Peninsula in the 6th century, inhabit Bosnia, Herzegovina, Montenegro, the kingdom of Servia, and the north-western portion of Macedonia, known as Old Servia. Their numbers, exclusive of the Serbo-Croats of Dalmatia (about 300,000), may be estimated at 4,500,000. The Bulgars, who descend from a fusion of the Slavonic element with a later Ugro-Finnish immigration, inhabit the principality of Bulgaria (including Eastern Rumelia), the Dóbruja, and the greater part of Macedonia, except Old Servia and the Ægean littoral. Apart from their colonies in Bessarabia and elsewhere, they may be reckoned at 4,100,000. Only a portion of the widely-spread Ruman or Vlach race, which extends over a great part of Transylvania, the Banat, and Bessarabia, as well as the Rumanian kingdom, falls within the limits of the Peninsula. It is found in numerous detached settlements in Macedonia, Albania, and northern Greece, and in colonies of recent date in Servia and Bulgaria. The nomad Vlakhs or Tzintzars of these countries call themselves *Arumani* or "Romans": they are either a remnant of the native Latinized population or descendants of Daco-Roman refugees, who fled southwards after the abandonment of Dacia by Aurelian. The entire Ruman population of the Balkan countries may be set down approximately at 5,600,000, of which 5,000,000 belong to the Rumanian kingdom. The Albanians, who call themselves *Shkipetar* or *Arber*, are the representatives of the primitive Illyrian population; they inhabit the Adriatic littoral from the southern frontier of Montenegro to the northern boundary of Greece, and are found in considerable numbers in the latter country. They have shown a tendency to advance in a north-easterly direction towards the Servian frontier, and the movement has been encouraged for

political reasons by the Turkish Government. The whole Albanian nation possibly numbers from 1,500,000 to 1,600,000. The Greeks, whose immigration from Asia Minor took place in pre-historic times, are, next to the Albanians, the oldest race in the Peninsula. Their maritime and commercial instincts have led them from the

earliest times to found settlements on the sea-coast and the islands. They inhabit the Black Sea littoral from Varna to the Bosphorus, the shores of the Sea of Marmora and the Ægean, the archipelago of the latter sea, the mainland of Greece, Epirus, and the western islands as far north as Corfu. In Constantinople they probably

SKETCH MAP OF THE BALKAN PENINSULA.

exceed 300,000. They are seldom found in large numbers at any great distance from the sea except in the principal towns and commercial centres, such as Adrianople, Braila, Galatz, and Philippopolis, and in detached colonies at Melnik, Stanimaka, Kavakli, Negush, and elsewhere. The Greek inhabitants of the Peninsula and adjacent islands probably number 4,500,000. The remainder of the population is for the most part composed of Armenians,

Jews, and gypsies. The Armenians, like the Greeks, congregated in the principal centres of trade, especially at Constantinople; their numbers were greatly reduced by the massacres of 1896. The Jews are most numerous in the Rumanian towns and at Salonika, where they form half the population: the Rumanian Jews belong to the Ashkenazim, the Macedonian and Bulgarian to the Sephardim. The gypsies are scattered widely throughout the Peninsula; they

are found not only in wandering troops, as elsewhere in Europe, but in settlements or cantonments in the neighbourhood of towns and villages.

Owing to the numerous conversions to Islam which followed the Turkish conquest, the Mahomedan population of the Peninsula is largely in excess of the purely Turkish element. More than half the Albanian nation and about two-fifths of the Serbs of Bosnia and Herzegovina adopted the creed of the conquering race. Among the Bulgars and Greeks the conversions were less numerous. The Bulgarian Mahomedans, or Pomaks, who inhabit the valleys of Rhodope and certain districts in northern Bulgaria, are numerically insignificant; the Greek followers of Islam are almost confined to Crete. The whole Moslem population of the Peninsula is about 3,300,000. The great bulk of the Christian population belongs to the Orthodox Church, of which the Œcumenical Patriarch at Constantinople is the nominal head, having precedence over all other ecclesiastical dignitaries. The Rumanian, Bulgarian, Servian, Montenegrin, and Greek churches are, however, in reality autocephalous. The Bulgarian church enjoys an exceptional position, inasmuch as its spiritual chief, the Exarch, who resides at Constantinople, controls the Bulgarian prelates in European Turkey as well as those in the principality of Bulgaria. On the other hand, the Greek prelates in Bulgaria are subject to the Patriarch. Religious and political questions are intimately connected in Eastern Europe. The heads of the various religious communities are the only representatives of the Christian population recognized by the Turkish Government; they possess a seat in the local administrative councils, and supervise the Christian schools. The efforts of the several branches of the Orthodox Church to obtain a separate organization in the Turkish dominions are to be attributed exclusively to political motives, as no difference of dogma divides them. The Serbo-Croats of Dalmatia, some of the Gheg tribes in Albania, a small proportion of the Bosnian Serbs, a still smaller number of Bulgarians in the Principality and Macedonia, and a few Greeks in the islands belong to the Catholic Church. A certain number of Bulgars at Kukush in Macedonia and elsewhere form a "uniate" church, which accepts the authority and dogma of Rome, but preserves the Orthodox rite and discipline. The Armenians are divided between the Gregorian and Uniate-Armenian churches, each under a patriarch. The other Christian confessions are numerically inconsiderable. The Gagausi in Eastern Bulgaria, a Turanian and Turkish-speaking race, profess Christianity.

Until comparatively recent times Turkish and Greek were the only languages systematically taught or officially recognized in the Balkan lands subject to Turkish rule. The former, the speech of the conquering race, was the official language; the latter, owing to the intellectual and literary superiority of the Greeks, their educational zeal, and the privileges acquired by their church, became the language of the upper classes among the Christians. The Slavonic masses, however, both Servian and Bulgarian, preserved their language, which saved these nationalities from extinction. The Serb dialect, extending into regions which escaped the Turkish yoke, enjoyed certain advantages denied to the Bulgarian: in free Montenegro the first Slavonic printing-press was founded in 1493; at Ragusa, a century later, Serb literature attained a high degree of excellence. The Bulgarian, for nearly four centuries, ceased to be a written language except in a few monasteries: a literary revival in recent times was the first symptom of returning national consciousness. In Rumania the Roman tongue of Trajan's colonists and the Latinized Dacians gave way in the Middle Ages to Slavonic under the rule of the Bulgarian Tsars; it revived under the Wallachian and Moldavian princes, but was not introduced into the liturgy and state documents till the middle of the seventeenth century. The Rumanian and the two Slavonic languages have borrowed largely from the Turkish in their vocabularies, but not in their structural forms, and have adopted many words from the Greek. The modern Greek has also a large number of Turkish words which are rejected in the artificial literary language. The revival of the various Balkan nationalities has in every case been accompanied or preceded by a literary movement; in Servian literature, under the influence of Obradovitch and Vuk Karajitch, the popular idiom, notwithstanding the opposition of the priesthood, superseded the ecclesiastical Russian-Slavonic; in Bulgaria the eastern dialect, that of the Sredna Gora, prevailed; in Rumania an artificial reconstruction on the Latin model with an elimination of all foreign elements was attempted and abandoned. Among the Greeks, whose literature never suffered a complete eclipse, a similar effort to restore the classical tongue has resulted in a kind of compromise; the conventional literary language, which is neither ancient nor modern, differs widely from the vernacular. The Albanian, the only surviving remnant of the ancient Thracian-Ilyrian speech, affords an interesting study to philologists. It undoubtedly belongs to the Indo-Germanic family, but its earlier forms cannot, unfortunately, be ascertained owing to the absence of literary monuments. Certain remarkable analogies between the Albanian and the other languages of the Peninsula, especially the Bulgarian and

Rumanian, have been supposed to point to the influence exercised by the primitive speech upon the idioms of the immigrant races.

At the beginning of the 19th century the whole Peninsula, with the exception of Dalmatia, Montenegro, and the Ionian Islands, formed a portion of the Ottoman Empire. The period of Turkish decadence had begun a century before, and the process of disintegration now set in. Owing to the unpromising character of the Mahomedan religion and the contemptuous attitude of the dominant race, the subject nationalities underwent no process of assimilation during the four centuries of Turkish rule; they retained not only their language but their religion, manners, and peculiar characteristics, and when the power of the central authority waned they still possessed the germs of a national existence. The independence of Greece was acknowledged in 1829, that of Servia (as a tributary principality) in 1830. No territorial changes followed the Crimean war except the restoration to Moldavia of Southern Bessarabia, which Russia had annexed in 1812; but the continuance of the weakened authority of the Porte tended indirectly to the independent development of the various nationalities. The Ionian Islands were ceded by England to Greece in 1864. The great break-up came in 1878. The abortive Treaty of San Stefano, concluded in that year, reduced the Turkish possessions in the Peninsula to Albania, Epirus, Thessaly, and a portion of southern Thrace. A large Bulgarian Principality was created extending from the Danube to the Ægean and from the Black Sea to the river Drin in Albania; it received a considerable coast-line on the Ægean, and abutted on the Gulf of Salonika under the walls of that town. At the same time the frontiers of Servia and Montenegro were enlarged so as to become almost contiguous, and the latter State received the ports of Antivari and Dulcigno on the Adriatic. From a strategical point of view the Bulgaria of the San Stefano treaty threatened Salonika, Adrianople, and Constantinople itself; and the Great Powers, anticipating that the new state would become a Russian dependency, refused their sanction to that instrument. The Treaty of Berlin followed, which limited the Principality to the country between the Danube and the Balkans, created the autonomous province of Eastern Rumelia south of the Balkans, and left the remainder of the proposed Bulgarian state under Turkish rule. The Montenegrin frontier laid down at San Stefano was considerably curtailed, Dulcigno, the district north-east of the Tara, and other territories being restored to Turkey; in addition to Nish, Servia received the districts of Pirot and Vranje on the east instead of the Ibar valley on the west; the Dóbruja, somewhat enlarged, was ceded to Rumania, which surrendered southern Bessarabia to Russia. Bosnia and Herzegovina were handed over to Austrian administration; under a subsequent convention with Turkey, Austria sent troops into the sanjak of Novi-bazar. The complete independence of the principalities of Servia, Rumania, and Montenegro was recognized. The claims of Greece, ignored at San Stefano, were admitted at Berlin; an extension of frontier, including Epirus as well as Thessaly, was finally sanctioned by the Powers in 1880, but owing to the tenacious resistance of Turkey the latter province only, together with the district of Arta, was acquired by Greece in 1881. Rumania was proclaimed a kingdom in that year, Servia in 1882. In 1880, after a naval demonstration by the Powers, Dulcigno was surrendered to Montenegro in compensation for the districts of Plava and Gusinye restored to Turkey. In 1886 the informal union of Eastern Rumelia with Bulgaria was sanctioned by Europe, the districts of Tumorush (Rhodope) and Krjali being given back to the Sultan. In 1897 Crete was withdrawn from Turkish administration,

Political changes.

and the Greco-Turkish war of that year was followed by the cession to Turkey of a few strategical points on the Thessalian frontier.

The liberation of the Balkan nationalities has in most cases been effected by the aid of one or more of the Great Powers, but their growth and independent development has, on the other hand, been retarded by the international jealousies arising from the Eastern Question. The possibility of the young states entering into a combination which would enable them to offer a united resistance to foreign interference while simultaneously effecting a compromise in regard to their national aims, has at various times occupied the attention of Balkan politicians. Among the earliest advocates of this idea was Ristitch, the Servian statesman. During the reaction against Russia which followed the war of 1877 informal discussions were conducted with this object, and it was even suggested that a reformed or constitutional Turkey might find a place in the confederation. The movement was favourably regarded by King Charles of Rumania and Prince Alexander of Bulgaria. But the revolt of Eastern Rumelia, followed by the Servo-Bulgarian war and the coercion of Greece by the Powers, embittered the rivalry of the various races, and the project was laid aside. It was revived in a somewhat modified form in 1891 by Tricoupis, who suggested an offensive alliance of the Balkan states, directed against Turkey and aiming at a partition of the Sultan's possessions in Europe. The scheme, which found favour in Servia, was frustrated by the opposition of Stambuloff, who denounced it to the Porte. In 1897 a Bulgarian proposal for joint pacific action with a view to obtaining reforms in Macedonia was rejected by Greece.

(J. D. B.)

Balkh, a city of Afghanistan, about 100 miles E. of Andkhoy and some 46 miles S. of the Oxus, in 37° N. lat. and 67° E. long. It comprises about 500 houses of Afghan settlers, a colony of Jews, and a small bazaar, set in the midst of a waste of ruins and many acres of débris. Entering by the west (or Akcha) gate, one passes under three arches, which are probably the remnants of a former Jamá Masjid. The outer walls (mostly in utter disrepair) are about 6½ to 7 miles in perimeter, and on the south-eastern borders are set high on a mound, or rampart, indicating a Mongol origin. The fort and citadel to the north-east are built well above the town on a barren mound, and are walled and moated. There is, however, little left but the remains of a few pillars. The Masjid Sabz, with its green-tiled dome, is said to be the tomb of a Khwaja, Abul Narsi Parsar. Nothing but the arched entrance remains of the Madrasa, which is traditionally not very old. The earlier Buddhist constructions have proved more durable than the Mahomedan buildings. The Top-i-Rustam is 50 yards in diameter at the base and 30 yards at the top, circular, and about 50 feet high. Four circular vaults are sunk in the interior, and four passages have been pierced below from the outside, which probably lead to them. The base of the building is constructed of sun-dried bricks about 2 feet square and 4 or 5 inches thick. The Takht-i-Rustam is wedge-shaped in plan, with uneven sides. It is apparently built of pisé mud (i.e., mud mixed with straw and puddled). It is possible that in these ruins we may

recognize the Nan Vihara of the Chinese traveller Hwen Thsung. There are the remains of many other topeś (or stupas) in the neighbourhood. The mounds of ruins on the road to Mazar probably represent the site of a city yet older than those on which stands the modern Balkh. The town is garrisoned by a few hundred kasidars, the regular troops of Afghan Turkestan being cantoned at Takht-i-Pul, near Mazar. The gardens to the north-east contain a caravanserai, which is fairly well kept and comfortable. It forms one side of a courtyard, which is shaded by a group of magnificent chenar trees. (T. H. H.*)

Balkhash (Kirghiz, *Ak- or Ala-Denghiz*), a great lake of Russia, in the Kirghiz Steppes, between the provinces of Semipalatinsk and Semirychensk, in 45° to 47° N. and 74° to 78° E., about 550 miles to the east of Lake Aral. It is fourth in size in Eurasia, and has an area of 8610 square miles, and an altitude of 900 feet. It has the shape of a broad crescent, about 280 miles long from W.S.W. to E.N.E., having its concave side turned southwards; its width is 55 miles in the west, narrowing to 10 miles eastward. Its north-western shore is occupied by a dreary plateau, known as the Famine Steppe (*Bekpak-dala*) in its southern portion. The south-east shore is, on the contrary, low, and bears traces of a former much greater extension of the lake in that direction. Its desiccation proceeds rapidly, a lowering of the level of three feet having been noticed in the course of fourteen or fifteen years. The chief tributary of the lake is the Ili, which rises in the high Khan-tengri group of the Tian Shan. The Karatal, the Aksu, and the Lepsa also enter the lake from the south-east, and the Ayaguz from the north-east. In their lower courses the first three rivers make their way with difficulty through the sands and rushes, which at a quite recent time were covered by the lake; while it also undoubtedly extended farther east so as to include the group of lakes Sasyk-kul and Ala-kul. The water of the lake is saltier along its north-western than along its south-eastern shores. It freezes for four and a half months every year. Its greatest depth, 135 feet, is also along the north-west shore. The fauna of the lake and of its tributaries—explored by Nikolsky—is more akin to the fauna of the rivers of the Tarim basin than to that of the Aral; it also does not contain the common frog. It seems, therefore, probable that Lake Balkhash stood formerly in communication—through the lakes Ebi-nor, Ayar, &c., with the lake that formerly filled the Lukchun depression, but researches show that a connexion with Lake Aral—at least, at a recent time—was improbable.

Ball, John (1818-1889), Irish politician, naturalist, and Alpine traveller, son of an Irish judge, was born at Dublin, 20th August 1818. He was educated at Oscott and Christ's College, Cambridge. He showed in early years a taste for natural science, particularly botany; and after leaving Cambridge he travelled in Switzerland and elsewhere in Europe, studying his favourite pursuits, and contributing papers on botany and the Swiss glaciers to scientific periodicals. In 1846 he was made an assistant poor-law commissioner, but resigned in 1847, and stood unsuccessfully as a parliamentary candidate for Sligo. In 1849 he was appointed second poor-law commissioner, but resigned in 1852 and successfully contested the county of Carlow in the Liberal interest. In the House of Commons he attracted Lord Palmerston's attention by his abilities, and was made under-secretary for the colonies, a post which he held for two years. At the Colonial Office he had great influence in furthering the cause of natural science, particularly in connexion with the equipment of the Palliser expedition in Canada, and with Sir W. Hooker's efforts to obtain a systematic knowledge of

the colonial floras. In 1858 he stood for Limerick, but was beaten, and he then gave up politics and devoted himself to natural history. He was first president of the Alpine Club (founded 1857), and it is for his work as an Alpinist that he is now remembered, his well-known *Alpine Guide* (1863-68) being the result of innumerable climbs and journeys and of careful observation recorded in a clear and often entertaining style; he wrote the article ALPS in the ninth edition of the *Ency. Brit.* He also travelled in Morocco (1871) and South America (1882), and recorded his observations in books which were recognized as having a scientific value. He died 21st October 1889.

Ballance, John (1839-1893), New Zealand statesman, eldest son of Samuel Ballance, farmer, of Glenavy, Antrim, Ulster, was born on 27th March 1839. He was educated at a national school, and, on leaving, was apprenticed to an ironmonger at Belfast. Thereafter he was clerk in a wholesale ironmonger's house in Birmingham, and migrated to New Zealand, intending to start in business there as a small jeweller. After settling at Wanganui, however, he took an opportunity, soon offered, of founding a newspaper, the *Wanganui Herald*, of which he became editor, and remained chief owner for the rest of his life. During the fighting with the Maori chief Titokowaru, in 1867, Ballance was concerned in the raising of a troop of volunteer horse, in which he received a commission. Of this he was deprived owing to the appearance in his newspaper of articles criticizing the management of the campaign. He had, however, behaved well in the field, and, in spite of his dismissal, was awarded the New Zealand war medal. He entered the colony's parliament in 1875 and, with one interval (1881-84), sat there till his death. Ballance was a member of three ministries, that of Sir George Grey (1877-79); that of Sir Robert Stout (1884-1887); and that of which he himself was premier (1891-93). His alliance with Grey ended with a notorious and very painful quarrel. In the Stout government his portfolios were those of lands and native affairs; but it was at the Treasury that his prudent and successful finance made the chief mark. As native minister his policy was pacific and humane, and in his last years he contrived to adjust equitably certain long-standing difficulties relating to reserved lands on the west coast of the North Island. He was resolutely opposed to the sale of Crown lands for cash, and advocated with effect their disposal by perpetual lease. His system of State-aided "village settlements," by which small farms were allotted to peasants holding by lease from the Crown, and money lent them to make a beginning of building and cultivation, has been on the whole successful. To Ballance, also, was due the law reducing the life-tenure of legislative councillors to one of seven years. He was actively concerned in the advocacy of woman suffrage. But his best known achievement was the imposition, in 1891, of the progressive land-tax and progressive income-tax still levied in the colony. As premier he brought together the strong experimental and progressive party which in 1901 still held office in New Zealand. In office he showed debating power, constructive skill, and tact in managing men; but in 1893, at the height of his success and popularity, he died at Wellington of an intestinal disease after a severe surgical operation. Quiet and unassuming in manner, Ballance, who was a well-read man, always seemed fonder of his books and his chessboard than of public bustle; yet his loss to his party was great, and the mark he left on New Zealand politics bids fair to be enduring. A statue has been erected to his memory in front of Parliament House, Wellington.

(W. P. R.)

Ballantine, William (1812-1887), English barrister, was born 3rd January 1812, being the son of a London police-magistrate. He was educated at St. Paul's School, and called to the Bar in 1834. He began in early life a varied acquaintance with dramatic and literary society, and his experience, combined with his own pushing character and acute intellect, helped to obtain for him very soon a large practice, particularly in criminal cases. He became known as a formidable cross-examiner, his great rival being Serjeant Parry. The three great cases of his career were his successful prosecution of the murderer Franz Müller in 1864, his skilful defence of the Tichborne claimant in 1871, and his defence of the Gaekwar of Baroda in 1875, his fee in this last case being one of the largest ever known. Ballantine became a serjeant-at-law in 1856. He died on 9th January 1887, having previously published more than one volume of reminiscences. Serjeant Ballantine's private life was decidedly Bohemian; and though he earned large sums, he died very poor.

Ballantyne, Robert Michael (1825-1894), Scottish writer of fiction, was born at Edinburgh on 24th April 1825, and came of the same family as the famous printers and publishers. When sixteen years of age he went to Canada, and was for six years in the service of the Hudson Bay Company. He returned to Scotland in 1847, and next year published his first book, recording his experiences in the "Wilds of North America." For some time he was employed by Messrs Constable, the publishers, but in 1856 he gave up business for the profession of literature, and began the series of enjoyable stories of adventure for the young with which his name is popularly associated. *The Coral Island, The World of Ice, The Young Fur-Traders, Ungava, The Dog Crusoe, The Lighthouse, Deep Down, The Pirate City, Erling the Bold, The Settler and the Savage*, and other books, to the number of upwards of a hundred, followed in regular succession, his rule being in every case to write as far as possible from personal knowledge of the scenes he described. His stories had the merit of being thoroughly healthy in tone, with considerable graphic force. Ballantyne was also no mean artist, and exhibited some of his water-colours at the Royal Scottish Academy. He lived in later years at Harrow, and died on 8th February 1894, at Rome, where he had gone to attempt to shake off the results of overwork.

Ballarat and BALLARAT EAST, a city and a town of Victoria, Australia, in the county of Grenville, 74 miles by rail W.N.W. of Melbourne, divided by the Yarrowee creek. The former is the second city and chief goldfield town of the state. These municipalities are in the centre of the richest alluvial goldfields ever opened up, but the yield has greatly declined, and gold is now chiefly obtained by quartz crushing, the deep levels giving a fair return. The total output of gold for the district in 1899 was 208,920 ozs. It is an important railway centre, from which six lines branch, and has iron foundries, woollen mills, and other factories. There are several recreation grounds, including the Botanic Gardens. Connected with the latter is a lake of 600 acres, where pisciculture is carried on with great success. Altitude, 1438 feet. Mean temperature for the year, 55·2° F.; for January, 66·7° F.; July, 43·5° F.; rainfall (17 years), 27 inches. The population of the city of Ballarat was in 1901, 25,448; of the town of Ballarat East in 1901, 18,262.

Ballet. See SPECTACLE.

Ballia, a town and district of British India, in the Benares division of the North-West Provinces. The town

is situated on the left bank of the Ganges, below the confluence of the Lesser Sarju. It is really an aggregate of rural villages. Population about 16,500; municipal income in 1897-98, Rs.10,482.

The district of BALLIA, constituted in 1879, occupies an angle at the junction of the Gogra with the Ganges, being bordered by two districts of Behar. It contains an area of 1170 square miles. The population in 1891 was 995,325, being 936 persons per square mile; Hindus numbering 926,358, Mahommedans 68,952, Christians 15, of whom 7 were Europeans. In 1901 the population was 949,966, showing a decrease of 5 per cent. Land revenue and rates were returned as Rs.8,75,449, the incidence of assessment (which is permanently settled) being Rs.0:14:3 per acre; the number of police was 2740. There are no canals and no railways. Out of a total cultivated area in 1896-97 of 510,828 acres, 157,443 were irrigated from wells, tanks, &c. The principal crops are rice, barley, other food-grains, pulse, sugar-cane, and opium. There are no manufactures, except that of sugar; and trade is almost entirely carried on by the two bordering rivers.

Ballina, a maritime town, urban sanitary district of county Mayo, Ireland, on the river Moy and the Midland Great Western Railway. In population and trade it is the first town in the county. Salmon fisheries gave employment in 1898 to 547 persons. A light railway now runs from Ballina to Killala. Population, 4846.

Ballinasloe, an inland town and urban sanitary district in the province of Connaught, county of Galway, Ireland, on the river Suck, 91 miles W.S.W. of Dublin by the Midland Great Western Railway. In 1898 the portion in Roscommon was added to Galway. The number of sheep offered for sale at the great October fair in 1900 was 28,360, and of horned cattle, 11,294. Population about 4700.

Balloons, Military.—When, in 1783, Montgolfier first caused a balloon to rise in the air, and to lift a man to a considerable height, whence an extensive view of the surrounding country could be obtained, military authorities were not slow to recognize the immense benefits which the employment of such a contrivance might confer in war. Within the next ten years the French Government made trials, resulting in the establishment of a company of "Aëroliers," suitably equipped with several balloons, and these proved of great service during the campaigns of that period. In June 1794, Captain Coutelle made an ascent at Maubeuge. At the battle of Fleurus the balloon was up all day and valuable observations were made from it. A second company of "Aëroliers" was then formed, and frequent ascents were made. At the siege of Mayenne in 1799, Coutelle ascended during a very strong wind, but was able to gain important information. Balloon observations were also made at Ehrenbreitstein, Bonn, Frankfurt, Würzburg, and at the siege of Liège. It may seem curious that after such an apparently successful début military ballooning should have died out of fashion. With the exception of an ascent at the siege of Antwerp in 1815, and one at Solferino in 1859, balloons were not again used in war until the Federals brought them into requisition in the American civil war of 1861. Much valuable information was thus gained of the enemy about Richmond and in other places. Though during the Franco-German war in 1870 balloons were occasionally used, no regular organization was instituted, nor were important results obtained until the siege of Paris, when the French made great use of them for sending out letters and carrier pigeons. Sixty-four large balloons were sent off, taking nearly a ton of letters. Yet it may be said

that ballooning as a recognized military science only dates back to about the year 1883 or 1884, when most of the powers organized regular balloon establishments. In 1884-85 the French found balloons very useful during their campaign in Tongking; and the British Government also despatched balloons with the Bechuanaland expedition and also with that to Suakin in those years. During the latter campaign several ascents were made in the presence of the enemy, on whom it was said that a great moral effect was produced. In the war against the Spaniards in Cuba the United States again used a balloon, but it was carried so close to the enemy's lines that it was soon shot down, after drawing the enemy's fire upon the troops. Balloons were employed in the South African war of 1899-1902 with useful results.

Apparatus.—We may briefly describe the apparatus used in military operations. The French in the campaigns of the last century used varnished silk balloons of about 10,000 cubic feet capacity. The Americans in the civil war used much larger ones, those of 26,000 cubic feet being found the most suitable. These were also of varnished silk. In the present day most nations use balloons of about 20,000 cubic feet, made of varnished cambric; but the British war balloons, made of goldbeater skin, are usually of comparatively small size, the normal capacity being 10,000 cubic feet, though others are also used of 7000 and 4500 cubic feet, the latter two sizes having been used at Suakin. The usual shape is spherical; but since 1896 the Germans, and now other nations, have adopted a long, cylindrical-shaped balloon, so affixed to its cable as to present an inclined surface to the wind and thus act partly on the principle of a kite.

Though coal-gas and even hot air may occasionally be used for inflation, hydrogen gas is on account of its lightness far preferable. In the early days of ballooning this had to be manufactured in the field, but nowadays it is almost universally carried compressed in steel tubes. About 100 such tubes, each weighing 75 lb, are required to fill a 10,000-foot balloon. New tubes of greater capacity have also been tried.

The transport for a British balloon section consists of 6 four-horsed waggons, 1 carrying the balloon with its steel wire captive rope, 4 for gas tubes, and 1 for equipment. The *personnel* consists of 3 officers and 25 rank and file. These all belong to the Royal Engineers.

The balloon is almost always used *captive*. If allowed to go free it will usually be rapidly carried away by the wind, and the results of the observations cannot easily be transmitted back. Occasions may occur when such ascents will be of value, but the usual method is to send up a captive balloon to a height of somewhere about 1000 feet. With the standard British balloon two officers are sent up, one of whom has now particularly to attend to the management of the balloon, while the other makes the observations.

With regard to observations from captive balloons much will depend on circumstances. In a thickly wooded country, such as that in which the balloons were used in the American civil war, no very valuable information is, as a rule, to be obtained; but in fairly open country all important movements of troops should be discernible by an experienced observer at any point within about four or five miles of the balloon. The circumstances, it may be mentioned, are such as would usually preclude one unaccustomed to ballooning from affording valuable reports. Not only is he liable to be disturbed by the novel and apparently hazardous situation, but troops and features of the ground often have so peculiar an appearance from that point of view, that a novice will often have a difficulty in deciding whether an object be a column of troops or a ploughed field. Then again, much will depend on atmospheric conditions. Thus, in misty weather a balloon is well-nigh useless; and in strong winds, with a velocity of anything over 20 miles an hour, efficient observation becomes a matter of difficulty. When some special point has to be reported on, such as whether there is any large body of troops behind a certain hill or wood, a rapid ascent may still be made in winds up to 30 miles an hour, but the balloon would then be so unsteady that no careful scouting could be made. It is usually estimated that a successful captive ascent can only be made in England on half the days of the year. As a general rule balloon ascents would be made for one of the following objects, viz.: to examine the country for an enemy; to reconnoitre the enemy's position; to ascertain the strength of his force, number of guns, and exact situation of the various arms; also to note the plan of his earthworks or fortifications. During an action the aerial observer would be on the look-out for any movements of the enemy and give warning of flank attacks or surprises. Such an observer could also keep the general informed as to the progress of various detached parties of his own force, as to the advance of reinforcements, or to the conduct of any fighting going

on at a distance. Balloon observations are also of especial aid to artillery in correcting their aim.

The vulnerability of a captive balloon to the enemy's fire has been tested by many experiments with variable results. One fact undoubtedly is that the range of a balloon in mid-air is extremely difficult to judge, and, as its altitude can be very rapidly altered, it becomes a very difficult mark for artillery to hit. A few bullet holes in the fabric of a balloon make but little difference, since the size of the perforation is very minute as compared with the great surface of material, but on the other hand, a shrapnel bursting just in front of it may cause a rapid fall. It is therefore considered prudent to keep the balloon well away from an enemy, and two miles are laid down as the nearest approach it should make habitually.

Besides being of use on land for war purposes, balloons have also been tried in connexion with the naval service. In France especially regular trials have been made of inflating balloons on board ships, and sending them aloft as a look-out; but it is now generally contended that the difficulties of storing the gas and of manœuvring the balloon are so great on board ship as to be hardly worth the results to be gained.

A very important development of military ballooning—which, however, has not yet passed the experimental stage—is that of the navigable balloon. If only a balloon could be sent up and driven in any required direction, and brought back to its starting-point, it is obvious that it would be of the very greatest use in war. The French, here again, were the first to make practical efforts to accomplish this end. Giffard, a civil engineer, as long ago as 1852, ascended in an elongated balloon with a steam engine to work a screw propeller. The speed attained was, however, not sufficient to be of any practical use, since, of course, the rate of progress must be greater than that of the wind in order to make certain of returning to the point of departure. Dupuy de Lôme, constructor to the French navy, undertook further experiments in this line for the Government in 1872, but without much more satisfactory results. In 1884, however, Captains Renard and Krebs, of the military balloon establishment at Meudon, succeeded in making and working a balloon, called "La France," with electric engines, which on several occasions attained a speed of about 14 miles an hour; and this was sufficient, so long as the wind was very light, to enable it to travel some miles and return to its point of departure. Though there have been frequent rumours of this balloon having been improved upon, nothing definite seems to have really resulted. Several further attempts to solve the problem have been made in Germany and other countries without much success. Count Zeppelin's air-ship in 1900 promised better results. Having a capacity of over 350,000 cubic feet, it could carry about thirty men, and was estimated to travel at the rate of 22 miles an hour. (See also AERONAUTICS.) This huge vessel was kept distended by an aluminium framework, and was driven by two benzine motors of 15 horse-power each, rotating four screw propellers placed at the sides of the vessel.

(B. F. S. B.-P.)

Ballot.—The history of the ballot in the United Kingdom, generally, was treated in the ninth edition of this work, but it is desirable here to give further particulars concerning its use in the United States. At the first elections in America voting was *viva voce*; but several of the colonies early provided for the use of written or printed ballots. By 1775 ballots were used in the New England states, in Pennsylvania, Delaware, North Carolina, and South Carolina; they were introduced in New Jersey in 1776 and in New York in 1778, so that, at the time the Constitution of the United States was adopted, *viva voce* voting prevailed at public elections only in Maryland, Virginia, and Georgia. Of the new states which later entered the Union, only Illinois, Kentucky, Missouri, and Arkansas did not have a ballot system when they became states. During the first half of the 19th century, Maryland, Georgia, Arkansas (1846) and Illinois (1848) adopted the ballot. In Missouri ballot voting was introduced to some localities in 1845, but not until 1863 was it generally adopted in that state. Virginia did not provide for voting by ballot until 1869, and in Kentucky *viva voce* voting continued until 1891. But while the use of ballots was thus required in voting, and most of the states had laws prescribing the form of ballots and providing for the count of the vote, there was no provision making it the duty of any one to print and distribute the ballots at the polling places on election day. In the

primitive town meetings ballots had been written by the voters, or, if printed, were furnished by the candidates. With the development of elections, the task of preparing and distributing ballots fell to political committees for the various parties. The ballot tickets were thus prepared for party lists of candidates, and it was not easy for any one to vote a mixed ticket, while, as the voter received the ballot within a few feet of the polls, secrecy was almost impossible, and intimidation and bribery became both easy and frequent.

Soon after the adoption of the Australian ballot in Great Britain, it was introduced in Canada, but no serious agitation was begun for a similar system in the United States until 1885. In 1887 bills for the Australian ballot were actively urged in the legislatures of New York and Michigan, although neither became law. A Wisconsin law of that year, regulating elections in cities of over 50,000 population, incorporated some features of the Australian system, but the first complete law was enacted by Massachusetts in 1888. This Massachusetts statute provided for the printing and distribution of ballots by the state to contain the names of all candidates arranged alphabetically for each office, the electors to vote by marking the name of each candidate for whom they wished to vote. At the Presidential election of 1888 it was freely alleged that large sums of money had been raised on an unprecedented scale for the purchase of votes, and this situation created a feeling of deep alarm which gave a powerful impetus to the movement for ballot reform. In 1889 new ballot laws were enacted in nine states: two states bordering on Massachusetts, Connecticut and Rhode Island; four states in the middle-west, Indiana, Michigan, Wisconsin, and Minnesota; two southern states, Tennessee and Missouri; and Montana, in the far west. The Connecticut law, however, marked but little improvement over former conditions, since it provided only for official envelopes in which the unofficial party ballots should be voted. The Indiana law provided for a single or "blanket" ballot, but with the names of candidates arranged in party groups, and a method of voting for all of the candidates in a party group by a single mark. Michigan and Missouri also adopted the party group system. The other states followed the Massachusetts law providing for a blanket ballot with the candidates arranged by offices.

The new ballot system had its first practical demonstration at the Massachusetts election of 1889, and its success led to its rapid adoption in many other states. In 1890 ballot laws were passed in seven states: Vermont, Mississippi, Wyoming, and Washington provided for the Massachusetts plan, although Vermont afterwards adopted the system of party groups, which Maryland used from the first. The New York and New Jersey laws of 1890, however, only provided for official ballots for each party, and allowed ballots obtained outside of the polling booths to be used. In 1891 seventeen additional states and two territories adopted the Australian ballot system. All of these provided for a blanket ballot; but while the Massachusetts arrangement was adopted in Arkansas, Nebraska, New Hampshire, North and South Dakota, Kentucky, Texas, and Oregon, the system of party groups was followed in Colorado, Delaware, Illinois, Maine, Ohio, Pennsylvania, and West Virginia. California had the Massachusetts arrangement of names, but added on the ballot a list of party names, by marking one of which a voter would cast his vote for all of the candidates of that party. Pennsylvania placed all the candidates not in a party group in alphabetical order.

Iowa adopted the Australian ballot system in 1892; Alabama and Kansas in 1893; Virginia in 1894; Florida

in 1895; and in 1896 Louisiana and Utah. In 1895, too, New York adopted the blanket ballot in place of separate party ballots, but arranged the names of candidates in party columns. The only state to abandon the Australian ballot after once adopting it has been Delaware, which in 1898 returned to the system of separate ballots, with no provision for booths where the ballot might be marked in secret. Up to 1901 four other states had not yet adopted the Australian ballot, viz., North Carolina, South Carolina, Georgia, and Nevada.

Owing to the large number of officials chosen at one time in American elections, the form and appearance of the ballot used is very different from that in Great Britain. At the quadrennial presidential election in New York state, for example, the officers to be voted for by each elector are thirty-six presidential electors, one congressman, state governor, lieutenant-governor, and five other state officers, a member for each house of the state legislature, several judges, a sheriff, county clerk, and other county officers. The column with the list of the candidates of each party for all of these offices is two to three feet in length; and as there are often eight to ten party tickets in the field, the ballot paper is usually from 18 to 20 inches in width. Each voter receives one of these "blanket" ballots on entering the polling place, and retires to a booth to mark either a party column or the individual candidates in different columns for whom he wishes to vote. Where, as in Massachusetts, the names of candidates are arranged by offices instead of in party lists, every voter must mark the name of each individual candidate for whom he wishes to vote. Connecticut, New Jersey, and Delaware continue to use the system of separate party ballots, the voter selecting the ballot he wishes to vote, on which he can write any changes he may wish to make. (See also the article VOTING MACHINE.)

(J. A. FA.)

Ballston Spa, capital of Saratoga county, New York, U.S.A., situated in the eastern part of the State, in 43° 00' N. lat., and 73° 51' W. long., on the Delaware and Hudson Railway, at an altitude of 294 feet. It contains fine chalybeate springs, which attract a large number of visitors every summer. Population (1880), 3031; (1890), 3527; (1900), 3923.

Ballycastle, a seaport and watering-place in the county of Antrim, Ireland, on a bay of the same name opposite Rathlin Island. The town is now connected with Ballymoney by a light railway. In 1899, 134 vessels were registered in the fishing district, employing 284 hands. Population (1891), 1481; (1901), 1476.

Ballymena, an inland town and urban sanitary district in the county of Antrim, Ireland, on the river Braid and the Belfast and Northern Counties Railway, 33 miles N.N.W. of Belfast. The value of brown linens alone produced annually averages £1,000,000. There are frequent markets and fairs. Light railways now run from Ballymena to Larne, 23 miles distant, and to Parkmore, 13 miles distant. Population (1901), 10,880.

Balmaceda, Jose Manuel (1838-1891), President of the republic of Chile, was born in Santiago in 1838. His parents were wealthy, and in his early days he was chiefly concerned in industrial and agricultural enterprise. In 1865 he was one of the representatives of the Chilean Government at the general South American congress at Lima, and after his return took an active part in the proceedings of the National Assembly, obtaining great distinction as an orator. After discharging some diplomatic missions abroad he became successively minister of foreign affairs and of the interior under the presidency of

Señor Santa Maria, and in the latter capacity carried compulsory civil marriage and several other legislative measures highly obnoxious to the clergy. In 1886 he was elected president. It soon appeared that he was irreconcilably at variance with the majority of the Assembly, and refusing to accept the alternative "*se soumettre ou se demettre*," prescribed by Gambetta to Marshal MacMahon, on 1st January 1891 he sought to terminate an intolerable situation by the desperate remedy of a *coup d'état*, refusing to convoke the Assembly, and ordering the continued collection of the taxes on his own authority. A week afterwards the navy revolted almost *en masse*, and the unprecedented spectacle was seen of the legal representatives of the nation huddled together in a small port at the northern extremity of the republic—safe, however, under the protection of the fleet,—while the executive retained the allegiance of the army, and was apparently obeyed throughout the rest of the country. So matters continued until August, when the party of the Assembly, having completed their preparations, disembarked at Coquimbo, and with some assistance from treachery overthrew Balmaceda's troops in the two desperate battles of Conchon, 21st August, and Placilla, 28th August. The unfortunate president, abandoned by all, committed suicide on 18th September, the anniversary of his elevation. Seldom has there been a more forcible illustration of the maxim that the master of the sea is also master of the land; and the contest is further memorable as definitively establishing the parliamentary régime in Chile. Balmaceda was a capable and probably a well-intentioned man, but his imperious character disqualified him for the first place in a free state. (See also CHILE.) (R. G.)

Balrampur, a town of British India, in the Gonda district of Oudh, which gives its name to one of the largest *talukdari* estates in the province. The raja was conspicuously loyal during the Mutiny, and was rewarded with accessions of territory and hereditary privileges. His death gave rise to prolonged litigation, and the estate was recently under the court of wards. The income is estimated at Rs.18,00,000, paying a revenue of Rs.7,00,000. Numerous schools and hospitals are supported. The town of Balrampur is situated in 27° 25' N. lat. and 82° 13' E. long., near the river Rapti, 28 miles from Gonda; railway station. Population about 15,000; municipal income (1897-98), Rs.5756. Balrampur contains a large palace, handsome new temple, an Anglo-vernacular school, and a printing-press.

Baltic Sea.—The Baltic Sea (*Ostsee* of the Swedes, Danes, and Germans, *Baltiškoye Morye* of the Russians) lies between 54° and 66° N. lat., and 9° and 30° E. long.; it is surrounded by the territories of Sweden, Russia, Germany and Denmark. Its greatest length is about 960 miles; greatest breadth, about 400 miles; and length of coast-line, 5000 miles. Its central axis runs approximately from south-west to north-east. The Baltic is connected with the North Sea by the winding channel between the south of Scandinavia and the Cimbrian peninsula. This channel is usually included in the Baltic. The part of it west of a line joining the Skaw with Christiania fjord receives the name of Skagerrak; east of this line the channel is called the Kattegat. At its southern end the Kattegat is blocked by the Danish islands, and it communicates with the Baltic proper by narrow channels called the Sound, the Great Belt, and the Little Belt. The real physical boundary between the North Sea and the Baltic is formed by the plateau on which the islands Zealand, Funen, and Laaland are situated, and its prolongation from the islands Falster and Møen to the coasts of Mecklenburg and Rugen.

East of this line the Baltic proper forms a series of

hollows or troughs. The first, or Bornholm deep, lies east of the island of Bornholm, and is separated from the next, or "Gothland" deep, by the "Middelbank." Beyond

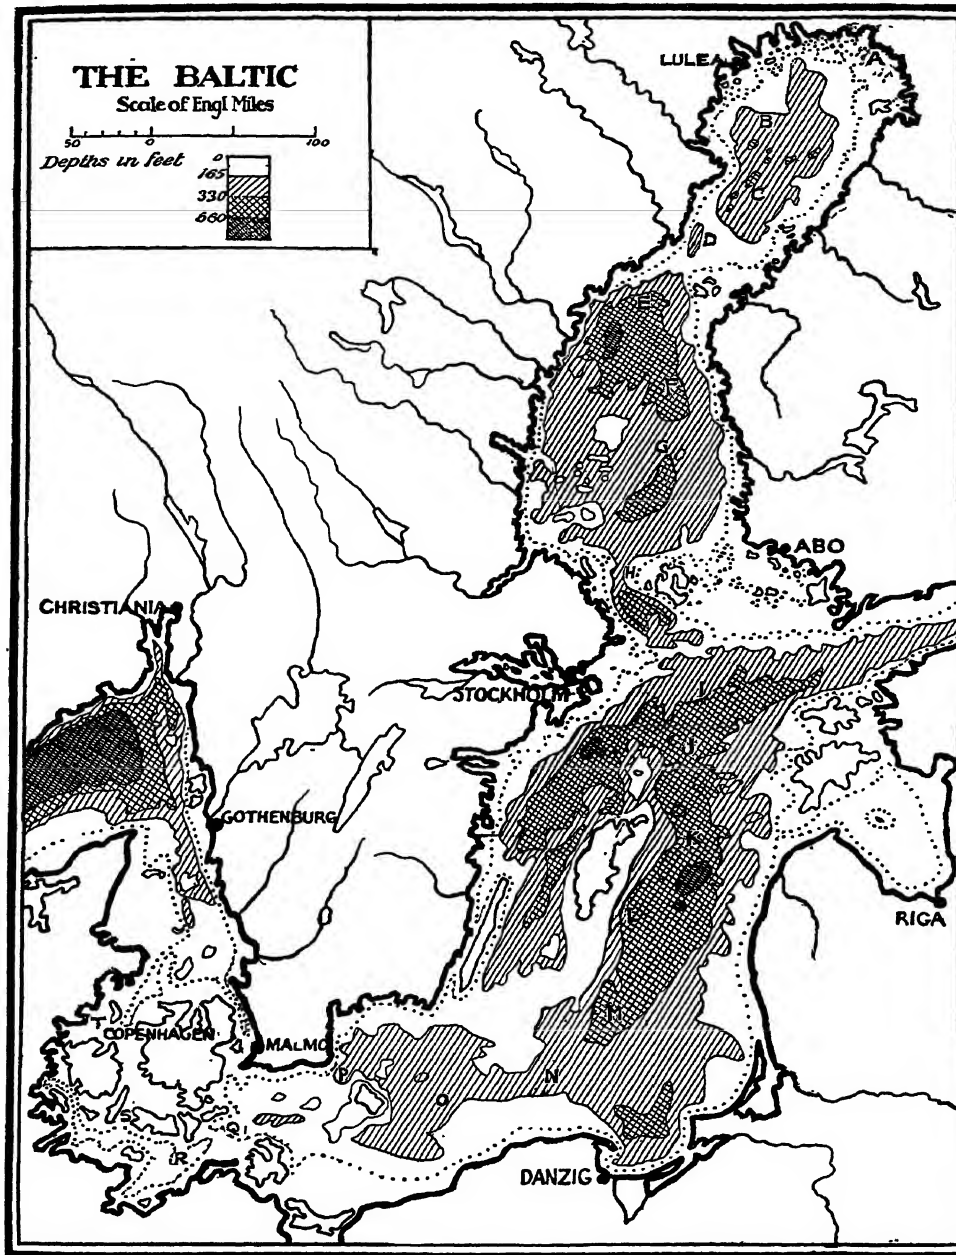

the island of Öland; this is entirely cut off to the south and east by a bank which sweeps eastward and northward from near Karlskrona, and on which the island of Gothland stands, but it communicates at its northern end with the Gothland deep, and near the junction opposite Landsort is the deepest hole in the Baltic (420 metres = 230 fathoms).

An unbroken ridge, extending from Stockholm to Hangö in Finland, separates the Baltic basin proper from the depression between Sweden and the Åland Isles, to which the name Åland Sea has been given. North of the Åland Sea a ridge defines the southern edge of another depression, the Bothnian Sea, which in turn is separated from the most northerly division, the Gulf of Bothnia, by a ridge across the narrow Quarken Strait. The Gothland deep may be said to extend directly into the Gulf of Finland, an arm of the Baltic, running eastwards for about 250 miles, and separating Finland from Esthonia. Between Esthonia and Courland is the Gulf of Riga, a shallow inlet of roughly circular form, about 100 miles in diameter, and nowhere more than 27 fathoms deep.

According to recent computations the total area of the Baltic, including the Skagerrak and Kattegat, is 430,970 sq. km. (= 166,397 sq. m.), and its volume 28,732 cub. km. (= 6907 cub. m.), giving a mean depth of 36 fathoms, which is markedly less than that of any other arm of the sea of similar area.

In the deeper hollows in the south part of the Baltic the bottom consists almost invariably of either soft brown or gray mud or hard clay, while on the shallow banks and near the low coasts fine sand—of white, yellow, or brown colour—with small pebbles, is usually found.

At the time of the last great subsidence, in glacial times, an arm of the sea extended across Sweden, submerging a great part of the littoral up to the Gulf of Bothnia, and including the present lakes Wener, Hjälmars, and Mälars. During this period the waters of the northern Baltic were sufficiently salt for oysters to flourish. The subsequent upheaval restricted direct communication with the open

MAP OF THE BALTIC SEA.

SECTION OF BALTIC ON LINE A TO T SHOWING SALINITY.

the "Middelbank" the "Danziger Tiefe," an isolated depression, lies to the south-east, while to the north-east the Gothland basin, the largest and deepest of all, extends north-eastwards to the Gulf of Finland. Along the Swedish coast a deep channel runs northward from outside

sea to the Danish channels, and the Baltic waters became fresher: the oyster disappeared, but a number of cold salt-water fishes and crustaceans, and even seals, became acclimatized. It has been suggested that the presence of the remains of these animals indicates a communication to the north with the Arctic Ocean; but in view of the severe climatic conditions

still prevailing at the time, this seems an unnecessary assumption. In the next stage of its history the Baltic is transformed by further elevation into a vast freshwater lake, the *Ancylus* lake of De Geer (named from the remains of the mollusc *Ancylus fluviatilis*), which is supposed to have covered an area of about 570,000 sq. km. (220,000 miles), including the whole of the present Baltic area and a large part of Finland, with Lake Ladoga. Then followed a subsidence, which not only re-established communication through the Danish channels, but allowed the Baltic to become sufficiently salt for such forms as *Cardium edule* and *Littorina littorea*. At this time the Gulf of Bothnia must have suffered greater depression than the Baltic proper, for the deposits of that epoch show a thickness of 100 metres (328 feet) near Hernösand, but of only 25 metres (82 feet) in the neighbourhood of Gothland. After this period of subsidence the process of elevation set in which gave the Baltic its present form and physical condition, and appears to be still in progress. Dr Sieger has traced a series of isobasic lines, or lines of equal rate of elevation, for portions of Sweden and Finland; these indicate that the movement is now almost nil along the axial lines of the Baltic and the Gulf of Finland, but increases in amplitude northwards to the Gulf of Bothnia and in the direction of the main ridge of the *massif* of southern Sweden. At Stockholm the rate of elevation is approximately 0.47 m. (=1.54 feet) in a century.

The drainage area of the Baltic is relatively large. According to the measurements of Murray it extends to 461,450 square sea miles (=611,700 square English miles). The largest river basin included in it is that of the Neva in the east, and next in size come the Vistula and the Oder in the south. The narrow parallel troughs, at right angles to the coast, which form the drainage system of Sweden and western Finland, are a remarkable feature.

The coast of the Baltic is rocky only in the island-studded region at the head of the Baltic basin proper—a submerged lake-district—and the littoral generally is a typical morainic land, the work of the last great Baltic glacier. The southern margin of the Baltic is of peculiar interest. From Schleswig eastwards to Lübeck Bay the coast is pierced by a number of narrow openings or *Fohrde*, the result of encroachment of the sea caused by subsidence. East of Lübeck, as far as the mouth of the Oder, these give place to *Bodden*, ramified openings studded with islands: the structure here resembles that of Scania in southern Sweden, a region once joined to both Denmark and Pomerania by an isthmus which was severed by tectonic movements. Beyond the Oder the coast-line is unbroken as far as the Gulf of Danzig. It is then cut into by the estuaries of the Vistula, the Pregel, and the Memel. Here the westerly winds have full play, and the coast is rimmed by a continuous line of dunes, which cut off the two great lagoons of the *Frisches Haff* and *Kurisches Haff* by sand-spits or *Nehrungen*.

Levellings from Swinemünde show that the mean level of the surface of the Baltic at that point is 0.093 metres (=305 feet) below the surface of the North Sea at Amsterdam, and 0.066 metres (=216 feet) below its level at Ostend. A line of levels from Swinemünde through Eger to the Adriatic showed the mean level of the surface of the Baltic to be 0.499 metres (1.6 feet) above that of the Adriatic Sea. The mean level of the surface of the Baltic rises about 0.5 metres (1.6 feet) from the coast of Holstein to Memel, probably as a result of the prevailing westerly winds; this mean difference is exceeded with strong westerly winds, and disappears or is reversed with easterly winds. The waves of the Baltic are usually short and irregular, often dangerous to navigation. Destructive waves, probably caused by distant earthquakes, called *Seebären* (cf. English "bores") have been recorded.

The range of the tides is about one foot at Copenhagen; within the Baltic proper ordinary tides are scarcely perceptible. There is, however, a distinctly marked annual rise and fall due to meteorological influences having a mean range of about 11.4 cm. (0.37 feet) at Travemünde, and 13.9 cm. (0.46 feet) at Swinemünde, the maximum occurring at the end of the summer rainy period in August.

The circulation of water in the Baltic proper must be considered apart from the circulation in the channels connecting it with the North Sea; and in this relation the ridge connecting the islands Falster and Møen with the coasts of Mecklenburg and Rügen must be taken as the dividing line. In the great basins and hollows from Rügen to the Gulfs of Bothnia and Finland the upper layers of water, from 30 to 70 metres (16 to 38 fathoms) in thickness, have almost the same salinity throughout. In these waters a vertical circulation is kept up by convection currents. Beneath these layers are masses of saltier water, through which a thermal wave of small amplitude is slowly propagated to the bottom by conduction. These strata are practically stagnant, deficient in oxygen, and surcharged with carbonic acid. Their saltier waters must have been originally derived from outside, and must therefore have passed over the ridge between Falster and Mecklenburg, but their horizontal extension is checked by the ridges separating the deep hollows in the Baltic from each other. The inflow to the

deep basins is intermittent, probably with a long period of flux and reflux.

The circulation in the channels connecting the Baltic proper with the North Sea is of a complex character. It is necessary in the first place to distinguish clearly between outflowing and inflowing waters, and in practice this is easily done, because the outflowing water always contains less than 30 *pro mille* of salt, and the inflowing water more than 32 *pro mille*. Since the Baltic receives much more water by rainfall, discharge of rivers, etc., than it loses by evaporation, a surplus must be got rid of by an outflowing current which may be named the "Baltic Stream." The following general laws may be laid down with regard to this:—

1. That the Baltic Stream must be a surface current, because it originates from a redundancy of fresh water.

2. That, on account of the earth's rotation, the main part of the Baltic Stream must keep close to the coast of the Scandinavian peninsula.

3. That it must be a periodic stream, because the discharge of the rivers into the Baltic varies with the season of the year. In spring and summer the water from the Baltic is sufficiently abundant to inundate the whole surface of the Kattegat and Skagerrak, but in winter the sources of the Baltic current are for the most part dried up by the freezing of the land water.

All the waters which enter the Skagerrak or Kattegat as undercurrents can be found at the surface of the North Sea (see NORTH SEA). They may be divided according to their origin and salinity as follows:—

- (a) *Ocean water* of 35 *pro mille* salinity or more.
- (b) *North Sea water*, the predominant water in the North Sea area, of 34 to 35 *pro mille* salinity.
- (c) *Bank water*, 32 to 34 *pro mille*, which forms a broad edging covering the coast banks of Holland, Germany, Denmark, and Norway.

The deepest water stratum in the Skagerrak is certainly of oceanic origin; it has been found to suffer changes of long period, and it is probably not always composed of water derived from the same part or the same depth of the North Atlantic; this water is, as a rule, deficient in oxygen. The "North Sea" water, of 34-35 *pro mille* salinity, does not appear at the surface in the Skagerrak, except as a strip along part of the coast of Jutland, but it is always found as an undercurrent overlying the oceanic water. It enters into all the deep coast channels, and into the Christiania fjord, but it is not always found in the deep channels of the Kattegat. The principal time of inflow of North Sea water is during spring and summer. The bank-water of 32 to 34 *pro mille* salinity is found all along the continental coast of the North Sea and North Atlantic, and it may therefore enter the Skagerrak either from the North Sea or from the north along the coast of Norway. It is probable indeed that an influx of this water occurs from both directions—in August and September from the south, and in the late winter and early spring from the north. The seasonal changes in the distribution of the bank-waters in different parts of the coast are too complex to be briefly explained; their relations to the times of occurrence of various fisheries of the region present many remarkable features, which have been investigated in recent years by the Swedish Commission.

On the west and south coasts of Sweden, and in the Skagerrak south-east of Norway, navigation is interfered with by ice only in severe winters, and then the ice is usually drifting, compact sea-ice being very rare. Between Stockholm and Wisby navigation usually ceases at the end of December and begins again about 10th April. During very severe winters the Åland Sea is covered with thick ice available for traffic. The south part of the Gulf of Bothnia is covered with ice every winter along the coasts, but rarely, if ever, in its central part. Navigation is interrupted by drifting ice from about the middle of November to the beginning of May, though the port of Hernösand has been known to remain open during a whole winter. The northern Quarken is covered with traversable ice every third or fourth year. The northern part of the Gulf of Bothnia is frozen every winter. In the Gulf of Finland the sea is closed to navigation by ice for about 150 days in the year; but navigation is now rendered possible throughout the winter by the use of ice-breakers.

Baltic and Black Sea Canal. See CANALS.

Baltimore, in Maryland, one of the chief cities

of the United States of America, situated on the north side of the Patapsco river, about 14 miles above its entrance into Chesapeake Bay, 38 miles N.E. of Washington, and 97 miles S.W. of Philadelphia. Its latitude is 39° 17' N. and longitude 76° 36' W. The harbour is defended by Fort M'Henry. (It was during the bombardment of this fort in 1814 that Francis Scott Key, a prisoner on one of the British ships, wrote "The Star-Spangled Banner.") The area of Baltimore was about doubled by an extension made in 1888. The region annexed extends to a line 2 miles north of the old northern boundary, and about 2 miles west of the old western boundary. The present area is about 32 square miles. Population (1880), 332,313; (1890), 434,439; (1900), 508,957. The death-rate in 1890 was 22.9, and in 1900, 21.0; of the whites (1900), 19.0, and of the coloured, 31.1. The coloured population was (1880) 53,716, (1900) 79,739 (79,258 negroes). Of the total population in 1900, 243,280 were males, 265,677 females, 440,357 native-born, 68,600 foreign-born. Out of 141,271 males 21 years of age and over, 10,152 were illiterate (unable to write), of whom 1261 were native whites, 2921 foreign whites, and 5785 negroes. Baltimore was among the earliest American cities to be provided with a general system of electric car-lines; and since 1890 there has been a rapid suburban growth, Roland Park to the north and Walbrook to the north-west being two of the principal new suburbs. In 1899 the total assessed valuation of real and personal property was \$388,242,020, the tax-rate \$21.58 per \$1000, and the net public debt \$32,928,106. The water-supply of Baltimore was very greatly increased in 1881 by the introduction of water from the Gunpowder River (in addition to the old supply from Jones Falls), the source of supply being at a point about 11 miles north of the city. The cost of the work, including the building of three new reservoirs, was about \$4,000,000. The entire water system of Baltimore is now capable of furnishing about 200,000,000 gallons daily. To the park system was added, in 1895, Clifton Park, acquired through the purchase from the trustees of the Johns Hopkins University of Clifton, the handsome estate of the late Johns Hopkins, comprising 252 acres. The parks are maintained from the proceeds of a tax of 9 per cent. on the gross receipts of the street railways (with certain exemptions as to the annexed district), which tax now amounts to nearly \$300,000 annually. The new court-house, completed in 1899, is a building of great beauty, chaste and dignified. In it all the courts (except the United States courts), the land records, the library of the Bar Association, &c., are accommodated. Opposite the court-house is the post-office, a large granite building, completed in 1890. Congress has also made provision for a handsome custom-house.

An event of the first importance in education, not only to Baltimore but to the whole United States, was the foundation of Johns Hopkins University, which opened its doors in 1876. Its endowment, under the will of Johns Hopkins, a Baltimore merchant and financier, who died in 1873, was valued at more than \$3,000,000. The devotion of the revenue thus placed in the hands of the trustees chiefly to the establishment of advanced university studies, somewhat on the plan of the German universities, constituted a new departure of the first importance in the history of higher education in America. (See *JOHNS HOPKINS UNIVERSITY*.) In 1888 was opened the Woman's College of Baltimore, an institution endowed and controlled by Methodists, but non-sectarian in its spirit. The Bryn Mawr School, founded by Miss Mary E. Garrett in 1885, and the Latin School of the Woman's College are important girls' schools preparatory to college. The

number of public schools is now 183, with 1802 teachers, an enrolment of about 65,000 pupils, and an annual expenditure of about \$1,400,000. In 1900 there were in the city 160,379 persons of school age (5 to 20 years inclusive). Baltimore has a number of medical schools, of which the most important are that of the Johns Hopkins University, that of the University of Maryland (founded in 1807), the College of Physicians and Surgeons, and the Baltimore Medical College. The chief law school is that of the University of Maryland. Among the dental schools is the Baltimore College of Dental Surgery, chartered in 1839, the oldest dental college in the world. The Maryland Institute maintains a very meritorious school of design, covering drawing, painting, and sculpture. The Peabody Institute carries on an important conservatory of music.

The Walters Art Gallery, although a private collection, is thrown open to the public during part of the year. Of the important foundations instituted in Baltimore, outside the field of education, the most noteworthy is the Johns Hopkins Hospital, for the endowment of which the founder bequeathed half his fortune. The principal (about \$3,000,000) of the fund has not been trencched upon, the buildings having been erected out of the income. The hospital was planned and constructed under the advisory supervision of Dr John S. Billings, of the United States Army Medical Corps. It provides clinical facilities for the medical school of the Johns Hopkins University, for the accommodation of which it also has extensive laboratories. The buildings are situated upon a tract of 12 acres, and are twenty in number; the beds numbered 320. It maintains a training school for nurses of the highest order. The Sheppard Asylum for the curative treatment of the insane was opened in 1890 upon the basis of a bequest made by Moses Sheppard in 1857. The endowment was more than doubled in 1898, through the bequest of Enoch Pratt, a Baltimore merchant and financier, the bequest being coupled with the condition that the name be changed to Sheppard and Enoch Pratt Hospital. It is now the most richly endowed hospital for mental diseases in the United States. Other notable institutions inaugurated within the past two or three decades are the M'Donogh School, the Samuel Ready Asylum for Female Orphans, and the Wilson Sanitarium for children. Baltimore was without a free circulating library until 1886, when the Enoch Pratt Free Library was opened. This institution has a central building and seven branches, and possesses about 200,000 volumes. Mr Pratt gave the buildings and the sum of \$833,333.33, upon condition that the city expended \$50,000 annually upon it.

The growth of manufactures in Baltimore has been rapid; the capital invested in manufacturing has risen from \$38,500,000 in 1880 to \$92,700,000 in 1890; the number of employees from 56,300 in 1880 to 83,700 in 1890; the annual amount of wages from \$15,000,000 in 1880 to \$36,000,000 in 1890. It is estimated that the amount of capital invested is now more than \$150,000,000. The Abbott Iron Works have been abandoned and the sugar-refining industry has ceased to exist; on the other hand, the steel works of the Maryland Steel Company have been established at Sparrow's Point, representing an investment of about \$8,000,000. The export trade has steadily increased. The total of exports for the fiscal year ending 30th June 1901 was \$106,239,081. During the preceding year the exports of breadstuffs amounted to \$37,997,080; sheep and cattle, \$5,139,864; copper, \$16,656,875; cotton, and its manufactures, \$8,360,193; provisions (meat and dairy products), \$20,304,582; and tobacco, \$6,797,534. The imports are much smaller, the

aggregate for the year ending 30th June 1901 being \$18,899,473.

The Baltimore and Ohio railway tunnel was completed in 1895. It is one mile and two-thirds in length, passes under the city from north to south, and is so equipped that trains can be run through it by electricity. Baltimore trust companies have taken a very active part in the financing of southern railway and other enterprises. It is estimated that the city has more than \$100,000,000 invested in the south. Connected with this financial business has been the growth of the bonding companies taking the place of individual bonds. Baltimore is probably the chief centre of this business for the United States. The bonding and trust companies of the city have an aggregate capital of \$21,650,000 and a surplus of \$17,502,000, or a total of capital and surplus of over \$39,000,000. The national banks of the city have an aggregate capital of \$11,758,260 and a surplus of \$4,479,275. Deposits in the savings banks amount to over \$50,000,000.

The political history of Baltimore in recent years has been peculiarly interesting. Shortly after the Civil War the Democratic party regained control of the city and organized a "machine" which for twenty-eight years held unshaken control of the government. The struggle to overthrow the machine began in earnest in 1875, when a coalition was made between the reform element in the Democratic party (under the able leadership of Severn Teackle

Wallis) and the Republican party. The attempt was renewed at frequent intervals, the chief obstacle encountered being the fraud and violence in elections, until it culminated in the victory of 1895. A new election law of the most thoroughgoing kind was then enacted by the legislature, under which the old evils have been completely removed. The Republican mayor elected in 1895, in his desire to govern the city properly, encountered strong opposition from the city council, which passed an ordinance taking away from the mayor the power of appointment and vesting it in themselves, and carried it by a three-fourths vote over the mayor's veto. Upon a test case, the Maryland Court of Appeals decided that the council had exceeded its powers. The affair led to the passing of a new charter, some of the salient features of which are as follows:—Doubling of the terms of mayor and city councillors; appointment by the mayor of the heads of executive departments, and of subordinate officials by these heads; mayor's appointments subject to confirmation by the second branch of the city council only; this branch made a small body of eight men, each chosen from the whole of a section, including one-fourth of the city; the president of the second branch elected by the city as a whole; a board of estimates and a board of public improvements, each made up of heads of the appropriate executive departments (together with the president of the second branch), exercising supervision and control of appropriations, &c., and a school board consisting of nine persons appointed from the city at large by the mayor. The new school board replaced a board of twenty-two members, one from each ward, who were nominally elected by the first branch of the city council, but were practically chosen for political reasons, each by the councillor from his ward, and were, as a rule, obviously unfit for school management. The characteristic features of the events here sketched have been the effectiveness of the reform movement and the recognition of the power of the independent element. (F. FR.)

BALUCHISTAN.

BALUCHISTAN, a country which, like Afghanistan, derives its name from the dominant race of its inhabitants, extends from the Gomul (or Gumal) river to the Arabian Sea, and from the borders of Persia and Afghanistan to those of the Punjab and Sind. Three hundred miles of its mountain walls facing the Indus are south of the railway from the Indus to Quetta, and about 250 north of it. The railway with the passes and plains about it, and the dominant hills which surround Quetta, divide Baluchistan into two distinct parts. North of the railway line, hedged in between Afghanistan and the plains of the Indus, stretch the long ridges of rough but picturesque highlands, which embrace the central ranges of the Sulimani system (the prehistoric home of the Pathan highlander), where vegetation is often Alpine, and the climate clear and bracing and subject to no great extremes of temperature. The average breadth of this northern Pathan district is 150 miles, but it narrows to less than 100 miles on the line of the Gomul, and expands to more than 200 miles on the line of the railway. Here all the main drainage runs either northwards to the Gomul, passing through the uplands that lie west of the Sulimani range; or it gathers locally in narrow lateral valleys at the back of these mountains, and then bursts directly eastwards through the limestone axis of the hills, making for the Indus by the shortest transverse route. South of the railway lies a square block of territory, measuring roughly 300 miles by 300, primarily the home of the Brahui and the Baluch; but within that block are included almost every conceivable phase of climate and representatives of half the great races of Asia. Here, throughout the elevated highlands of the Kalat plateau which are called Jalawan, the drainage gathers into channels which cut deep gorges in the hills, and passes eastwards into the plains of Sind. Beyond and south of the hydrographical area of the Jalawan highlands the rivers and streams of the hills either run in long straight lines to the Arabian Sea, north of Karachi, or, curving gradually westwards, they disappear in the inland swamps which form so prominent a feature in this part of South-West Asia. A narrow width of the coast districts

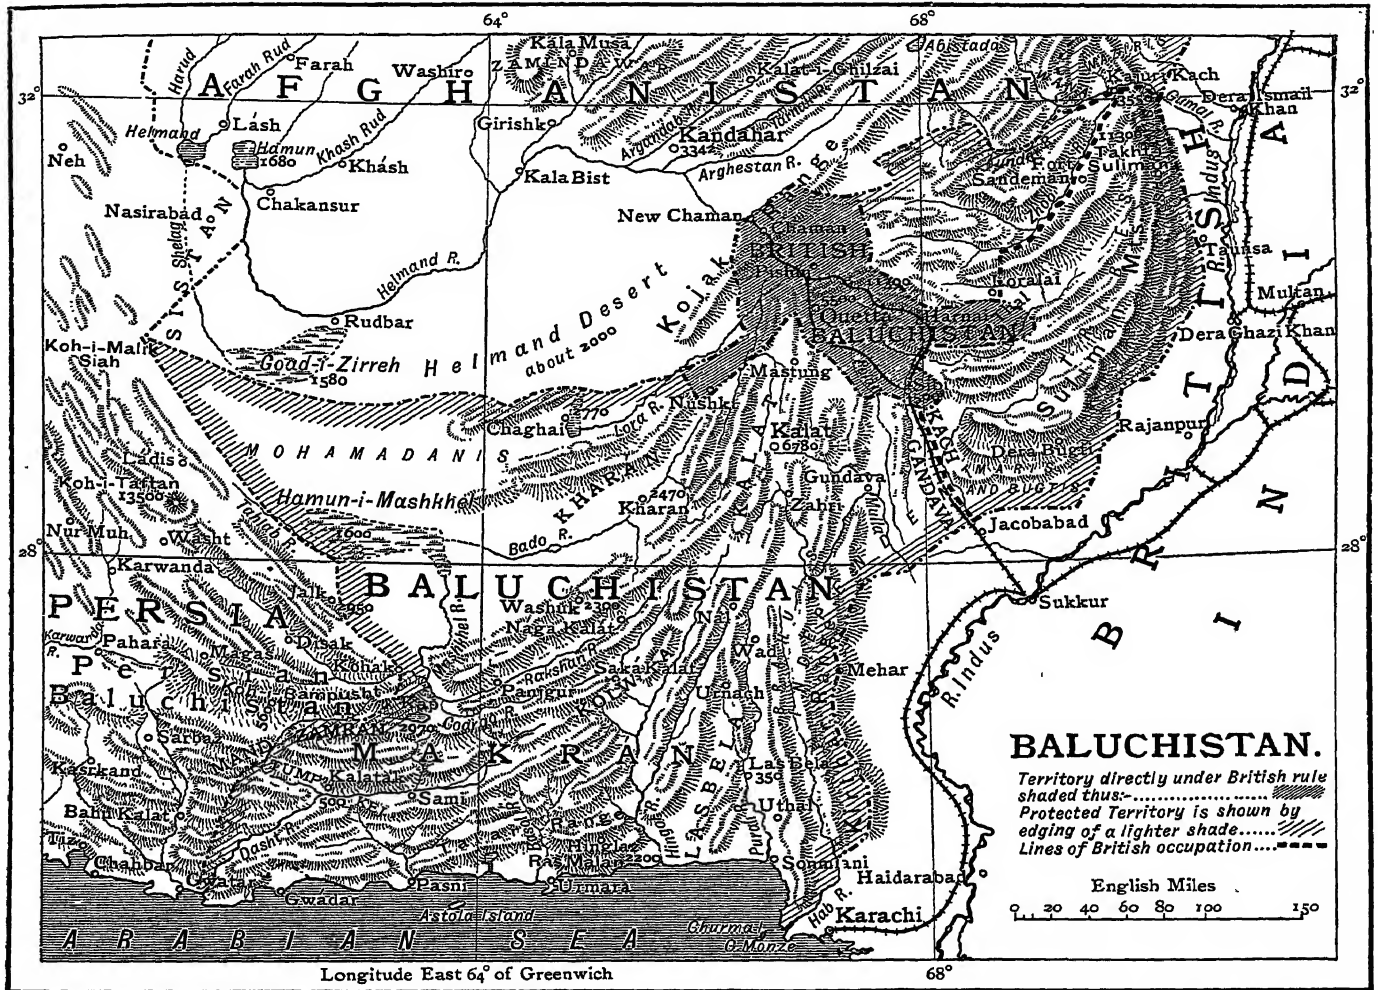

collects its waters for discharge into the Arabian Sea direct. This section includes Makran. Baluchistan thus becomes naturally divided into two districts, north and south, by an intervening space which contains the Sind-Pishin railway. This intervening space comprises the wedge-shaped desert of Gandava (Kach Gandava), which is thrust westwards from the Indus as a deep indentation into the mountains, and, above it, the central uplands which figure on the map as "British Baluchistan"—where lies Quetta. All Baluchistan has now been surveyed. From the great Indus series of triangles bases have been selected at intervals which have supported minor chains of triangulation reaching into the heart of the country. These again have been connected by links of more or less regularity, so that, if the Baluchistan triangulation lacks the rigid accuracy of a "first-class" system, it at least supports good topography on geographical scales.

From Domandi, at the junction of the Gomul and Kundar rivers, the boundary between Baluchistan and Afghanistan follows the Kundar stream for about 40 miles to the south-west. It then leaves the river and diverges northwards, so as to include a section of the plain country stretching away towards Lake Abistada, before returning to the skirts of the hills. After about 100 miles of this divergence it strikes the Kadanai river, turning the northern spurs of the Toba plateau (the base of the Kojak range), and winds through the open plains west of the Kojak. Here, however, the boundary does not follow the river. It deserts it for the western edge of the Toba plateau (8000 feet high at this point), till it nears the little railway station of New Chaman. It then descends to the plains, returns again to the hills 40 miles south of Chaman, and thenceforward is defined by hill ranges southwards to Nushki. The eastern boundary of this northern section of Baluchistan is the "red line" at the foot of the frontier hills, which defines the border of British India. This part of Baluchistan thus presents a buffer system of independent tribes between the British frontier and Afghanistan. But the independence of the Pathan people south of the Gomul is not as the independence of the Pathans (Waziris, Afridis, &c.) who live north of it. It is true that the Indian Government interferes as little with the internal jurisdiction of the tribal chiefs amongst the Pathans of the Sulimani range as it does with that of the northern chiefs; but the occupation of a line of posts on the Zhob river, which flanks that range almost from end to end on the west, places the doors of communication with Afghanistan in British hands, and gives command of their hills. It thus tends to the maintenance of peace

and order on the southern frontier to a degree that does not exist in the north.

The central range of the Sulimanis is the dominant feature in the geography of Northern Baluchistan. The central line or axis of the range lies a little east of the meridian of 70° E., and it is geologically composed of one or more great folds of the Cretaceous series. Towards the northern extremity of the range occur a group of peaks, which together form an oblong block or "massif" amongst the neighbouring ridges known as "Kaisargarh" amongst the Sherani clansmen who occupy it, and as the "Takht-i-Suliman" (Solomon's throne), generally, on the frontier, from the fact of a celebrated shrine of that name existing near its southern

abutment. The massif of the Takht is a high tableland (about 8000 feet above sea-level), bounded on its eastern and western edges by high, rugged, and steep parallel ridges. The western ridge culminates on the north in the peak of Kaisargarh (11,300 feet), and the eastern in a block, or detached headland, on the south, where rests the immortal "ziarat" or shrine (11,070 feet). This tableland is formed by a huge cap of coral limestone, estimated by Griesbach at from 4000 to 5000 feet in thickness. At each end the tableland is rent by gorges which deepen, amidst stupendous precipices, to the channel of the Draband or "Gat" on the north, and of the Dhana on the south. These two channels carry the rush of mountain streams from the western slopes of the massif right

MAP OF BALUCHISTAN.

Walker & Cockerell sc.

across the axis of the mountains and through the intervening barrier of minor ridges to the plains of the Indus. The plateau is covered with a fairly thick growth of the chilghosa or "edible" pine, and a sprinkling of juniper, on the higher slopes. It was ascended and surveyed for the first time in 1883.

From the summit of the Kaisargarh peak a magnificent view is obtained which practically embraces the whole width of Northern Baluchistan. Westwards, looking towards Afghanistan, line upon line of broken jagged ridges and ranges, folds in the Cretaceous series overlaid by coarse sandstones and shales, follow each other in order, preserving their approximate parallelism until they touch the borders of Baluchistan. Immediately on the west of the Kaisargarh there towers the Shingarh mountain, a geological repetition of the Kaisargarh ridge, black with pines towards the summit, and crowned with crags of coral limestone. Beyond it are the gray outlines of the close-packed ridges which enclose the lower reaches of the Zhob and the Kundar. As they pass away southwards this gridiron formation strikes with a gentle curve westwards, the narrow enclosed valleys widening out towards the sources of the rivers, where ages of denudation have worn down the folds and filled up the hollows with fruitful soil, until at last they touch the central water-divide, the key of the whole system, on the Quetta plateau. Thus the upper parts of the Zhob valley are

comparatively open and fertile, with flourishing villages, and a cultivation which has been greatly developed under British rule, and are bounded by long sweeping gentle spurs clothed with wild olive woods containing trees of immense size. The lower reaches of the Zhob and Kundar are hemmed in by rugged limestone walls, serrated and banded with deep clefts and gorges, a wilderness of stony desolation. Looking eastwards from the Kaisargarh, one can again count the backs of innumerable minor ridges, smaller wrinkles or folds formed during a process of upheaval of the Sulimani mountains, at the close of a great volcanic epoch which has hardly yet ceased to give evidence of its existence. On the outside edge, facing the Indus plains, is a more strictly regular, but higher and more rugged, ridge of hills which marks the Siwaliks. The Baluch Siwaliks afford us strange glimpses into a recent geological past, when the same gigantic mammals roamed along the foot of these wild hills as once inhabited the tangled forests below the Himalaya. Between the Takht mountain and the Siwaliks, the intervening belt of ridge and furrow has been greatly denuded by transverse drainage—a system of drainage which we now know to have existed before the formation of the hills, and to have continued to cut through them as they gradually rose above the plain level. Where this intervening band is not covered by recent gravel deposits, it exhibits beds of limestone,

clays, and sandstone with fossils, which, in age, range from the Lower Eocene to the Miocene. Beyond the Siwaliks, still looking eastwards, are the sand waves of the Indus plain; a yellow sea broken here and there with the shadow of village orchards and the sheen of cultivation, till it rests against the long black sinuous line which denotes the fringe of trees bordering the Indus. Such is the scene which Solomon is said to have invited his Indian bride to gaze upon for the last time, as they rested on the crags of the southern buttress of the Takht—where his shrine exists to this day. To that shrine thousands of pilgrims, Mahomedans and Hindus alike, resort on their yearly pilgrimages, in spite of its dangerous approach. All this country, so far, is independent Baluchistan within the jurisdiction of the Baluchistan Agency, with the exception of certain clans of the Sheranis on the eastern slopes of the Takht-i-Suliman, north of the Vihova, who are under Punjab administration.¹ Wedged in between the railway and the Indus, but still north of the railway, is a curious mass of rough mountain country, which forms the southern abutment of the Sulimani system. The strike of the main ridges forming that system is almost due north and south till it touches 30° N. lat. Here it assumes a westerly curve, till it points north-west, and finally merges into the broad band of mountains which hedge in the Quetta and Pishin uplands on the north and east.

At this point, as might be expected, are some of the grandest peaks and precipices in Baluchistan. Khalifat on the east of Quetta, flanking the Harnai loop of the Sind-Pishin railway; Takatu to the north; Chahiltan on the south-west; and the great square-headed Murdar to the south—all overlook the pretty cantonment from heights which range from 10,500 to 11,500 feet. Lying in the midst of them, on an open plain formed by the high-level tributaries of the Lora (which have also raised the Pishin valley to the north), 5500 feet above the sea, is Quetta. Quetta was founded in 1873, and has now grown into one of the most popular, as it is one of the most picturesque, of Indian military stations. The mass of twisted flexures, the curved wrinkles that end the Sulimani system, is occupied by true Baluchis, the Mari and Bugti sections of the great Rind confederation of tribes owning an Arabic origin. There are no Pathans here. To the north of them are the Boddars, another Rind clan; and these Rind tribes form the exception to the general rule of Pathan occupation of Northern Baluchistan. Amongst the Pathans, the Kakurs and Dumurs of Pishin, with the Mando Khel of Zhob, are the most prominent tribal divisions.

The curved recession of the Sulimani ranges to the north-west leaves a space of flat alluvial desert to the south, which forms a sort

Central. of inlet or bay striking into the Baluchistan mountain system. The point of this desert inlet receives the drainage of two local basins, the Bolan and the Nari. Both drain south-eastwards from the central Quetta-Pishin plateau, and both have served for railway alignment. Being fed by tributaries which for the most part drain narrow valleys where gradual denudation has washed bare the flat-backed slopes of limestone ridges, and which consequently send down torrents of rapidly accumulating rainfall, both these central lines of water-course are liable to terrific floods. The drainage of the Bolan and Nari finally disappears in the irrigated flats of the alluvial bay (Kach Gandava), which extends 130 miles from the Indus to Sibi at the foot of the hills, and which offers (in spite of periodic Indus floods) an opportunity for railway approach to Baluchistan such as occurs nowhere else on the frontier. Kach Gandava, whilst its agricultural development has in no way receded, is now rivalled by many of the valleys of the highlands. Its climate debars it from European occupation. It is a land of dust-storms and poisonous winds; a land where the thermometer never sinks below 100° F. in summer, and drops below freezing-point in winter; where there is a deadly monotony of dust-coloured scenery for the greater part of the year, with the minimum of rain and the maximum of heat. The Quetta and Pishin plateau to which it leads is the central dominant water-divide of Baluchistan and the base of the Kandahar highway.

An irregularly-shaped block of upland territory, which includes all the upper Lora tributaries, and the Toba plateau beyond them; resting on the Kojak range (with an advanced loop to include the Chaman railway terminus) on the west; reaching south through Shorarud to Nushki; including the basins of the Bolan and Nari as far as Sibi to the south-east; stretching out an arm to embrace the Tal Chotali valley on the east, and following the main water-divide between the Zhob and Lora on the north, is called British Baluchistan. It is leased from Kalat, and forms a distinctive province, being brought under the ordinary forms of civil administration in British India. Beyond it, north and south, lies independent Baluchistan, but this independence is not that of Afghanistan—hardly that of the native states of the Indian peninsula. Instead of being subject to civil administration, independent Baluchistan is under political control; and its administrative staff is more distinctly military than that of the assigned districts of

British Baluchistan. The degree of independence enjoyed by the various districts of Baluchistan may be said to vary in direct proportion to their distance from Quetta. No part of Baluchistan is beyond the reach of the political officer, but there are many parts where he is not often seen. The governor-general's agent at Quetta is invested with supreme authority. The climate of British Baluchistan is dry and bracing—even exhilarating—but the extremes of temperature lead to the development of fever in very severe forms. On the whole it is favourable to European existence.

South-west of the dividing railway lies the great block of Southern Baluchistan. Within this area the drainage generally trends south and west, either to the Arabian Sea, or to the central **Southern.** swamps of Lora and Mashkel. The Hab river, which forms the boundary west of Karachi; the Puráli (the ancient *Arabia*), which drains the low-lying flats of Las Bela; the Hingol (the ancient *Tomeros*) and the Dasht, which drain Makrán, are all considerable streams, draining into the Arabian Sea, and forming important arteries in the network of internal communication. An exception to the general rule is found in the Mulla, which carries the floods of the Kalat highlands into the Gandava basin, and which forms one of the most important of the ancient highways from the Indus plains to Kandahar. The fortress of Kalat is situated about midway between the sources of the Bolan and the Mulla, near a small tributary of the Lora (the river of Pishin and Quetta), about 6800 feet above sea-level, on the western edge of a cultivated plain in the very midst of hills. (See KALAT.) To the north are the long sweeping lines of the Sarawán ridges, enclosing narrow fertile valleys, and passing away to the south-west to the edge of the Kharán desert. East and south are the rugged bands of Jalawán, amongst which the Mulla rises, and through which it breaks in a series of magnificent defiles in order to reach the Gandava plain. Routes which converge on Kalat from the south pass for the most part through narrow wooded valleys, enclosed between steep ridges of denuded hills, and, following the general strike of these ridges, they run from valley to valley with easy grades. Kalat is the "hub" or centre, from which radiate the Bolan, the Mulla, and the southern Lora affluents; but the Lora drains also the Pishin valley on the north; the two systems uniting in Shorawak, to lose themselves in the desert and swamps to the west of Nushki, on the road to Sistán. Sixty miles south of Kalat, and beyond the Mulla sources, commences another remarkable hydrographic system which includes all Southern and South-Western Baluchistan. To the west lies the Kharán desert, with intermittent river channels enclosed and often lost in sand-waves ere they reach the Mashkel swamps on the far borders of Persia. To the south-west are the long sweeping valleys of Rakshán and Panjgur, which, curving northwards, likewise discharge their drainage into the Mashkel. Directly south are the beginnings of the meridional arteries, the Hab, the Puráli, and the Hingol, which end in the Arabian Sea, leaving a space of mountainous seaboard (Makrán) south of the Panjgur and west of the Hingol, which is watered (so far as it is watered at all) by the long lateral Kej stream and several smaller mountain nullahs. Thus Southern Baluchistan comprises four hydrographical sections. First is the long extension from Kalat, southwards, of that inconceivably wild highland country which faces the desert of Sind, the foot of which forms the Indian frontier. This is the land of the Brahui, and the flat wall of its frontier limestone barrier is one of the most remarkable features in the configuration of the whole line of Indian borderland. For the first 60 miles from the sea near Karachi the Hab river is the boundary of Sind, and here, across the enclosing desolation of outcropping ridges and intervening sand, a road may be found into Makrán. But from the point where the boundary leaves the Hab to follow the Kirthar range not a break occurs (save one) in 150 miles of solid rock wall, rising many thousands of feet straight from the sandy plain. The one break, or gorge, which allows the Kej waters to pass only forms a local gateway into a mass of impracticable hills. Secondly, to the west of this mountain wilderness, stretching upwards from the sea in a wedge form between the Brahui highlands and the group of towering peaks which enclose the Hingol river and abut on the sea at Malán, are the alluvial flats and delta of the Puráli, forming the little province of Las Bela, the home of the Las Rajput. In this hot and thirsty corner of Baluchistan, ruled by the Jam or Cham, there is a fairly wide stretch of cultivation, nourished by the alluvial detritus of the Puráli, and well irrigated. In a little garden to the south of the modern town of Las Bela (the ancient *Armabel*) is the tomb of Sir Robert Sandeman, who spent the best part of an energetic and active life in the making of Baluchistan.

Westward of the Hingol, and fringing the Arabian Sea, stretching into the Persian frontier (here defined by the Dasht river), is the maritime province of Makrán, the home of many mixed races, amongst which the Arab Rind predominates. **Makrán.** The long lateral valley of Kej is usually associated with Makrán in early geographical records. The Kej-Macorán of Marco Polo is the Makrán of to-day. Behind a stretch of sandy foreshore, which is broken on the coast-line by the magnificent cliffs of Malán, the

¹ Now included within the limits of the lately formed frontier province.

hammer-shaped headlands of Urmara and Gwadar, and the precipitous cliffs of Jebel Zarain, near Pasni, lies the usual frontier band of parallel ridges, alternating with narrow furrows or valleys. Amongst them the ranges called Talāna and Talur are conspicuous by their height and regular configuration. The normal conformation of the frontier is somewhat emphasized in Makrán. Here the volcanic action which preceded the general upheaval of recent strata and the folding of the edges of the interior highlands, is still in evidence in occasional boiling-mud volcanoes on the coast-line. It is repeated in the blazing summit of the Koh-i-taftán (the burning mountain of the Persian frontier), which is the highest active volcano in Asia (13,000 feet), and probably the farthest inland. Evidence of extinct mud volcanoes exists through a very wide area in Baluchistan and Sistan. Probably the Miri, or fort, at Quetta represents one of them. The coast is indented by several considerable harbours. Urmara, Khor Khalmat, Pasni, and Gwadar are all somewhat difficult of approach by reason of a sand-bar which seems to extend along the whole coast-line, and which is very possibly the last evidence of a submerged ridge; and they are all subject to a very lively surf under certain conditions of wind. Of these the port of Gwadar (which belongs to Muscat and is therefore foreign territory) is the most important. They all are (or were) stations of the Indo-Persian telegraph system which unites Karachi with Bushire. With the exception of the Kej valley, and that of the Bolida, which is an affluent of the Kej, there are no considerable spaces of cultivation in Makrán. These two valleys seem to concentrate the whole agricultural wealth of the country. They are picturesque, with thick groves of date palms at intervals, and are filled with crops and orchards. They are indeed exceedingly beautiful; and yet the surrounding waste of hills is chiefly a barren repetition of sun-cracked crags and ridges with parched and withered valleys intersecting them, where a trickle of salt water leaves a white and leprous streak amongst the faded tamarisk or the yellow stalks of last season's grass. Makrán is the home of remnants of an innumerable company of mixed people gathered from the four corners of Asia and Eastern Africa. The ancient Dravidians, of whom the Brahui is typical, still exist in many of the districts which are assigned to them in the works of Herodotus. Amongst them there is always a prominent Arab element, for the Arabs held Makrán even before they conquered Sind and made the Kej valley their trade highway to India. There are negroes on the coast, bred from imported slaves. The Meds of the Indus valley still form the greater part of the fishing population, representing the Ichthyophagi of Arrian's history. The old Tajak element of Persia is not so evident in Makrán as it is farther north; and the Karak pirates, who gave their name to Karachi, and whose depredations led to the invasion of India and the conquest of Sind, seem to have disappeared altogether. The fourth section includes the valleys formed by the Rakshán and Mashkel, which, sweeping downwards from the Kalat highlands and the Persian border east and west, unite to break through the intervening chain of hills northward to form the Mashkel swamps, and define the northern limits of Makrán. In these valleys are narrow strips of very advanced cultivation, the dates of Panjgur being famous and generally reckoned superior even to those of the Euphrates. The great Mashkel swamp, and the Kharán desert to the east of it, mark the flat phase of Southern Baluchistan topography. It is geologically part of an ancient inland lake or sea which included the present swamp regions of the Helmund, but not the central depression of the Lora. The latter is buttressed against hills at a much higher elevation than the Kharán desert, which is separated from the great expanse of the Helmund desert within the borders of Afghanistan by a transverse band of serrated hills forming a distinct watershed from Nushki to Sistán. Here and there these jagged peaks appear as if half overwhelmed by an advancing sea of sand. They are treeless and barren, and water is but rarely found under the edges of their foot-hills. The Koh-i-Sultan, at the western extremity of the northern group of these irregular hills, is over 6000 feet above sea-level, but the general level of the surrounding deserts is only about 2000 feet, sinking to 1500 feet in the Mashkel Hamun and the Gaod-i-Zirreh.

The boundary between Baluchistan and Afghanistan, starting from Nushki, cuts across the Lora Hamun, leaving the frontier post of Chagai to Baluchistan, and from this point to the Malik Siyah Koh it is based partly on the central mountainous water-divide already referred to, and partly runs in straight lines through the desert south of the salt swamps of the Gaod-i-Zirreh. It thus passes 50 miles to the south of the Helmund, entirely shutting off that valley, and the approach to Sistán between the Helmund and the Gaod-i-Zirreh (the only approach from the east in seasons of flood) from Baluchistan. But it leaves a connected line of desert route between Nushki and Sistán, which is open in all ordinary seasons, to the south, and this route has been largely developed, posts or serais having been established at intervals, and wells having been dug. There is already a promising Khafila traffic along it. Within the Baluchistan half of the desert are to be found scattered tribes of nomads, called

Rekis (or desert people), of which the Mohamadani are the most numerous. They are probably of Arab origin. This central desert is the Kir, Kej, Katz, or Kash Kaian of Arabic mediæval geography and a part of the ancient Kaiani kingdom; the prefix Kej or Kach always denoting low-level flats or valleys, in contradistinction to mountains or hills. The Mohamadani nomads occupy the central mountain region, to the south of which lie the Mashkel and Kharán deserts, inhabited by a people of quite different origin, who possess something approaching to historical records. These are the Naoshirwanis, a purely Persian race, who passed into Baluchistan within historic times, although the exact date is uncertain. The Naoshirwanis appear to be identical with the Tabuki or Tahukáni, who are to be found in Perso-Baluchistan. Tabuki is mentioned by Nearchos, by Strabo, and by Ptolemy. They are a fine manly race of people, in many respects superior to their modern compatriots of Iran. If left to themselves it is probable that the Naoshirwanis would displace the Brahuis as the dominant race in Baluchistan. Between the Naoshirwanis of the Kharán desert and Mashkel, and the fish-eating population of the coast, enclosed in the narrow valleys of the Rakshán and Kej tributaries, or about the sources of the Hingol, are tribes innumerable, remnants of races which may be recognized in the works of Herodotus, or may be traced in the records of recent immigration. Equally scattered through the whole country, and almost everywhere recognizable, is the underlying Persian population (Tajak), which is sometimes represented by a locally dominant tribe, but more frequently by the agricultural slave and bondsman of the general community. Such are the Dehwars or Dehkans, and the Durzadas (*Derusæ* of Herodotus), who extend all through Makrán, and, as slaves, are called Nakibs. The Arabs have naturally left their mark most strongly impressed on the ethnography of Baluchistan. All Rind tribes claim to be of Arab origin and of Khoreish extraction. As the Arabs occupied all Southern Baluchistan and Sistán from a very early date, and finally spread through the Sind valley, where they remained till the 12th century, their genealogical records have become much obscured, and it is probable that there is not now a pure Arab in the country. It is as builders or engineers that they have established their most permanent records, Makrán being full of the relics of their irrigation works constructed in times when the climatic conditions of Baluchistan must have been very different from what they are now. Lower Sind also contains a great wealth of architectural remains, which may be found to the west of the Indus as well as in the delta. One particular tribe (the Kalmats), who left their name on the Makrán coast and subsequently dominated Bela and Sind, west of the Indus, for a considerable period, exhibit great power of artistic design in their sepulchral monuments. The Dravidian races (Brahuis), who are chiefly represented by the Kambaranis and Mingals, or Mongals (the latter are doubtless of Tartar origin), spread through Southern Baluchistan as well as the eastern hills, and are scattered irregularly through the mountain tracts south of Kharán. The ancient Oriete mentioned by Arrian are probably represented by the tribe of Hot, who, as original masters of the soil, are exempt from taxation. The name Brahui is (according to Bellew) but a corruption of Ba-rohi, (or "hillmen") in a language derived from Sanskrit which would represent the same term by Parva-ka. So that the "Parkana" of Arrian may be recognized as surviving in the Brahui, and in the name (Parkán) of a mountain-bred stream which is a tributary of the Hingol. Amongst other aboriginal tribes to whom reference is made by very early writers are the Bolédi, who give their name to the Bolida valley, a tributary of the Kej. The Bolédi were once the ruling race of Southern Baluchistan, which was originally called Boledistan, and it seems possible that this may be the real origin of the much-disputed name of the country generally. Bola was an Assyrian term for Bael or Bel, the god of the Phœnicians and Druids. The Bolédi ruling family are at present represented by but one living member, a lady, who is a Government pensioner. The fast-diminishing Sajidis (Sajittæ) and Saka (Sacæ) are others of the more ancient races of Baluchistan easily recognizable in classical geography. Most recent of all are the Gichkis. The Gichkis derive from a Rajput adventurer who flourished in the early part of the 17th century. They are now the dominant race in Panjgur and Kej, from whence they ousted the Boledis. For three generations they remained Hindus; since then there has arisen amongst them a strange new sect called Zikari, with exceedingly loose notions of morality. The sect, however, appears to be fast merging into orthodox Mahomedanism. A Baluch (or rather Makrán) race which deserves attention is that of the Gadaras, who once gave the name Gadosia to Southern Baluchistan. According to Tate, the Gadaras are now represented by Sidi half-castes—those Makráni "boys" who are so well known in the mercantile marine as stokers and firemen. It seems unlikely that this modern admixture of Asiatic and African blood represents the "Asiatic Ethiopian" of Herodotus, which was more probably a direct connexion of the Himyaritic Arab builders of "bunds" and revetments who spread eastwards from Arabia (see ARABIA). Bellew finds in the Gadara the Garuda (eagles) of Sanskrit, who were ever in opposition to the

Naga (snakes) of Scythic origin. Southern Baluchistan affords a most interesting field for the ethnographer. It has never yet been thoroughly explored in the interests of ethnographical science.

The Baluch character is influenced by its environment as much as by its origin, so that it is impossible to select any one section of the general community as affording a satisfactory sample of popular Baluch idiosyncrasies. The Rind, or Baluch Arab, is perhaps the dominant type, and as he is least affected by foreign influence he is usually selected as the representative Baluch. The Baluchis of Arab extraction exhibit their Semitic origin strongly in their features, and possess much of the courage and chivalry of the original stock. They are a manly, hardy, and physically well-developed race, following no priestly leading, and not given to fanaticism, but banded together in a sort of feudal confederation under their tribal chiefs, who are their leaders in council as they are in war. Their courage and their loyalty to their chiefs are noble characteristics; and they are characteristics which render them far more amenable to British control than is the republican Pathán. In war it leads them to attack in the open, and in council it places the conduct of negotiations in the hands of but a recognized few.

The strategical position of Great Britain in Baluchistan is a very important factor in the problem of maintaining order and good administration in the country. The ever-restless Pathan tribes of the Sulimani are held in check by the occupation of the Zhob valley; whilst the central dominant position at Quetta safeguards the peace and security of Kalat, and of the wildest of the Baluch hills occupied by the Maris and Bugtis, no less than it bars the way to an advance upon India by way of Kandahar. Nominally all the provinces and districts of Baluchistan, with the exception of the ceded territory which we call British Baluchistan, are under the Khan of Kalat, and all chiefs acknowledge him as their suzerain. But it may be doubted if this suzerainty was ever complete, or could be maintained at all but for the assistance of the British Government. The Baluch is still essentially a robber and a raider (a trait which is common to all tribes), and the history of Baluchistan is nothing but a story of successful robberies, of lawless rapine and bloodshed for which plunder and devastation were accounted a worthy and honourable return.

Extensive changes have taken place in the climatic condition of the country—changes which are some of them so recent as to be noted by surveyors who have found the remains of forests in districts now entirely desiccated. Possibly the ordinary processes of denudation and erosion, acting on those recent deposits which overlie the harder beds of the older series, may have much to say to these climatic changes, and the wanton destruction of forests may have assisted the efforts of nature; but it is difficult to understand the widespread desiccation of large areas of the Baluch highlands, where evidences of Arab irrigation works and of cultivation still attest to a once flourishing agricultural condition, without appealing to more rapidly destructive principles for the change. There is ample proof throughout the country of alterations of level within recent geologic periods; and there have even been compressions, resulting in a relative rise of the ground, over the crests of anticlinal folds, within historic record. "Proof that this compression is still going on was given on 20th December 1892, when a severe earthquake resulted from the sudden yielding of the earth's crust along what appears to be an old line of fault, west of the Khojak range, whereby an adjustment took place indicated by a shortening of some 2½ feet on the railway line which crossed the fault."¹ Nor should the evidences of active volcanic agency afforded by the mud volcanoes of the coast be overlooked. It is probably to climatic changes (whatever their origin may have been), rather than to the effects of tribal disturbances, that the Arab's disappearance from the field of trade and agriculture must be attributed.

Law and order, and with them prosperity, were revived for a short space by the treaty of 1854 between the Khan of Kalat and the British Government, but with the breaking of that treaty came a renewal of the old state of confusion to which it was intended to put an end. The chiefs of Las and Wad, the Maris and Bugtis, Kej and Makrán, all threw off their allegiance, and anarchy became so widespread that the British Government again interfered. The treaty of 1854 was renewed in 1876 by Lord Lytton (under Sandeman's advice), and the Khan received substantial aid from the Government in the form of an annual subsidy of a lakh of rupees, instead of the 50,000 previously assigned to him. The treaty of 1854 was a treaty of alliance offensive and defensive. The treaty of 1876 renewed these terms, but utterly changed the policy of non-intervention which was maintained by the former, by the recognition of the sirdars as well as the Khan, and by the appointment of the British Government as referee in cases of dispute between them. British troops were to be located in the Khan's country; Quetta was founded; telegraphs and railways were projected; roads were made; and the reign of

law and order established. The nebulous claims of Afghanistan to Sibi and Pishin were disposed of by the treaty of Gandamak in the spring of 1879, and the final consolidation of the existing form of Kalat administration was effected by Sandeman's expedition to Kharán in 1883, and the reconciliation of Azad Khan, the great Naoshirwani chief, with the Khan of Kalat. British Baluchistan was incorporated with British India by the resolution of 1st November 1887, and divided into two districts—Quetta-Pishin and Tal Chotiali—to be administered by a deputy-commissioner and a regular staff.

In 1890 and 1891 were carried out that series of politico-military expeditions which resulted in the occupation of the Zhob valley, the foundation of the central cantonment of Fort Sandeman, and the extension of a line of outposts which, commencing at Quetta, may be said to rest on Wana north of the Gomul. The effect of these expeditions, and of this extension of military occupation, has been to reduce the independent Pathan tribes of the Sulimani mountains to effective order, and to put a stop to border raiding on the Indus plains south of the Gomul. In 1893 serious differences arose between the Khan of Kalat and Sir James Browne, who succeeded Sir Robert Sandeman as agent to the governor-general in Baluchistan, arising out of Mir Khudad Khan's outrageous conduct in the management of his own court, and the treatment of his officials. Finally, the Khan was deposed, and his son Mir Mahomed Khan succeeded in November 1893. Since then the most important change in Baluch administration has been the perpetual lease and transfer of management to British agency of the Nushki district and Niábat, with all rights, jurisdiction, and administrative power, in lieu of a perpetual rent of 9000 rupees per annum. This was effected in July 1899. This secures the direct control of the great highway to Sistán which has been opened to Khafila traffic.

The revenues of the Khan of Kalat consist partly of subsidies and partly of agricultural revenue, the total value being about 500,000 rupees per annum. Since 1882 he has received 25,000 rupees as government rent for the Quetta district, besides 30,000 in lieu of transit duties in the Bolan; this has been increased lately by 9000 as already stated. In 1899 the total imports of Kalat were valued at 700,000 rupees, and the exports at 505,000.

AUTHORITIES.—Very little has been published of late years about Baluchistan, in spite of the comparative wealth of new information. This is due to the fact that the records of the surveys of India, both topographical and geological, together with the Gazetteers (all of which are confidential), absorb most of the information collected by Indian Government officials. This article has been compiled chiefly from the unpublished notes of the author.

The following are amongst the most accessible of recent works on Baluchistan which have been published since the Sistán Boundary Report of 1873 by Sir F. Goldsmid:—FLOYER, *Unexplored Baluchistan*, London, 1882.—THORNTON, T. *Life of Sandeman*, London, 1896.—TATE, G. P. *Kalat (a memoir)*, Calcutta, 1896.—HOLDICH, Sir T. "Ethnographic and Historical Notes on Makrán," Calcutta, 1892 (*Survey Report*); "Antiquities, Ethnography, &c., of Las Bela and Makrán," Calcutta, 1894 (*Survey Report*); "Ancient and Mediæval Makrán," vol. vii. *R.G.S. Journal*, 1896; "Perso-Baluch Boundary," vol. ix. *R.G.S. Journal*, 1897.—M'MAHON, "The Southern Borderland of Afghanistan," vol. x. *Journal R.G.S.* 1897. Notes on Sir R. Sandeman's tours in Baluchistan will be found in vols. v., xii., xiii., and xix. of the *R.G.S. Proceedings*.

Bambaraland. See SENEGAL.

Bamberg, a town and archiepiscopal see of Bavaria, Germany, district of Upper Franconia, on the Regnitz, 2 miles above its confluence with the Main, and 39 miles by rail N. from Nuremberg. The church of Our Lady, a Gothic structure of 1320-87, but rebuilt in the Rococo style in the 18th century, contains wood carvings by Veit Stoss. The Altenburg (1266 ft.) has been the fortalice of the prince bishops of Bamberg since 1251, but is of older origin. The former Benedictine monastery of St Michael contains the municipal picture gallery. The royal library has 300,000 vols. and more than 3000 MSS. There is a new astronomical observatory. Of the numerous bridges which span the arms of the Regnitz the principal is the Ludwig bridge, built in 1892. In 1880 the handsome Maximilian fountain, with bronze statues of kings, bishops, and the Emperor Henry II., was set up. Bamberg has developed into an important manufacturing centre, chiefly for cotton spinning and weaving, ropes, and brewing. There is a famous porcelain painting institute. Population (1885), 31,521; (1895), 38,940; (1900), 41,626.

¹ Oldham, *Journal R.G.S.* vol. iii. p. 184.

Bamberger, Ludwig (1823-1899), German economist and politician, was born on the 22nd of July 1823 at Mainz of Jewish parents. After studying at Giessen, Heidelberg, and Göttingen, he entered on the practice of the law. When the Revolution of 1848 broke out he took an active part as one of the leaders of the Republican party in his native city, both as popular orator and as editor of one of the local papers. In 1849 he joined the Free Corps, who attempted a Republican rising in the Palatinate and Baden; on the restoration of order he was condemned to death, but he had escaped to Switzerland. The next years he spent in exile, at first in London, then in Holland; in 1852 he went to Paris, where, by means of private connexions, he received an appointment in the bank of Bischoffheim and Goldschmidt, of which he became managing director, a post which he held till 1866. During these years he saved a competence, and gained a thorough acquaintance with the theory and practice of finance. This he put to account when the amnesty of 1866 enabled him to return to Germany. He was elected a member of the Reichstag, where he joined the National Liberal party, for like many other exiles he was willing to accept the results of Bismarck's work. In 1868 he published a short life of Bismarck in French, with the object of producing a better understanding of German affairs, and in 1870, owing to his intimate acquaintance with France and with finance, he was summoned by Bismarck to Versailles to help in the discussion of terms of peace. In the German Reichstag he was the leading authority on matters of finance and economics, as well as a clear and persuasive speaker, and it was chiefly owing to him that a gold currency was adopted and that the German Imperial Bank took its present form; in his later years he wrote and spoke strongly against bimetalism. He was the leader of the Free Traders, and after 1878 refused to follow Bismarck in his new policy of Protection, State Socialism, and colonial development; in a celebrated speech he declared that the day on which it was introduced was a *dies nefastus* for Germany. True to his Free Trade principles he and a number of followers left the National Liberal party and formed the so-called "Secession" in 1880. He was one of the few prominent politicians who consistently maintained the struggle against State Socialism on the one hand and Democratic Socialism on the other. In 1892 he retired from political life, and died in 1899. Bamberger was a clear and attractive writer, and was a frequent contributor on political and economic questions to the *Nation* and other periodicals. His most important works are those on the currency, on the French war indemnity, his criticism of socialism, and his apology for the Secession. An edition of his collected works (including the French life of Bismarck) was published in 1894 in five volumes. After his death in 1899 appeared a volume of reminiscences, which, though it does not extend beyond 1866, gives an interesting picture of his share in the Revolution, and of his life in Paris. (J. W. H.)

Bamián, a town in Afghanistan, some 80 miles north-west of Kabul. It was visited by Major Maitland and Capt. the Hon. M. G. Talbot during the progress of the Russo-Afghan boundary commission in November 1885. The height of the valley was fixed at about 8500 feet, and the country around it carefully surveyed. The two colossal standing figures carved from the face of the cliff (see ninth ed. ii. p. 307) were measured, and drawings made by a native artist. They proved to be 173 feet and 120 feet high respectively. The Buddhist nature of the figures, and of the caves with which they are surrounded, was verified by the observations of these officers, who discovered other Buddhist caves and excavations in the valleys of the Balkhab

and Sarikol. Chahilburj, 28 miles from Zari, on the road to Balkh by the Balkhab, at the east end of the Sokhtagi valley; Shahr-i-Babar, about 45 miles above Chahilburj; and Gawargin, 6 miles above Shahr-i-Babar, are all fortified sites of about the same age as the relics at Bamián. At Haibak there is a very perfect excavation called the Takht-i-Rustam (a general name for all incomprehensible constructions amongst the modern inhabitants of Afghan Turkestan), which consists of an annular ditch enclosing a platform, with a small house about 21 feet square above it, all cut out of the solid rock. There are hundreds of caves in this neighbourhood, all pointing to a line of Buddhist occupation connecting Balkh with Kabul.

TALBOT, Hon. M. G. "The Rock-cut Caves and Statues of Bamián," *Journal R. Austral. Soc.* vol. xviii. Part 3.

(T. H. H.)*

Bamra, a feudatory state of India, in the Chhattisgarh division of the Central Provinces. Its area covers 1988 square miles. The population in 1881 was 81,286; in 1891, 104,367; and in 1901, 123,289, showing a continuous increase. The estimated revenue is Rs.76,000; tribute, Rs.1500. Most of the country is forest, producing only timber and lac, but said to be rich in iron ore. The northern border is touched by the Bengal-Nagpur railway, with a station at Bamra town.

Banbury, a municipal borough (extended 1889) and market-town in the Banbury parliamentary division (since 1885) of Oxfordshire, England, on the river Cherwell, 77 miles N.W. of London by rail. Recent erections include a temperance hall, an institute, and a municipal secondary and technical school; the infirmary has also been enlarged. Population (1881), 12,072; (1891), 12,768; (1901), 12,967.

Banca (Dutch, *Banka*), an island off the east coast of Sumatra, from which it is separated by Banca Strait, and from Billiton (on its east) by Gaspar Strait. Area, 4458 square miles. Geologically it resembles the Malay Peninsula, its formations being mainly granite, Silurian and Devonian slate, frequently covered with sandstone, laterite (red ironstone clay) of small fertility, and alluvium. The granite extends from W.N.W. to S.S.E., forming the mountain chains (chief range the Maras). As these lie near the east coast, it follows that the rivers of the west coast are the longer. Another chain runs from west to east near Muntok, the chief town. There are no volcanoes on the island. The chief rivers (Jering, Kotta, and Waringin) are navigable nineteen miles from their mouths, and are used for the transport of tin. The rainfall, of great importance for the tin exploitation, is 120 inches yearly. It rains, on an average, 168 days. Politically the island is divided into nine mining districts, including 120 mines, under government control, with, in 1898-99, 12,000 workmen, producing 167,369 piculs of tin. The population in 1898 was 93,600, of whom 260 were Europeans, 32,187 Chinese, 209 Arabs, and about 60,937 natives. The natives cultivate rice, pepper, gambier, Liberia coffee, and the palms, but they are chiefly occupied in fishing and in gathering in the produce of the forests. Industry (mining excepted) is as unimportant as trade. Muntok, the only town of any size, on Banca Strait, has 4000 inhabitants.

ZONDERVAN. *Banka en Zijne bewoners*. Amsterdam, 1895 (with bibliography).—POSEWITZ. *Die Zinn-inseln im Indischen Ocean*. For geology and the tin mines, *Jaarboek voor het Mijnwezen in Ned. Ind.* Amsterdam, 1877-84.

Bancroft, George (1800-1891), American historian and statesman, was born in Worcester, Mass., 3rd October 1800, and died in Washington, D.C., 17th January 1891. His family had been in America since S. II. — 14

1632, and his father, Aaron Bancroft, was distinguished as a revolutionary soldier, clergyman, and author. The son was educated at Phillips Academy, Exeter, at Harvard University, at Heidelberg, Göttingen, and Berlin. At Göttingen he studied Plato with Heeren, New Testament Greek with Eichhorn, and natural science with Blumenbach. His heart was in the work of Heeren, easily the greatest of historical critics then living, and the forerunner of the modern school; it was from this master that Bancroft caught his enthusiasm for minute painstaking erudition. He concluded his years of preparation by a European tour, in the course of which he received kind attention from almost every distinguished man in the world of letters, science, and art; among others, from Goethe, Humboldt, Schleiermacher, Hegel, Byron, Niebuhr, Bunsen, Savigny, Cousin, Constant, and Manzoni. Bancroft's father was a Unitarian, and he had devoted his son to the work of the ministry; but the young man's first experiments at preaching, shortly after his return from Europe in 1822, were unsatisfactory, the theological teaching of the time having substituted criticism and literature for faith. His first position was that of tutor in Harvard. Instinctively a humanist, he had little patience with the narrow curriculum of Harvard in his day and the rather pedantic spirit with which classical studies were there pursued. Moreover, he had brought from Europe a new manner, full of the affections of ardent youth, and this he wore without ease in a society highly satisfied with itself; the young knight-errant was therefore subjected to considerable ridicule. A little volume of poetry, translations, and original pieces published in 1823 gave its author no fame. As time passed, and custom created familiarity, his style, personal and literary, was seen to be the outward symbol of a firm resolve to preserve a philosophic calm, and of an enormous underlying energy which spent itself in labour, "ohne Hast, aber auch ohne Rast." He found the conventional atmosphere of Cambridge uncongenial, and with a friend he established the Round Hill School at Northampton, Mass. This was the first serious effort made in the United States to elevate secondary education to the plane on which it belonged.

Although born into a Whig family, yet Bancroft's studies carried him irresistibly into the Democratic party. While a teacher in his own school he was elected to the State legislature as a Democrat, but under pressure from the family of his first wife, who were ardent Whigs, he refused to serve. In 1831 he likewise declined the nomination of the Massachusetts Democrats for secretary of state. By this time he was influential in the councils of his party, and President van Buren appointed him collector of the port of Boston, a position which he filled with success. Two of his appointees were Orestes Brownson and

Nathaniel Hawthorne. In 1844 he was the Democratic candidate for the governorship, but he was defeated. In 1845 he entered Polk's Cabinet as secretary of the navy, serving until 1846, when for a month he was acting secretary of war. During this short period in the Cabinet he established the naval academy at Annapolis, gave the orders which led to the occupation of California, and sent Zachary Taylor into the debateable land between Texas and Mexico. He also continued his pleadings for the annexation of Texas, as extending "the area of freedom," and though a Democrat, took high moral ground as to slavery; he likewise made himself the authority on the North-Western Boundary question. In 1846 he was sent as minister to London, where he lived in constant com-

panionship with Macaulay and Hallam. On his return in 1849 he withdrew from public life, residing in New York. In 1866 he was chosen by Congress to deliver the special eulogy on Lincoln; and in 1867 he was appointed minister to Berlin, where he remained until his resignation in 1874. Thenceforward he lived in Washington and Newport. His latest official achievements were the greatest. In the San Juan arbitration he displayed great versatility and skill, winning his case before the emperor with brilliant ease. The naturalization treaties which he negotiated successively with Prussia and the other North German States were the first international recognition of the right of expatriation, a principle since incorporated in the law of nations.

In spite of the exacting and severe routine of the Round Hill School, Bancroft contributed frequently to the *North American Review* and to Walsh's *American Quarterly*; he also made a

translation of Heeren's work on *The Politics of Ancient Greece*. In 1834 appeared the first volume of the *History of the United States*. The second followed in 1837, and others as the exigencies of public life permitted. Supplementary to the first volume was an article published by him in the *North American Review* for 1835 on "The Documentary History of the Revolution." This article not merely brought the new method to the notice of the reading public, but revealed to it the wealth of material available. The nature and extent of his studies, the solidity of his work, and the philosophic spirit which animates both, explain the enthusiasm with which the earlier volumes of Bancroft were received. Their sale at home was very large; they were reprinted in England, and translated immediately into Danish, Italian, German, and French. The latest volumes were considered by all competent judges quite as important as their predecessors. When the author was preparing to return from Berlin, the Royal Academy made him their guest at a public dinner, an unprecedented honour; and the universities of Berlin, Heidelberg, and Munich united in a testimonial of regard. At Washington he was the confidential adviser of states-

GEORGE BANCROFT.

men to the end of his life, and the unofficial dean of the best society.

Bancroft's historical creed is best set forth in the address he delivered on the semi-centennial of the New York Historical Society in 1854. In philosophy he found the basis for positing a collective human will, revealing in its activities the materials for determining ethical laws. Since there must be the same conservation of energy in morals as elsewhere, the eternal reason is the divine Logos. History, therefore, is God working in examples. It must be a unit, its forces constant, and its totality an organic whole. Within this the individual moves and acts with liberty and responsibility; for each, in will, affection, and intellect is consubstantial with the rest. Truth, morals, and justice are subject to no evolution; but the collective man evolves better forms of knowledge and behaviour. The organization of society, therefore, produces successive states, in each of which the principle of freedom is better established than in the antecedent. Permanency in republican government is, therefore, based upon corresponding experience and culture, and its possibilities grow ever stronger. The relation of American democracy to the systems which have preceded it forms the latest proof of these contentions. As Heeren's pupil, he laid enormous stress on the importance of original authorities. In dealing with documentary evidence he sought to apply very stringent rules:—(1) Carefully distinguish between original authority and historical memorials or aids; for example, between a fact recorded at first- or second-hand knowledge, and a decision of principle by authority. (2) Represent every man from his own standpoint; judge him from your own. His collections of original material were vast; beginning with his residence in England, he brought together at enormous pains and expense the authenticated copies of archives, family papers, and personal journals written by historic personages, which now constitute an invaluable treasure in the New York public library. They are from every land and from every people with which American origins are connected. His use of this material was not always according to accepted standards. To avoid dryness and prolixity he condensed quotations, and occasionally employed the Thucydidean method of abridgment or representation in place of fact catalogues. During his long life enormous strides were made by others in collecting the materials of American history, and while in the main he kept pace with them by ruthless revision, yet even the latest edition of his work disregards some minor facts which others knew for the insertion of much which the author alone knew.

Bancroft's imagination and enthusiasm were alike exuberant. His pages abound in fine and acute insight. His generalizations are vivid and enlightening. He spared no pains to acquire true style, frequently rewriting his chapters, and sometimes testing passages of philosophy and description in eight different forms. Yet to a certain extent he lacked the representative power and often failed to conceal his art, many pages ringing with artificial tones. But, after making all allowances, it remains true that he had a perfect sense of proportion, sound maxims, and thorough common-sense. He was of that greatest human type: a man of the present, valuing justly the past, and no dreamer. In the nature and extent of his studies, in the solidity of his work, and in the philosophic spirit which animated his life he ranks as the foremost historian of the United States, and as an American historian second to none of his European contemporaries in the same line. He displayed the heroic, epic value of American history, the unity of its course with the great central stream, and dispelled for ever the extravagant conceptions of a sentimental world just emerging from the visionary philosophy of the 18th century. (W. M. S.)

Bancroft, Hubert Howe (1832—), American historical writer, was born at Granville, Ohio, on the 5th of May 1832. From 1852 to 1868 he was a publisher in San Francisco. During this period he accumulated a great library of historical material, and at last gave up business in order to devote himself to the collection and publication of an extensive *History of the Pacific Coast of North America*. This work is comprised in no less than thirty-one octavo volumes, besides some subsidiary treatises, autobiographical data, &c., and includes ethnography, archæology, and history. As the compiler necessarily relied upon the labours of a corps of assistants, his work is, properly speaking, an encyclopædia rather than a unified history; but as a storehouse of material its value is great, and is likely to be enduring.

Bancroft, Sir Squire. See DRAMA.

Banda, a town and district of British India, in the Allahabad division of the North-West Provinces. The town is on the right bank of the river Ken, 95 miles south-west of Allahabad. The population is about 23,000; the municipal income in 1897-98 was Rs.26,531. The town possesses 66 mosques and 161 Hindu temples. It has also a church and an English high school. It is no longer a military cantonment.

The district of **BANDA** is the most barren and most backward portion of the province. It contains an area of 3060 square miles. The population in 1891 was 705,832, being 231 persons per square mile; Hindus numbering 664,810, Mahommedans 40,662, Christians 74, including 30 Europeans. In 1901 the population was 631,337, showing a decrease of 11 per cent., due to the effects of famine. Land revenue and rates were returned as Rs.7,06,341, the incidence of assessment being 10 annas per acre; the number of police was 2308. In 1896-97, out of a total cultivated area of 662,855 acres, only 5938 were irrigated. The principal crops are millet, other food-grains, pulse, rice, cotton, and oil-seeds. Banda cotton enjoys a high repute in the market. A branch railway from Manikpur to Jhansi traverses the length of the district, which is also crossed by the main line of the East Indian to Jubbulpur.

Banda Islands, a group of three chief and several lesser islands in the Banda Sea, south of Ceram (East Indian archipelago), forming, with Waru (the eastern portion of Ceram) and the islands of Ceram Laut and Goram, a district of the Dutch residency of Amboyna. The main islands are Great Banda or Lontor, Banda Neira to its north, Gunong Api (west of Banda Neira), Wai or Ai (still farther west), with Run on its south-west. The group (total area under 19 square miles) shows parts of a volcanic formation resembling that of Santorin (in the Ægean). The production of late years has amounted to 9600 piculs (a picul = 159 lb) nutmegs and 2400 piculs mace. The capital of the group is Banda (on B. Neira), seat of the Assistant Resident. Jalti or jatti wood is cultivated on the island of Rosingen. The total population of the islands is about 6000, descendants of the Javanese inhabitants of the neighbouring islands. They are Christians and Mahommedans.

Bander Abbási, a town of Persia, on the Persian Gulf, and now forming part of the administrative division of the "Persian Gulf ports," whose governor resides at Bushire. It has a population of about 10,000, an insalubrious climate, and very bad water.

Bander Abbási was called Gombrún (Gombroon, Gamaroon; Comron and Komoran of Portuguese writers) until 1622, when it received its present name in honour of the reigning shah, Abbás I. About 1740 Nadir Shah granted the town and district, with the fort of Shamíl and the town of Mináb, together with the islands of

Kishm, Hormúz (Ormus), and Larak to the Arab tribe of the Beni Ma'ini in return for payment of a yearly rent or tribute. About forty years later Sultan bin Ahmad, the ruler of Maskat, having been appealed to for aid by the Arab inhabitants of the place against Persian misrule, occupied the town and obtained a firman from the Persian Government confirming him in his possession, on the condition of his paying a yearly rent of a few thousand tomans. The islands were considered to be the property of Maskat. In 1852 the Persians expelled the Maskat authorities from Bander Abbási and its district, but retired when Maskat agreed to pay an increased rent. By a treaty concluded between Persia and Maskat in 1856 it was stipulated that Bander Abbási, town and district and the islands, were to be considered Persian territory, and leased to Maskat at an annual rent of 14,000 tomans. The treaty was to have been in force for twenty years, but in 1866 the Persian Government took advantage of the assassination of Sayyid Thuwaini, the sultan of Maskat, to install as governor of Bander Abbási and district a nominee of its own, who agreed to pay a rent of 20,000 tomans per annum. Further difficulties arising between Persia and Maskat, and the ruler of the latter, then in possession of a powerful fleet, threatening to blockade Bander Abbási, the Persian Government solicited the good offices of the British Government, and the lease was renewed for another eight years upon payment of 30,000 tomans per annum. This was in 1868. In the same year, however, the sultan of Maskat was expelled by a successful revolt, and the Persian Government, in virtue of a clause in the lease allowing them to cancel the contract if a conqueror obtained possession of Maskat, installed their own governor at Bander Abbási, and have retained possession of the place ever since (Curzon, *Persia*, ii. 424).

Bander Abbási has a lively trade, exporting much of the produce of Yezd and Kermán and Eastern Persia, and supplying imports to those districts and Khorassan. Bander Abbási has a British post office, and the mail steamers of the British India Steam Navigation Company call at the port weekly. The following table shows the value of the exports and imports from and to Bander Abbási in thousands of pounds sterling, and the shipping entered and cleared at the port in thousands of tons, according to British consular reports:—

Year.	Exports.		Imports.		Shipping.			
					Total.		British.	
	Total.	British.	Total.	British.	Entered.	Cleared.	Entered.	Cleared.
1887	278	136	323	307	103	103
1890	348	201	409	393	72	72	61	62
1895	325	237	478	435	No returns available.			
1896	180	125	364	341	107	104	88	87
1897	231	121	382	348	94	89	88	83
1898	187	112	449	422	87	86	79	79

Bander Lingah, a town of Persia, on the Persian Gulf, and about 300 miles by sea from Bushire, in 26° 33' N. lat. and 54° 54' E. long. It forms part of the administrative division of the "Persian Gulf ports," whose governor resides at Bushire, and has a population of about 10,000. The following table shows the value of the exports and imports from and to Bander Lingah, in thousands of pounds sterling, and the shipping, in thousands of tons, according to British consular reports. Nearly one-half of the exports and imports is in pearls, which pass Bander Lingah in transit from the fisheries on the Arab coast to Bombay:—

Year.	Exports.		Imports.		Shipping.			
					Total.		British.	
	Total.	British.	Total.	British.	Entered.	Cleared.	Entered.	Cleared.
1887	523	308	526	273	99	92
1890	592	362	665	381	187	203	157	175

1896	498	274	425	156	129	107	97	74
1897	548	270	532	288	115	92	93	73
1898	571	287	641	347	125	76	102	58
1899	552	269	612	344	125	68	99	48

Like many other Persian Gulf ports, Bander Lingah was

for many generations a hereditary patrimony of the sheikh of an Arab tribe, in this case the Jovasmi tribe, and it was only in 1898 that the Arabs were expelled from the place by a Persian force. Bander Lingah is the chief port for the Persian province of Laristan, and has a thriving trade with Bahrein and the Arab coast. It has a British post office, and the British India Company's steamers call there weekly.

Banff, a royal and parliamentary burgh (Elgin group) and the county town of Banffshire, on Moray Firth, 50 miles N.N.W. of Aberdeen by rail. In 1888, 425 vessels of 37,377 tons entered; in 1898, 449 vessels of 43,772 tons. Coal and timber are the principal imports. (For statistics of the fishery district of which Banff is the centre see the following article.) Population of municipal burgh (1891), 3876; (1901), 3730; of parliamentary burgh, which includes Macduff (1891), 7578; (1901), 7148.

Banffshire, a maritime county of N.E. Scotland, bounded on the N. by the Moray Firth, on the E. and S. by Aberdeenshire, and on the W. by Elgin and Inverness shires.

Area and Population.—In 1891 the Aberdeen portion of the parish of Cabrach was placed in Banff; the Banffshire portions of Cairnie and King Edward were separated from the Aberdeen portions and transferred to other Banff parishes; Gartly, Glass, New Machar, Old Deer, and St Fergus were wholly transferred to Aberdeen. Of parishes divided between Banff and Elgin, Boharm, Inveravon, and Keith were placed wholly in the former, and Bellie and Rothes in the latter. According to the latest official estimate the area of the county is 405,432 acres, or about 633½ square miles. The population was in 1881, 62,736; in 1891, 64,190, or, on the above area, 61,684, of whom 29,547 were males and 32,137 females. On the old area, taking land only (410,112 acres or 640·8 square miles), the number of persons to the square mile in 1891 was 100, and the number of acres to the person 6·4, the county ranking fourteenth in Scotland in respect of density of population. In the registration county the population increased between 1881 and 1891 by 2·8 per cent. In 1901 the population was 61,487. Between 1881 and 1891 the excess of births over deaths was 9593, and the increase of the resident population 1713. The following table gives particulars of births, deaths, and marriages in 1880, 1890, and 1899:—

Year.	Deaths.	Marriages.	Births.	Percentage of Illegitimate.
1880	1000	337	1873	16·0
1890	1055	318	1837	14·86
1899	1006	361	1797	13·4

The birth-rate, death-rate, and marriage-rate are all below the rates for Scotland. The following table gives the birth-rate, death-rate, and marriage-rate per thousand of the population for a series of years:—

	1880.	1881-90.	1890.	1891-98.	1899.
Birth-rate . . .	31·37	32·16	30·06	29·10	28·43
Death-rate . . .	16·75	16·30	17·26	15·37	15·91
Marriage-rate . .	5·64	5·73	5·20	5·73	5·71

The number of Gaelic-speaking persons in the county in 1891 was 638, of whom 3 spoke Gaelic only, and there were 5 foreigners. Valuation in 1889-90, £242,149; in 1899-1900, £261,677.

Administration.—The county returns a member to parliament. Royal burghs are Banff (3730) and Cullen (4059), which belong to the Elgin group of parliamentary burghs, the parliamentary burgh of Banff having a population of 7578 in 1891. The chief police burghs are Buckie (6541), Keith (4753), and Macduff (3418). There are 22 civil parishes, most of which belong to the Buchan Combination, and the number of paupers and dependants in September 1899 was 1587. Banffshire forms a sheriffdom with Aberdeen and Kincardine shires, and there is a resident sheriff-substitute at Banff, who sits also at Keith, Buckie, and Duftoun.

Education.—Twenty-five school boards manage 73 schools, which had an average attendance of 10,878 in 1898-99, and 14 voluntary schools (6 Roman Catholic and 4 Episcopal) with an average attendance of 1157. Twenty-five schools earned grants in 1898 for giving higher education, and the county council out of the "residue" grant subsidizes classes in agriculture, navigation, veterinary science, and cookery and laundry work.

Agriculture.—The percentage of cultivated area was 36·9 in 1898. Barley grows well in most parts of the county, and the demand of

distillers tends to keep up the acreage, though the predominant crop is oats; the barley acreage was 11,725 in 1898 and 16,504 in 1899, and the oat acreage was 46,874 in the latter year. Cattle-feeding is, however, the staple agricultural industry. There is also a fair proportion of dairy farming. The following table gives the principal acreage at intervals of five years from 1880 :—

Year.	Area under Crops.	Corn Crops.	Green Crops.	Clover.	Permanent Pasture.	Fallow.
1880	167,317	62,099	28,875	67,097	8,946	300
1885	168,595	62,457	27,978	65,558	12,299	273
1890	172,563	62,238	28,368	69,618	11,000	312
1895	160,240	57,810	25,508	62,801	13,959	140
1899	160,260	57,640	25,031	67,665	9,862	88

The following table gives particulars of the live stock in the same years :—

Year.	Total Horses.	Total Cattle.	Cows or Heifers in Milk or Calf.	Sheep.	Pigs.
1880	8127	40,259	12,548	49,128	2837
1885	8072	43,574	13,682	57,816	3920
1890	8381	45,216	13,970	68,262	4306
1895	8881	41,764	12,470	62,703	2461
1899	8915	44,561	13,377	71,400	2735

Of 3737 holdings in 1895, the date of the last return, the average size was 43 acres. The percentage under 5 acres was 20·84, between 5 and 50 acres 51·73, and above 50 acres 27·43. Farms between 50 and 100 acres numbered 556; between 100 and 300, 439; and over 300 acres, 30; only 2 being over 500 acres. There were 30,955 acres under wood in 1895. According to the census of 1891 there were 7139 men and 415 women engaged in agriculture.

Industries and Trade.—Woollen factories have spread to Dufftown, Rothiemay, and Gollachy, and engineering works in Banff, Portsoy, and Keith are of importance. There are seven harbours at which a miscellaneous and fish trade is done—Banff, Macduff, Buckie, Gardenstown, Portsoy, Cullen, and Port Gordon; and fishing is prosecuted at fourteen creeks or harbours along the Banffshire portion of the Moray Firth. The herring season lasts from June to September; white fishing is prosecuted all the year round. There are two fishery districts in the county centring respectively in Banff and Buckie, for which, conjointly, the following table gives statistics :—

Year.	Boats.			Value of Gear.	Resident Fishermen and Boys.	Total Value of all Fish.
	No.	Tons.	Value.			
1890	1221	17,101	£135,664	£129,872	5110	£125,852
1898	1161	21,714	£202,819	£152,676	3512	£80,926
1899	1197	23,064	£218,874	£387,023	5364	£79,692

The herring catch only was valued at £41,478 in 1899. The number of persons employed in the two districts in 1899 in connexion with the various branches of the sea fisheries was 5787. Banff contains large limestone deposits; 24,863 tons valued at £9385 were raised in 1895, and 38,355 tons valued at £5819 in 1899; there is also a little granite-quarrying, the output being 1470 tons in 1895 and 7438 tons in 1899. The total industrial population in 1891 was 5175 men and 1479 women. The Great North of Scotland and the Highland Railway Companies have together added 30 miles to the railway mileage of the county.

Bánffy-Hunyad, a market-town of the county of Kolozs in Hungary. In the neighbourhood rise the romantic castles of the noble families Bánffy and Barcsai. It is the centre of the Hungarian tribe of Kalotaszeg, famous for its picturesque dressing, old songs, and popular customs, but especially for its beautiful female handiwork, the so-called "Kalotaszégi varrottas." Population, about 4500.

Bangalore, a city of India, the capital of the native state of Mysore and also a British cantonment. It is 3113 feet above the sea, 216 miles west of Madras by rail. The total area is about 15 square miles. The total population in 1881 was 155,857, in 1891 it was 180,366, and in 1901 it was 159,030, showing a decrease of 12 per cent., due to the effects of plague. When the state of Mysore was restored to its raja in 1881, the civil and military station of Bangalore was permanently reserved under British jurisdiction as an "assigned tract." It has an area of 12·4 square miles, and had in 1881 a population of 93,540; in 1891 of 100,081, of whom 17,902 were Christians; and in 1901 of 159,030. The municipal income in 1897-98 was Rs.3,29,097; the number of boys at school was 5227, of girls 2610, giving a total of 7837, or 52 per cent. of the estimated population of school-going age; the registered death-rate in 1897 was 21·53 per thousand. Bangalore is the headquarters of a military district, with accommodation for a strong force of all arms and an arsenal in the old fort. A considerable number of European pensioners reside here. A new palace has been built for the Maharaja. There is an aided Roman Catholic college, besides many schools for Europeans. A permanent water-supply has been introduced, and a complete system of drainage is under consideration. Bangalore is an important railway centre. There are two cotton mills with 248 looms and 30,872 spindles, employing 1600 hands; four breweries, with an annual out-turn of 470,000 gallons. The city suffered severely from plague in 1899 and 1900.

The district of BANGALORE borders on the Madras district of Salem. Its area is 2559 square miles; its population in 1881 was 669,139, and in 1891 it was 802,994, showing an increase of 20 per cent., or an average density of 314 per square mile, being considerably the highest rate in Mysore; in 1901 the population was 877,927, showing a further increase of 9 per cent. The district is crossed by several lines of railway. Outside Bangalore city there is a woollen mill with 38 looms and 1088 spindles, employing 200 hands, which turns out blankets, cloth for greatcoats, and woollen stuffs to the annual value of Rs.2,51,600.

Banganapalle, a state of Southern India, surrounded by the Madras district of Kurnool. Area, 255 square miles; population (1891), 35,496; (1901), 32,279. Estimated revenue, Rs.2,23,000, of which a large portion is alienated in grants to junior branches of the family; no tribute; number of schools, 20, with 671 pupils in 1897-98. The town of BANGANAPALLE is situated in 15° 15' N. lat. and 78° 20' E. long., not far from the branch of the Southern Maratha Railway from Guntakal to Bezware.

Bangkok, the capital of Siam, situated on the river Me Nam, in 100° 30' E. long. and 13° 45' N. lat., underwent great changes and developments within the last quarter, and especially during the last decade, of the 19th century. The main streets are now for the most part wide, well-made, well-policed, and lighted with electricity. The town is traversed by electric trams, and the river is crowded with steamers. The larger ships are specially built with flat bottoms for crossing the bar, where no improvement has yet been effected by the Government, and the maximum depth at high water does not exceed 15 feet. The more important European countries and the United States are now represented by a minister plenipotentiary and a consular staff, and the European colony has increased to over 600 in number, and includes representatives of many of the best-known firms in the East and of the more important banks. The town is connected with Paknam at the mouth of the river by a

steam tramway, and the railway to Korat, on the lower sections of which the traffic has been steadily increasing, was opened for traffic to that place towards the end of 1900. The affairs of the town were for a long time controlled by a Local Government Department. Latterly a Sanitary Board has been created, and has done excellent work, not before it was needed. In the near future a municipality will probably be formed in which the European residents will be represented in proportion to their interests, in which case it may be expected that the long-talked-of waterworks and drainage scheme will be effectively carried out. There are good dispensaries and hospitals, and French, Roman Catholic, and American Protestant missions. Steps are being taken to improve primary education by raising the efficiency of the monastery schools and bringing them under regular Government supervision. The population, though composed principally of Siamese and Chinese, includes representatives of every race to be found in Indo-China, as well as a large number of natives of India. The total has been variously estimated, and probably exceeds 400,000.

The climate, though enervating from the humidity of the atmosphere, is not one of extreme heat, owing to its proximity to the gulf, from which during the hot season (February to April) a strong sea-breeze blows nearly every day. 93° Fahr. is an exceptional maximum in the daytime, and at night the thermometer generally falls below 90°, and renders sleep possible. In the rainy season (May to October) there is a rainfall which seldom exceeds 50 inches. The cold season which follows is dry and pleasant, the temperature at night occasionally falling below 70° Fahr.

In 1888, 472 ships of 352,445 tons (396 of 300,247 tons, steam) cleared the port; in 1898 the total number was 524 of 453,341 tons (509 of 444,653 tons, steam). These figures do not include junks, of which from 200 to 300 enter the port from the Malay peninsula, Cambodian, and South China ports in the course of the year. For the ten years ending 1898 British shipping averaged 74 per cent. of the whole, and in value of cargoes carried reached an even higher percentage. The transference of both the Holt Singapore and Scottish Oriental Hongkong lines to the German flag in 1899, and the enterprise of the Danish East Asiatic Company, will effect a considerable reduction in these figures in the next few years. In 1889 the total exports were valued at £2,286,280, and in 1899 at £3,123,775; the value of the rice output in 1899 was £2,223,953, and of teak £323,867. The imports in 1889 were valued at £1,593,257, and in 1899 at £2,532,137, treasure being the largest item in both years, followed by cotton goods, opium, silk goods, gunny bags, iron, steel, and machinery.

For recent authorities, see SIAM.

(H. W. SM.)

Bangor, a municipal (1883) and contributory parliamentary borough (Carnarvon district), seaport, and market town of Carnarvonshire, North Wales, at the north end of Menai Strait, 240 miles W. of London by rail. The Cathedral has been restored; there are three other churches and twenty-one Nonconformist chapels. The town council possess the gas and water works, electric light works, a fine promenade pier and ferries, fine (enclosed) open-air sea-water baths, museum and reading-room, infectious diseases hospital, and public cemetery. The University College of North Wales (1883) is located here, and a hall for female students has been provided. There are also the Independent and Baptist Colleges, the Normal College, the North Wales Training College, and two intermediate schools (boys and girls), two public halls, and an infirmary. Area of municipal borough, 1208 acres. Population (1881), 9005; (1901), 11,269.

Bangor, a city and seaport of Maine, U.S.A., capital of Penobscot county, situated in the southern part of the State, on the west bank of Penobscot river. Several branches of the Maine Central Railway have their

termini here. Power for manufacturing is supplied by the Penobscot, and the city has large and varied manufactures. The lumber business is, however, still of the greatest importance, 175,000,000 feet of lumber being sawn annually. Population (1880), 16,856; (1900), 21,850.

Bangweulu, a shallow lake of Eastern Central Africa, roughly oval in shape, formed by the head stream of the Congo. It lies between 10° 48' and 11° 31' S. lat. and is cut by 30° E. long. Except on the west, its shores are fringed with marsh, overgrown with reeds and papyrus. The three islands Kirui, Kisi, and Mbawala much diminish the extent of open water, the channel between the two former being 3½ miles wide with a depth of 12½ feet, and that between Kisi and Mbawala nearly 5 miles with 15 feet in the centre. On the west shore a long narrow peninsula almost separates the lakelet Chifunawuli from the main body of water. The Chambezi, the most remote head stream of the Congo, enters the south-east corner through a mass of aquatic vegetation, while some 25 miles farther west the Luapula makes its exit through a vast marsh extending to 12° 20' S. lat. Though heard of by the Portuguese traveller Lacerda in 1798, Bangweulu was first reached in 1868 by Dr Livingstone, who died six years later among the swamps to the south. It was partially surveyed in 1883 by the French traveller Giraud, and first circumnavigated by Mr Poulett Weatherley in 1896. Its altitude is about 3700 feet.

See *Geographical Journal*, vol. xii. p. 241; vol. xiv. p. 561.

Banjermasin (Dutch, *Bandjermasin*), a district in the south-east of Borneo, on the Barito, now, after much fighting and insurrection, the chief district in the residency of South and East Borneo. The seat of the Resident is at the town of Banjarmasin, in 3° 18' S., 114° 35' E., on the left bank of the Barito, where its tributary, the Martapura, forms with it the small island of Tatas. As both these rivers are navigable for large vessels, the town is a trade-centre for the products of all the districts along their banks (benzoin, rattans, wax, gold, diamonds, iron, and weapons). The population in 1898 was 48,021, including 2230 Chinese, 882 Arabs, and 531 Europeans.

Bankim Chandra Chatterji (1838-1894), the greatest novelist of India in the 19th century, was born in the district of Twenty-four Parganas in Bengal in 1838. He received an English education, first in the Hugli College, and then in the Presidency College of Calcutta, and he was the first B.A. of the Calcutta University. Shortly after leaving college he published his first historical novel, the *Durges-Nandini*, or *The Chieftain's Daughter*. To Bankim Chandra is due the credit of creating in India a school of fiction after the modern European model. His first work, named above, and modelled upon the style of Sir Walter Scott, made a great sensation in Bengal. It was followed by the *Kapala-Kundala* and the *Mrinalini*, and established his fame as a writer, with a creative imagination and a power of delineation as yet unsurpassed in India. In 1872 he brought out his first social novel, the *Bisha-Brikha*, or *The Poison Tree*, which was followed by others in rapid succession. For over twenty years the reading public in Bengal recognized and felt the power of the talented novelist, and Bengali ladies in the zenana read every new work of Bankim Chandra as it issued from the press. During all these years Bankim Chandra was serving the British Government as a deputy-magistrate in various districts of Bengal. His ability as a magistrate and as an official was appreciated, and on his retirement he was decorated and made a Companion of the Indian Empire. In his last years he wrote on Hindu religion, and died in 1894. Some of his novels have been

translated into English by Mrs Knight; and although numerous works of fiction are now annually produced in every province in India, Bankim Chandra still holds the first place. He gathered round him a number of literary men who have left their impress on the literature of Bengal. In his earlier years he served his apprenticeship in literature under ISWAR CHANDRA GUPTA, the chief poet and satirist of Bengal during the earlier half of the

19th century. Bankim Chandra's friend and colleague, DINA BANDHU MITRA, was virtually the founder of the modern Bengali drama. Another friend of his, HEM CHANDRA BANERJEE, was a poet of recognized merit and talent. And among the younger men who venerated Bankim Chandra, and benefited by his example and advice, may be mentioned two distinguished poets, NALIN CHANDRA SEN and RABINDRA NATH TAGORE. (R. C. D.)

BANKING.

I. HISTORY AND STATISTICS.

British Banks.

THE following article is confined generally to the state of affairs at the present time, and with respect to the United Kingdom does not go back farther than to the date when Sir Robert Peel's Bank Acts of 1844-45 were passed. These Acts have greatly influenced the present position of banking in Great Britain and Ireland, and it is necessary to begin with them, although to render the history intelligible some references must be made to earlier events. The charter of the Bank of England was dated 27th July 1694. Originally established to advance the government a loan of £1,200,000, the management of the National Debt of the country has been confided to it ever since its foundation, and it has always remained the banker of the Government. The interest on the stock in which the debt is inscribed has always been paid by the bank, originally half-yearly, now quarterly, and the registration of all transfers of the stock itself is carried on by its officers. The bank also assumes the responsibility of the correctness of all the transfers. These circumstances and the monopoly granted to it from the date of its foundation till 1826, of being the one joint stock bank in England and Wales and also of issuing notes which, since 1833, have been legal tender in England and Wales everywhere except at the Bank of England itself, combined with the fact that besides being the banker of the Government it is the banker of the other banks of the country, and for many years had the control of far larger deposits than any one of them individually, gave it early a pre-eminence over all the other banks. This pre-eminence it still maintains, though more than one competitor now holds larger deposits, and though, collectively, the deposits of the other banks of the country which have offices in London many times overpass its own. In one sense the power of the Bank of England is greater now than ever. By the Act of 1844, regulating the note-issue of the country, the Bank of England became the sole source from which legal tender notes can be obtained, a power important at all times, but pre-eminently so in periods of pressure. The authority to supply the notes required, when the issue needs to overpass the limits of the Act of 1844, is given by the Government at the request of the bank. Hence the Bank of England becomes the centre of interest at the times when a "Treasury letter" is required, and holds then a power, the force of which can hardly be estimated. In the early days of the business in England, issuing notes formed, as Bagehot says in his *Lombard Street*, the introduction to the system of deposit banking—so much so, that a bank which had not the power of issuing notes could scarcely exist out of London, where traditional custom associated with the "Goldsmiths," who took deposits from the time of James I. onwards, had established "deposit banking" as early as the 17th century.

The Bank of England possessed a practical, though perhaps not an absolutely legal monopoly of issuing notes in London, and was gradually surrounded by a circle of

private banks, some of considerable power. The purely city banks associated themselves at the "Clearing House" as early as 1776. The Bank of England has never formed a member of this body, though it "clears on one side,"—i.e., its claim on the clearing bankers is made through the clearing house, but the claims of the clearing bankers on the Bank are forwarded direct to Threadneedle Street twice or thrice daily. Nor did the banks in Fleet Street or at Charing Cross ever belong to it. In 1858 the clearing of country cheques was added through the arrangements made by Sir John Lubbock (afterwards Lord Avebury). The "country clearing" is a great assistance to business, as it enables a cheque drawn on the most distant village in England to be dealt with as conveniently as a cheque on London. The Bank of England, as stated before, was incorporated by the Act of 1694. The position of the other banks at that time was defined by the Act of 1697, which declared that no bank, that is, no joint stock bank, was "to be established within England during the continuance of the Bank of England," and by the Act of 1708, which provided that "during the continuance of the Bank of England, no company or partnership exceeding six persons, in England" should "borrow, owe, or take up any sum or sums of money on their bills or notes, payable on demand, or at any less time than six months from the borrowing thereof." This was confirmed by the Act of 1800. No change of importance was made till the Act of 1826, which prohibited "bank notes under £5," and the second Banking Act of that year. This act allowed the establishment of co-partnerships of more than six persons, which necessarily were "Joint Stock Companies," "beyond 65 miles from London." The Act of 1833 allowed the establishment of joint stock banks within the 65-miles limit, and took away various restrictions of the amounts of notes for less than £50. But the power of issuing notes was not allowed to joint stock banks within the 65-miles radius.

As during the whole of the period from 1694 to 1826 and 1833 no bank could be formed with more than six partners, the majority of the banks throughout England and Wales, for more than a century, were necessarily small and usually isolated firms. Those in the country districts had frequently branches in the small market towns close to them, those in London had never more than one office. These banks were sometimes powerful, but absolute secrecy was preserved as to the particulars of their business, the amount of capital employed in it and of deposits held. This secrecy was preserved by many of the private banks as late as the year 1890. Messrs Glyn, of Lombard Street, who assumed the joint stock form with unlimited liability in 1885, took the lead in the movement for publishing accounts. It was some time before the practice became general. The restriction of partners in private banks to six continued till 1862. By an Act passed in that year they were allowed to be ten. This, however, did not extend to issuing banks, who were restricted to six as before. The power of increasing bank partnerships to ten has been but little made use of.

The difficulties of carrying on business on a large scale were augmented by certain legal technicalities which practically rendered large private banks impossible in ordinary circumstances. Hence banking business did not begin to assume its present form till almost half-way through the 19th century. The gradual change followed the passing of the Acts of 1826-33 and 1844-45. Incidentally the latter legislation had an unexpected influence in promoting the formation of large and powerful banks. The main features of the Act of 1844 are as follows:—By it the Bank of England was divided into two departments, one concerned with the issue and the other with the banking business; no new bank of issue whatever was allowed to be established; restrictions were placed on the English issuing banks. Private issuing banks with not more than six partners were allowed to remain, to amalgamate and retain their issues. The joint stock banks which possessed issues were also allowed to continue these, but when two joint stock banks amalgamated, the continuing bank only retained its issue. Also when a private issuing bank was formed into or joined a joint stock bank, the issue lapsed. All the larger provincial banks in England and Wales had practically been banks of issue up to 1844. The enactments of that year, besides separating the Issue Department from the Banking Department of the Bank, were arranged with the intention of concentrating the note issues on the Bank of England in order to secure the

monopoly of that bank as the one issuer of notes in England and Wales. The result has been that nearly all the provincial banks in England had by 1901 lost the right of issue. Probably all will do so unless legislation is introduced to resuscitate the local issues in a form which will render them secure and enable them to be as useful to banking in England as the local issues have been to Scotland and Ireland. No security was ever provided for the local issues in the United Kingdom. The requirements of the Acts of 1844-45, which compel the Irish and Scottish banks to hold specie against the notes issued beyond the legal limit, do not appear to make the coin held a security for them. The legislation of 1879, which made them a first charge, with unlimited liability, on the total assets of the joint stock banks which accepted the principle of limited liability for the rest of their business, has been the only recognition of the duty to the note-holders of rendering them secure. It has been a real disadvantage to England that this duty has not been sufficiently recognized. A different policy was followed by Sir Robert Peel in Scotland and Ireland. By the Acts of 1844-45, the Scottish and Irish banks were allowed to exceed their authorized issue on holding specie to the amount of the excess and no restrictions were placed on amalgamations among banks in these countries. In Scotland, and also in Ireland, notes for less than £5 continued to be allowed. The result has been that the ten large banks in Scotland, and six of the nine banks in

BANK OF ENGLAND (*New Form*).

Deposits at Branches	1,209,000	Exchequer Bills, Stock, &c.	661,000
	<u>8,644,000</u>		<u>5,719,000</u>
	<u>£33,482,000</u>		<u>£21,897,000</u>
		Bullion	15,209,000
			<u>£37,046,000</u>

¹ This includes seven day and other bills.

Ireland, possess the power of issuing notes. The large proportion of local branches in these countries has been greatly assisted by this power.

The immediate effect of the division of the Bank of England into the two departments—the issuing department and the banking department—is best shown by comparing the weekly statement of the liabilities and assets of the Bank of England of the 7th September 1844, the date when the first publication of accounts was made, according to the old and the new form. The figures are as given on page 75.

On examining the statement according to the “old form,” it will be seen that the main difference between the two sides of the account

Dr. £33,482,000	Cr. £37,046,000
is the rest	3,564,000 (omitted in the “old,” incorporated in the “new form”).
£37,046,000	

The “Proprietors’ Capital,” £14,553,000, and the Government securities held against it, £14,554,834, are both omitted in the “old form,” but the principal effect of the Act of 1844 is shown by the figures in the issue department shown in the “new form.” It will be observed that against £14,000,000 of the notes issued, securities were held, principally Government securities, but the remainder of the issue was made against bullion. £8,175,025 of the notes are returned as in the banking department, which had accordingly that amount of specie at its disposal, or rather of notes against which specie was held. Hence, if through any circumstance the Bank of England were called on for a *larger* sum in notes or specie than the notes in its “banking department,” now technically spoken of as the “reserve,” amount to, permission has to be obtained from the Government to “suspend the Bank Act,” in order to allow the demand to be met, whatever the amount of specie in its “issue department” may be. Three times since the passing of the Bank Act—during the crises of 1847, 1857, and 1866—authority has been given for its suspension. On one of these dates, in 1857, the powers of the Act had to be exceeded; on the other two occasions, the fact that the permission had been given stayed the alarm. It should be remembered, whenever the Act of 1844 is criticized, that since it came into force there has been no anxiety as to payment in specie of the note circulation; but the division of the specie held into two parts is an arrangement which is not without disadvantages. It appears to increase the liability to constant fluctuations in the rate of discount which is one main characteristic of the English money market. Between 1822 and 1844 a rise in the Bank rate above 4 per cent. was rare; 5 per cent. was occasionally charged, and 6 per cent. on 1st August 1839. Of late years the changes in the Bank rate have been constant, and the fluctuations, even in ordinary years, very severe. Thus in 1899 the rate was 4 per cent. on 9th May, and 7 per cent. on 19th December. From the day when the Act came into operation in 1844 to the close of the year 1900 there had been 400 changes in the rate. The other hopes which Sir R. Peel expressed in 1844, such as that after the Act came into force commercial crises would cease, have not been realized. There has been frequent discussion among bankers and occasionally with the Government as to the advantage it might be to grant the Bank of England an automatic power to augment the note issue on securities when required—similar to that possessed by the Bank of Germany (*q.v.*) One of the hindrances to the success of the plan has been that hitherto the Government, acting on the advice of the Treasury, has required an extremely high rate of interest, of which it would reap the advantage, to be paid on the advances made under these conditions. The object of the arrangement of the Bank of Germany is

to prevent panic, hence only a rate of 5 per cent. has been generally charged, though in 1899 the rate was 7 per cent. for a short time. The proposal made by Mr Lowe (afterwards Lord Sherbrooke) in 1873 was to charge 12 per cent., a rate which presupposes panic. Hence the negotiations came to nothing. The Act of 1844 remains unaltered. The issue on securities, allowed by it to the Bank of England, was originally £14,000,000. This has since been increased under the provisions of the Act to £17,775,000 (3rd March 1900). Hence the notes issued by the Bank have less gold by £3,775,000 behind them than previously. Clause 3 of the Act of 1844 allowed silver to form part of the specie to be held against the issue to an extent “not exceeding one-fourth part of the gold coin and bullion” held, and it will be observed that £1,694,087 in “silver bullion” was held in the issue department—first return, 7th September 1844. This had been increased to £2,727,001 by the 3rd October 1846. After that date the amounts declined till 20th August 1853, when the last entry disappeared from the accounts of the bank.

The Bank of England had no branches before 1826. It has now offices at Birmingham, Bristol, Hull, Leeds, Liverpool, Manchester, Newcastle, Plymouth, Portsmouth, Western London (1 Burlington Gardens), Law Courts Branch (London, W.C.). Originally, besides the Bank of England, nearly all the provincial banks in England and Wales possessed the privilege of issue. By the Act of 1844, the maximum circulation of the English issuing banks was fixed at the average circulation of the twelve weeks before 27th April 1844.

The numbers were fixed at:

207 Private banks with an authorized issue of	£5,153,417
72 Joint stock banks with an authorized issue of	3,478,230
	<u>£8,631,647</u>

and the actual circulation of the country in October 1844 was as follows:—

Notes in Circulation.—The monthly return of the circulation ending 12th October 1844 (Stamps and Taxes, 25th October).

<i>England.</i>	
Private banks	£4,674,162
Joint stock banks	3,831,516
<i>Scotland.</i>	
Chartered, private and joint stock banks	2,987,665
<i>Ireland.</i>	
Bank of Ireland	3,597,850
Private and joint stock banks	2,456,261
Total	<u>£17,047,454</u>

In January 1901 the number and amounts were reduced to:—

	Authorized issue.	Actual issue.
33 Private banks	£1,220,588	£344,760
27 Joint stock banks	1,541,735	825,009

The issues have gradually diminished under the provisions of the Act of 1844, designed, as mentioned before, to concentrate the note issue of England and Wales on the Bank of England.

The yearly average of notes in circulation of the Bank of England, of the banks of issue in England and Wales, and in Scotland and Ireland, and also bullion at the Bank of England was as follows:—

<i>England and Wales.</i>				
	Bank of England.	Bullion in Bank.	Private Banks.	Joint Stock Banks.
1844	£21,030,000	£15,567,000	£4,880,000	£3,483,000
<i>Scotland and Ireland.</i>				
	Banks in Scotland.	Bank of Ireland.	Irish Banks.	Total Great Britain and Ireland.
1844	£3,026,000	£3,523,000	£2,205,000	£88,147,000

We may compare this amount with the circulation, January 1901:—

Bank of England	£29,795,599
Private banks	344,760
Joint stock banks	825,009
Total in England	£30,965,368
Scotland	8,565,743
Ireland	7,288,360
United Kingdom	£46,819,471

—an apparent increase of £8,800,000 since 1844. The decrease of the country circulation in England and the increase of the Scottish and Irish circulations may be set off against each other. The increase is practically in the notes of the Bank of England; in 1901 about £8,800,000 more than at the earlier date. It is probable that a large part of this amount is held in the reserves of the banks in England and Wales, and that the active note circulation of the United Kingdom is but little larger now than half-a-century since.

The Government received from the note circulation in 1897, the latest statement to hand:—Bank of England, out of the profits of the issue, £175,065, 10s.; composition for duties on bills and notes, &c., £123,211, 9s. 3d.; and a small sum for bankers' licenses not exceeding £2500 a year.

With respect to the other banks in England, the London banks first claim our attention. In 1844 there were 49 banks in London, 26 connected with the Clearing House. At that time only private banks were allowed to be members. Gradually the joint stock banks made their way into that body, and in 1901 the numbers were 3 private banks and 16 joint stock banks who joined in the clearing,—19 banks in all. The diminution in the numbers of the banks has been mainly the result of amalgamations. In London, Child's Bank and Hoare's of

Other Banks. Fleet Street, and among the provincial banks, Smith's of Nottingham, claim an antiquity greater than that of the Bank of England, the last claiming to have been founded in 1688. The old Bank of Bristol (Bailey, Cave and Co.) was founded in 1750. The business still exists amalgamated with Prescott and Co. Limited, of London. The Hull Old Bank (Pease and Co.) dated from 1754. This business also still continues (amalgamated, 1894, with the York Union Banking Co. Limited). The banks of Gurney and Co., in the eastern counties principally, established more than a century since, have with numerous other banks of similar standing amalgamated with the firm of Barclay and Co. Limited, of Lombard Street. Of recent years amalgamation has been active among English banks. The banks in England and Wales are believed to have been 350 in number in 1792. Those registered from 1826 to 1842 were:—

	Private.	Joint Stock.
1826	554	—
1827	465	6
1833	416	35
1842	311	118

The effect of the panic of 1826 is shown by the reduced number in 1827. Since that date the diminution in the number of the banks has gone on regularly. At the present time the banking business of England is carried on practically by 22 private and 103 joint stock banks, some of which are more properly private firms under joint stock forms of organization. Though the number of banks has diminished the offices have increased greatly. In 1858 there were 2008 in the United Kingdom. In 1900 there were 6521, divided as follows:—

England and Wales	4741
Isle of Man	21
Scotland	1081
Ireland	678
	<u>6521</u>

In Scotland and Ireland a different form of organization from that in use in England has long prevailed. The private form of partnership in both countries gradually died out during the 19th century, and all existing banks there are now organized as joint stocks. The earliest was the Bank of Scotland in 1695. There are in Scotland at the present time 10 banks. All these banks possess the right of issuing notes. They are permitted by the Act of 1844 to issue £2,676,350 without any restriction on what was to be held against the notes in circulation and to any extent beyond on the deposit of bullion. The return of 17th March 1900 showed £7,286,709 circulation and £5,834,104 bullion held. In Ireland a very similar state of matters exists. The earliest bank was the Bank of Ireland, founded 1783. The same clause as in the case of the Bank of England, limiting the partners of any other bank to six, was inserted in the Act to the great disadvantage of Irish banking. This restriction was afterwards rescinded. At present six banks are allowed to issue £6,354,494 against securities and anything further that is required on bullion. On 17th March 1900 the return was £6,651,392 circulation and £3,200,385 bullion held.

Though the note circulation is the feature in banking which attracts most attention from those unacquainted with the real working of the business, it is virtually a trivial detail in comparison with the deposits. It is, unfortunately, impossible to give any trustworthy statistics of the position of banking in the United Kingdom extending back for any considerable time. It is only of recent years that any statement of these other than an estimate has been possible owing to the long-continued reluctance of banks to allow any publication of their balance sheets. A paper by the late Mr Newmarch, printed in the journal of the Statistical Society for 1851, supplies a basis for an estimate. According to this the total amount of deposits, including the Bank of England, in England and Wales, Scotland and Ireland, may have been at that date, from £250,000,000 to £360,000,000. The estimate in Palgrave's *Notes on Banking*, 1872, excluding deposits in discount houses and the capitals of the banks, was from £430,000,000 to £450,000,000. The corresponding amounts at the close of 1900 were, in round figures, including acceptances, etc., £920,000,000. The total resources, including capitals and reserves (in round figures, £130,000,000) and note circulation, were for 1900:—

Banks in England and Wales (including	
Bank of England)	£844,259,000
Scotland	137,182,000
Ireland	67,988,000
Isle of Man	1,001,000
	<u>£1,050,430,000</u>

The progressive growth in bank deposits since it has been possible to keep a record of their amounts, affords some means for checking roughly the correctness of the estimates of 1851 and 1872. Broadly speaking, it may be said that the bank deposits of the United Kingdom have doubled since the latter date.

Practically at the present time every large transaction in the United Kingdom is settled by cheque, that is, by a series of ledger transfers, notes and specie being but the small change by which fractional amounts are settled. A large proportion of these are arranged through the operation of the London Clearing House. This is facilitated by

the fact that every bank in the United Kingdom has an agent in London. If we add to the returns of the London Clearing House those of the Clearing Houses in the large towns of England, in Ireland and Scotland, and the numerous exchanges which occur daily, and the large number which the different offices of banks with a great many branches settle among themselves and the number drawn by one customer of a bank and paid to

Turnover. another, we may form some notion of the vast amount of the yearly turnover of banks. This may roughly be estimated in all as at least twice as great as that registered by the London Clearing House. The earliest authentic statement as to the clearing is found in the *Appendix to Second Report, Committee of House of Commons, Banks of Issue, 1841* :—

In 1839, the clearings were	£954,401,600,	29 banks.
In 1840, " " "	978,496,800,	28 banks.
In 1899, " " "	9,150,269,000,	19 banks.
In 1900, " " "	8,960,170,000,	19 banks.

Estimates have been made of the amount of business turnover which does not pass through the London Clearing House. This would include the large number of cheques drawn by one customer of a bank in favour of another customer of the same bank; of exchanges between banks in the same place; of the sums passed in the same way through the Clearing Houses in the larger cities, as Manchester, Birmingham, Liverpool, and other places in Scotland and in Ireland; and cheques paid in different manners. It is believed that these amounts may fully equal the sums paid through the London bankers' clearings. The increase in the clearings is striking; but it is on the deposits that attention must be fixed. The deposits are the mainstay of the banking of the United Kingdom. On the way they are employed and on their fluidity the prosperity of the country greatly depends. By the assistance they give, all the new business of the country has to be established as well as all the old business maintained.

In the year 1901 the most important requirement of banking in the United Kingdom was still the establishment of an efficient specie reserve. The reserve in the banking department of the Bank of England, which averaged £21,455,000 in 1900, £21,000,000 in 1899, £22,000,000 in 1898, provides but a narrow basis for the whole business requirements of the country. Though it is much larger than the reserve kept before 1893, which had for several years been completely inadequate, it cannot yet be considered sufficient. The gold held was actually less towards the close of 1900 than at the corresponding date in 1876. The figures were :—

1st November 1876	£32,190,735
7th November 1900	29,968,945

Beyond this there is the cash held by the other banks. Part of this is held in the form of balances at the Bank of England, and in notes of the Bank of England, and hence is not unlikely to be estimated twice over unless care is taken to separate these sums from the specie actually in the hands of other banks. The published figures on this point are meagre. Private inquiries, however, lead to the belief that an amount of about 10 per cent. of the deposits may be held in balances at the Bank of England, in specie and Bank of England notes. This would amount, if this belief is correct, to a sum of not less than £80,000,000. The subject is of such importance that it is to be hoped that authoritative figures will before long be published.

As regards the banks in which British interests are concerned in British colonies and other countries we can only speak briefly. It must not be overlooked that in the Dominion of Canada there are 14 large banks, managed much on the Scottish principle with capitals

of over £15,000,000 and deposits of nearly £55,000,000. These banks have 431 offices. In Australia and New Zealand there are 18 banks with capitals of fully £25,000,000 and deposits of about £114,000,000. The number of offices is more than 1400. There are, including the 3 Presidency Banks, about 7 banks doing business mainly in India—in some cases connecting neighbouring countries and places like Bangkok, Hong Kong and Zanzibar. These banks have capitals of about £6,000,000 and deposits of £30,000,000 and 43 offices. There are at least 4 banks in South Africa with capitals of £4,380,000, deposits of £23,000,000, and 163 offices. There are 7 banks, principally in South America, with £6,410,000 capital, £37,000,000 deposits, and 56 offices. There are 4 large banks doing business principally in the East with more than £11,000,000 capital, £48,000,000 deposits, and 73 offices; and two other large banks, Barings and the Colonial Bank, with nearly £2,000,000 capital, £37,000,000 deposits,—the latter with 21 offices, doing business mainly with North and South America.

In this statement we have only included the larger banks. These collectively wield about £70,000,000 of capital and more than £340,000,000 of deposits—in all more than £410,000,000 of resources operating at nearly 2200 different places as widely separated from each other in distance as California and Hong Kong, Constantinople and New Zealand. The resources of these banks, which are principally British in origin, may, though the districts in which they operate are generally far distant from the United Kingdom, be considered as supplementary to English banking.

France.

In France the first bank of issue was established in 1716 by John Law, the author of the *Mississippi Plan* and the *System*. Law's bank came to an end in 1721; an attempt at reconstruction was made in 1767, but the bank thus established was suppressed in 1793. Other banks, some issuing notes, then carried on operations with limited success, but these never attained any real strength. There were many negotiations on the subject of the establishment of a bank in 1796. The financial difficulties of the times prevented any immediate result, but the advice of those engaged in this plan was of great assistance to Napoleon I., who, aided by his minister Mollien, founded in 1800 the Bank of France, by far the most powerful financial institution in the country, to support the trade and industry of France and to supply the use of loanable capital at a moderate charge. These functions it has exercised ever since with great vigour, extending itself through its branches and towns attached to branches over the whole country. At its establishment the operations of the bank did not extend over the whole of France. Departmental banks, with the privilege of issue, had been formed under a law adopted in 1803. At the close of 1847 there were nine of these banks existing in as many of the larger towns. In 1848, however, they were absorbed into the Bank of France, which has since possessed an exclusive privilege of issue, and in 1863 took over the Bank of Savoy after that province was united to France. The Bank of France has successfully surmounted many political as well as financial troubles both during and since the times of Napoleon I. The overthrow of the government of Louis Philippe in 1848, the war with Germany in 1870, the many difficulties that followed when the Commune reigned in Paris in 1871, the payment of the war indemnity—completed in 1873—were all happily surmounted. Great pains, too, have been taken, especially of recent

Bank of France.

years, to render services to large and small businesses and to agricultural industry. In 1877 the offices of the Bank of France were 78 in number; in 1900 they were 392, including the towns "connected with the branches,"—an arrangement which, without causing the bank the expense of opening a branch, gives the place connected many of the advantages which a branch confers. The commercial paper discounted has largely increased, and in 1900 amounted to £489,902,000. The advances on securities were in the same year £66,000,000. The rate of discount in Paris is, as a rule, lower than in London, and the number of alterations in it fewer. Bills as low as 4s. 2d. are admitted to discount, and since 27th March 1890, loans of as small an amount as £10 are granted. In most cases three "names" must be furnished for each bill, or suitable guarantees or security given, but these necessary safeguards have not to be furnished in such a manner as to hamper applicants for loans unduly. In this manner the Bank of France is of great service to the industry of the country. It has never succeeded, however, in attracting deposits on anything like the scale of the Bank of England or the banks of the English-speaking peoples, but it holds about £25,000,000 in deposits, and operates through its enormous note circulation (averaging in 1900 £161,400,000), by means of which most business transactions in France are carried on.

The limits of the circulation of the Bank of France and the dates when it has been extended are as follows:—

Dates.	Millions of Francs.	Converting the Franc as 25=£1.
15th March 1848	350	£14,000,000
27th April, 2nd May 1848	452	18,000,000
2nd December 1849	525	21,000,000
12th August 1870	1,800	32,000,000
14th August 1870	2,400	96,000,000
29th December 1871	2,800	112,000,000
15th July 1872	3,200	128,000,000
30th January 1884	3,500	140,000,000
25th January 1893	4,000	160,000,000

The extension of the circulation of the Bank of France, now ten times as large as half-a-century since, is a sufficient proof of the assistance afforded by that institution to the business of the country.

Most business transactions in France are liquidated in notes of the Bank of France. These, owing to their convenience, are preferred to specie. This is accumulated in the vaults of the Bank of France, which in 1900 held £93,372,000 gold, and £44,000,000 silver. The gold held by the Bank of France is generally considerably larger in amount than that held by the Bank of England, which in the autumn of 1890 had to borrow £3,000,000 in gold from the Bank of France at the time of the Baring crisis. The large specie reserve of the bank has given stability to the trade of France, and has enabled the bank to manage its business without the numerous fluctuations in the rate of discount which are constantly occurring in England. The mass of the reserve in France is so great that the movements of the precious metals, when they are the result only of natural causes, are allowed to go on without corresponding movements in the discount rate. But it must be remembered that this large reserve is held in part against a gigantic note issue, and also that the trade activity and enterprise of the French people are less intense than in the United Kingdom or Germany, so that it is much easier for the Bank of France to maintain a steady rate of discount.

Besides the Bank of France, several great credit institutions carry on business, as the Crédit Lyonnais, the Comptoir National d'Escompte de Paris, the Société Générale pour favoriser le développement du Commerce et de l'Industrie en France, and the Société Générale de Crédit Industriel et Commercial. Their principal figures are as follows:—

	Capital and Reserve.	Other Liabilities, Deposits, &c.	Branches.
Comptoir National d'Escompte de Paris	£4,000,000	£21,000,000	{ 122 offices. 80 in France.
Crédit Lyonnais	10,400,000	46,000,000	{ 173
Société Générale pour favoriser le développement du Commerce et de l'Industrie en France	2,950,000	22,000,400	{ 282 55 in France.
Société Générale de Crédit In- dustriel et Commercial	880,000	4,690,000	{ 18

There is also the Crédit Foncier de France with a capital of nearly £13,500,000, but the business done is so largely that of mortgages that it can hardly be included among banks, though it carries on in some measure the business of banking.

Besides the four large joint stock banks mentioned above, there exist in France a very large number of country banks carrying on a very considerable business. Little is known as to their deposits, but their business appears to be conducted with great prudence and discretion. One hundred and eighty-two of these were members of the French Country Bankers' Association in 1898. They carry on business in 66 out of the 86 Departments. More than one of these banks has several offices—one possessing 18, including the head office. These branches are situated in the small towns in the vicinity. In this the business follows more the English method of small branches. The French Country Bankers' Association holds its meetings in Paris, where matters of interest to bankers are discussed. (See *Bankers' Magazine*, July 1898.)

The business of banking in France is carried on with great regularity and vigour. Little, comparatively, is heard of it in a general way beyond the boundaries of the country, but within those limits it exerts a very useful influence on the development of industrial progress and of agriculture.

Germany.

There are, together with the Reichsbank, to which reference will be made more particularly later, about 140 banks doing business in the states which form the German empire. These credit and industrial banks with their large resources have had an immense influence in bringing about the astonishing industrial development of the country. Six of these banks possess the right of uncovered note issue; these are—

Bank of Frankfurt, with right of issue	£500,000
Bank of Saxony, "	838,550
Bank of Bavaria, "	1,600,000
Bank of Wurtemberg, "	500,000
Bank of Baden, "	500,000
Bank of South Germany, "	500,000
	<u>£4,438,550</u>

Besides these there are (to name only some of the more important of the credit and industrial banks) the following:—

Deutsche Bank (capital and reserve, deposits and acceptances)	£32,000,000
Disconto-Gesellschaft (capital and reserve, deposits and acceptances)	20,000,000
Dresdner Bank (capital and reserve, deposits and acceptances)	23,000,000
Bayerische Handelsbank (capital and reserve, deposits and acceptances)	9,000,000
Bergisch Märkische Bank (capital and reserve, deposits and acceptances)	6,000,000
Berliner Handels-Gesellschaft (capital and reserve, deposits and acceptances)	11,000,000
National Bank für Deutschland (capital and reserve, deposits and acceptances)	8,000,000

The capital and reserves* of all these larger German banks, including those of the Bank of Germany, are fully

£130,000,000. This amount compares very closely with the amount of the capital of the banks of the United Kingdom, but the deposits do not bear in the least any close proportion to those held by the English banks. The deposits, however, are not the whole of the resources of the German banks. The banks make use, besides, of their acceptances in a manner which is not practised by the banks of other countries, and the average note circulation of the Reichsbank alone is between £50,000,000 and £60,000,000. The circulation of the other note-issuing banks does not appear to be up to the limit allowed.

A large proportion of the resources of the German banks is employed in industrial concerns, some of which are beyond the boundaries of the empire. The dangers of this practice have called forth many criticisms in Germany, among which we may quote the remarks of Mr Cæsar Strauss and of Dr R. Koch, the president of the Reichsbank. Dr Koch especially points out the need of the increase of powerful banks in Germany unconnected with speculative business of this kind. The object of employing their funds thus is the higher rate of interest to be obtained from these investments than from discounting bills or making loans at home. But such an employment of the resources of a bank is opposed to all regular rules of business and of banking tradition, which abstains from fixed investments of any large part of the resources of a bank. On the other hand, Dr Koch observes that the risks of the one "reserve system" mentioned by Bagehot are not to be feared in Germany.¹

There are, besides the banks we have referred to, many private banking firms in Germany which do a considerable amount of business.

The Imperial Bank (Reichsbank), which is by far the most powerful banking institution in Germany, is managed

by the Bank Directory appointed by the Chancellor of the empire. The shareholders join in the management through a committee, of which each member must be qualified by holding not less than three shares. The government exercises complete powers of control through the Chancellor of the empire. The influence of the Imperial Bank now permeates by means of its branches all the separate kingdoms of the empire—the uniformity of coinage introduced through the laws of 1871-73 rendering this possible. The Imperial Bank assists business principally in two ways. First through the clearing system (*Giro-Verkehr*), which it has greatly developed, and secondly through the facilities given to business by its note circulation. The Imperial Bank also receives deposits, and cheques are drawn against these, but in Germany notes are principally used in payments for ordinary business. Before the Reichsbank was established, Hamburg was the first, and for a long time the only example of a clearing in Germany. This was taken up by the Reichsbank when it established its office in Hamburg in the time-honoured building which had belonged to the Hamburg Clearing House. Similar business had long been undertaken by the Bank of Prussia. This was absorbed and developed by the Reichsbank in 1876. Through the "clearing system" money can be remitted from any of the 311 places in which there is an office of the Reichsbank, to any other of these places, without charge either to the sender or the receiver. It is sufficient that the person to whom the money is to be remitted should have an account at the bank. Any person owing him money in the remotest parts of the empire may go to the office of the bank which is most convenient to him

and pay in the amount of his debt, which is immediately remitted, without charge, to the account of his creditor wherever he may reside. The impetus given to business by this arrangement has been very considerable. It practically amounts to a money-order system without charge or risk of loss in transmission. From Hamburg and Bremen to the frontiers of Russia, from the shores of the Baltic to the frontiers of Switzerland, Germany, for monetary purposes, is thus only one country. The note circulation is also a powerful factor of the business of the Reichsbank. It is governed by the law of 1875 and the amending law of 1899, corresponding in some degree to Peel's Act of 1844, which regulates the note circulation of the Bank of England. An uncovered limit, originally £12,500,000, increased to £14,811,450 by the lapse of the issues of other banks allowed to it, has been extended by the Act of 1899 to £22,500,000. Against the notes thus issued which are not represented by specie, treasury notes (*Reichskassenscheine*, the legal tender notes of the empire²), and notes of the other issuing banks which are allowed to be reckoned as specie, or discounted bills, must be held—maturing not later than three months after being taken—with, as a rule, three, but never less than two, good endorsements. There is also a provision that at least one-third of the notes in circulation must be covered by current German money, notes of the imperial treasury, and gold in bullion or foreign coin reckoned at £69, 12s. per pound fine. The Reichsbank is bound by law to redeem its notes in current German money. It is stated that this may be gold coin or silver thalers, or in bar gold at the rate of 1392 marks (£69, 12s., reckoning marks as 20 = £1)—the pound fine of gold. In practice, however, facilities are not always given by the Reichsbank for the payment of its obligations in gold, though the importance of this is admitted. In the balance sheet for 1899 the bills held amounted to £54,000,000, and the loans and advances to £8,500,000. The notes issued averaged for the year £57,000,000. The gold held amounted, 31st December 1899, to £23,450,000. If the condition of business requires that the notes in circulation should exceed the limits allowed by the law, the bank is permitted to do this on the payment of 5 per cent. on the surplus. In this respect the German Act differs from the English Act, which allows no such automatic statutory power of overpassing the limit of issue. Some good authorities consider that this arrangement is an advantage for the German bank, but recent experience makes it doubtful whether the system may not tend to encourage reckless speculation. Of late years the excess of issue of the Reichsbank has been annual and has become large—more than £6,800,000, on average, in 1899. It remains to be seen whether the increase of the uncovered limit will be sufficient to obviate the need for an excess of issue beyond the limit for the future.

The amendment to the banking law of Germany, passed in 1899, not only affects the position of the Reichsbank, but that of the six other note-issuing banks. The Bill of 1899 directed an increase of the capital of the Reichsbank, then £6,000,000, up to £9,000,000. Of the £3,000,000 new capital, half is to be emitted prior to 31st December 1901 and the other half before 31st December 1905. The reserve fund, then £1,500,000, is to be raised gradually out of surplus profits to a maximum of £3,000,000. The amending Act further diminishes the dividend receivable by the stock-holders of the Reichsbank

¹ *Vorträge und Aufsätze hauptsächlich aus dem Handels- und Wechselrecht*, von Dr R. Koch, pp. 163-4.

² The imperial treasury is bound to pay the State notes in cash at any time when this is required, but an independent fund of cash set apart for this purpose does not exist. *Handwörterbuch der Staatswissenschaften*, vol. v., art. "Papiergeld," p. 97, ed. 1893. Jena: Conrad and Elster, Lexis and Loening.

and increases the share which the Government will obtain. The untaxed limit of issue (note reserve, as termed in Germany) is increased, as mentioned above, from M.293,400,000 (£14,670,000) to M.450,000,000 (£22,500,000). The arrangement with the six note-issuing banks is designed to cause them to work in harmony with the Reichsbank, when the Reichsbank has to raise its rate in order to protect its gold reserve. The official published rate of discount of the Reichsbank is to be binding on the private note-issuing banks after it has reached or when it exceeds 4 per cent. At other times they are not to discount at more than a quarter per cent. below the official rate of the Reichsbank, or in case the Reichsbank itself discounts at a lower rate than the official rate, at more than one-eighth per cent. below that rate. If the Reichsbank discounts below the official rate, it is to announce that fact in the *Gazette*.

The subject being important, we quote from the amending Act the sections governing the discount rate:—Gesetz, betreffend die Abänderung des bank-gesetzes vom 14 März 1875; vom 7 Juni 1899, Artikel 7, § 1. The private note-issuing banks are bound by artikel 7, § 2, after the 1st January 1901—" (1) Not to discount below the rate published in § 15 of the bank law, so long as this rate attains or exceeds 4 per cent.; and (2) moreover, not to discount at more than a quarter per cent. below the Reichsbank rate, published in § 15 of the bank law, or in case the Reichsbank itself discounts at a lower rate, not to discount at more than one-eighth per cent. below that rate."

It remains to be seen whether the note-issuing banks will find these conditions too onerous, and will give up their right of issuing notes rather than be bound by them. The object of the enactment is apparently to protect the specie reserve of the Reichsbank, but it may be doubted whether, considering the importance of the other banks of Germany—none of which are bound by similar conditions—relatively to the note-issuing banks, the restrictions put on the note-issuing banks will have any practical effect.

Since 1870 banking has made immense progress in Germany, but it will probably be some time before the system of making payments by cheque instead of specie or notes becomes general.

United States.

The "National Bank Act" of 1864, as amended, has been modified by the Act of March 1900. Originally designed to force a market for U.S. bonds during a time of civil strife and to provide for the issue of national currency, the Act of 1864 has created a great commercial institution, whose distinctive features are: implied responsibility of the U.S. Government for the safety of the notes of the banks; reports made five times each year to the Comptroller of the Currency as to condition on days previous to the date of his call therefor; verification of each bank's assets and liabilities by experienced Government examiners; and a compulsory cash reserve for each national bank, in large cities equal to 25 per cent. of the amount of its deposits. In the smaller cities this reserve is 15 per cent. of that liability, three-

fifths of which may be deposited with banks in the larger cities as approved by the Comptroller of the Currency. Banks or associations may own their banking houses but no other real estate, unless taken for debt, and then only for five years. Interest rates are charged according to state laws. Dividends may not be paid to stockholders unless one-tenth of the profits is set aside as surplus, though such surplus need not exceed 20 per cent. of the capital stock. Notes of a bank, secured by a deposit at Washington of U.S. bonds, are receivable in payment of taxes, excises, public lands, and all other debts except custom duties. The average circulation of each bank or association is subject to a tax, and a fund amounting to 5 per cent. of such circulation is deposited at the Treasury by each bank for the purpose of redeeming mutilated notes. In addition to a possible loss of the money invested in the shares of national banks, stockholders are personally liable for the debts of such banks to the amounts of their respective holdings at par.

By 1873 the National Banks' circulation had amounted to \$341,320,256. Because of the swollen volume of the country's paper currency, gold had remained out of circulation, the premium working slowly down from the enormous war price of \$258 of paper money for \$100 of gold in July 1864, to a rate of only 15 per cent. premium in the same month of 1873. During the panic of 1873 the circulating notes of the banks held good and were redeemed. With the "hard times" clamour for more currency, and with the constant outflow of exported gold, the Government's legal tender obligations could not be met in that coin. In preparation for the resumption of specie payments, 1st January 1879, the Government sold bonds, depositing large sums in the New York banks. Under the Bland Bill of 1877 the Government coined monthly 2,000,000 to 4,000,000 silver dollars—worth, internationally, about 90 cents in gold each. The New York Sub-Treasury was admitted to membership in the Clearing House in 1878, and in the same year the Clearing House rule was adopted, prohibiting payments of balances between members in silver except in small sums. In New York and Boston it was agreed that deposit accounts kept in terms of gold should be abolished. Arrangements were made for the maintenance of 40 per cent. of the outstanding U.S. notes to be held by the Treasury in gold. By the aid of the banks, which agreed not to demand payment of their legal tender notes in gold from the New York Sub-Treasury, a gold standard of value was established in 1879.

The regular increase in the volume of money under the Bland Law, and the inability of the U.S. Treasury to get rid of its accumulating stock of silver through the banks, led Congress, in 1882, to stipulate that no national banking association should be a member of any Clearing House in which silver certificates should not be received in settlement of balances; but the banks were only striving to resist the conversion of their banking reserve from gold into silver. Meanwhile, under the stimulus of agricultural and business prosperity, speculation had gone beyond bounds, producing in 1884 a panic, mainly confined to New York financial circles. Several important failures occurred in Wall Street, including the Marine and Metropolitan Banks, though the banks in general well sustained the burden of credits. On 1st October 1881 the circulation of all the national banks amounted to \$320,000,000. In July 1882 the Government funded its outstanding 5 per cent. war bonds by an issue of 3 per cents. As considerably more than half the bank holdings were of the class converted, and as the Government policy of reducing interest also led to the retirement of bonds by the aid of its now steadily-growing revenue surplus, during the next

few years bank-note circulation steadily decreased, until by October 1890 the outstanding notes were reduced to \$122,928,084, the lowest point ever reached. In 1885, because of a diminishing gold reserve, the New York banks on appeal turned over to the U.S. Treasury nearly \$6,000,000 gold, in return for fractional silver coin. During these years other forms of currency than the bank notes increased in volume. In 1890 the Treasury legal tender notes, and the form of Government obligation known as silver certificates, together aggregated \$620,000,000. Until this time the Government's gold reserve had been constantly maintained since 1879 at above \$100,000,000, and the arrangement with the banks for them to redeem in gold the notes turned in by the public while exchanging gold at the Sub-Treasury for the same notes had been carried out. In 1890 a law was passed which obliged the U.S. Treasury to purchase 4,500,000 ounces of silver monthly, and to pay for the same in U.S. notes, which should be redeemed in gold or silver coin. In 1891 the gold reserve fell below \$100,000,000.

The years between 1885 and 1893 were years of activity and business prosperity, supported by abundant harvests marketed at high prices. A reaction was the result, and by 1893 a memorable panic had set in. Frightened depositors withdrew their money from banks in the west, while increased demands for loans came upon the banks east and west alike. The western banks withdrew from the reserve cities the funds which they had left with the reserve banks, in order to secure the 2 per cent. interest allowed on such deposits, with the result of decreasing the cash reserve in New York city alone over \$41,000,000 in the space of two months, bringing these reserves, as was usually the case in times of panic, below the 25 per cent. required by law. Large railroad and industrial suspensions resulted, yet, as heretofore, the banks were able to meet all emergencies because of their inherent soundness. In that year the New York banks turned over to the Treasury more than \$6,000,000 in gold in exchange for U.S. notes. During this panic a plan was again successfully employed, which had been tried in the panic of 1873 and again in 1884 and 1890, namely, the issue by the New York Clearing House of loan certificates, having as the basis of their value securities and sound commercial paper of the banks deposited with the Clearing House to an amount 25 per cent. above the par of the certificates. These Clearing House certificates passed between the banks in lieu of cash settlement for Clearing House balances. The example of New York was followed by the Clearing Houses of Boston, Philadelphia, Baltimore, and Pittsburgh. No very important National Bank failures resulted, although upwards of 150 banks out of an aggregate of 3800 suspended during the year, all but five being in the west and south; nearly 400 state and savings banks and private bankers, however, came to grief. Finally, the New York banks, by means of increased Clearing House certificates, arranged to import several millions of gold.

Because of a scarcity of currency, depositors had been compelled to accept certified cheques instead of money for all purposes except the most urgent needs. Both gold and paper money commanded a premium of 4 per cent. over bank cheques, and gold was attracted from abroad and from being hoarded to realize the profit. In February 1894 the banks subscribed for 80 per cent. of a new issue of Government bonds. In August of the same year, on appeal from the U.S. Treasury, they again exchanged \$15,000,000 of gold for U.S. notes called legal tenders. In November the banks again subscribed for a further issue of Government bonds. In January 1895 a syndicate

of international banks and bankers subscribed for another issue of Government bonds, with the condition that the syndicate would protect the Treasury against the withdrawal of gold for export purposes. These operations, extending through the years 1895 and 1896, together with the check given to the increasing amount of silver by the repeal in 1893 of the Silver Purchase Law of 1890, had the effect of restoring public confidence in the Government's ability to redeem its obligations in gold at any time. Since 1895 banking has not experienced startling changes, bearing up well under the Venezuelan difficulties of that year, the outbreak of the Spanish war in 1898, and the flurry in the money market in December 1899.

Some tendencies have shown themselves. Following other lines of business, consolidation of banks has increased as bankers have become impressed with the advisability of having larger financial institutions. In the same way many banks have increased their capital, so that larger amounts could be lent at one time, and that larger depositors might be attracted by the added security. In April 1899 the New York banks, acting through the Clearing House, agreed upon a schedule of charges for the collection of out-of-town cheques deposited with them in the course of business, such cheques having been collected gratis. The custom has been growing of requiring statements of financial condition from merchants and corporations when asking for loans or offering for sale single-name commercial paper. The formation of the large industrial companies has tended to take from the banks the smaller loans made heretofore to the individual concerns absorbed, and to substitute the lending of large sums to the industrial combinations themselves, the latter plan involving more of the principles of corporation financing.

In March 1900 certain of the provisions of the National Banking Act were amended as follows:—The ratio of population to capital of new banks in places of less than 3000, to be \$25,000; in places of not more than 6000, not less than \$100,000.

National Banks.

Old and new banks to be allowed circulation up to the full par of bond deposited with the Treasury, while such bonds shall remain at or above par in the market. Not more than one-third of each bank's circulation to be in denomination of five dollars. Each bank to be permitted to obtain circulation on deposit of new 2 per cent. bonds authorized under the same Act. The average circulation to be taxed $\frac{1}{4}$ per cent. each half-year. The bonds thus authorized were designed to refund former issues at higher rates, and from the first, large exchanges of the new bonds were effected, the latter being much esteemed as a basis for national bank circulation, particularly as touching newly-organized banks in small towns and cities. On 13th February 1900, the national banks of the U.S. numbered 3604; their total assets were \$4,674,910,713, inclusive of about 550 millions of dollars due to and from the banks themselves. Among their assets were the following, in millions of dollars:—loans and discounts, 2481; U.S. bonds for circulation, 236; stocks, securities, &c., 330; banking houses, 79; other real estate and mortgages owned, 28; specie, 339; legal tender notes, 122. Among the liabilities were, also in millions of dollars:—capital stock paid in, 613; surplus and undivided profits, 363; circulating notes, 204; due to state banks and bankers, 318; individual deposits, 2481; U.S. deposits, 103. Of the above assets New York city banks comprised \$1,107,000,000, including loans and discounts of 499 millions; their capital stock was 56 millions; their surplus and undivided profits, 68 millions; their circulation outstanding, 17 millions; their individual deposits, 475 millions. The National City Bank of New York, the largest bank in the U.S., had a capital of 10

million dollars paid in, and assets of 168 millions; while the Chemical National Bank, also of New York, had 38 millions of assets, at the same time reporting a capital stock of \$300,000, with a surplus of undivided profits of \$6,697,000, or over 22 times the amount of the original capital, this surplus making it the richest bank of the U.S. in point of book value of capital stock.

From the inception of the National Bank plan, the State banks began to withdraw their circulating notes, a national law having been passed making their notes subject to a prohibitive tax of 10 per cent. on the average annual circulation. By 1873 the aggregate of notes outstanding on account of all the State banks was only about \$200,000, some of them having a few scattered notes in circulation at the present time. The laws in all the forty-four States differ to some extent, but the following chief distinctions from the National Bank plan may be observed, the excellent laws of New York State being taken as fairly representative of the regulations in all the States. A State superintendent of banks is appointed by the Governor for a term of three years. This official exercises a control over the banks, including savings banks and loan and trust companies, similar to that of the National Comptroller of the currency. Reports are rendered to him every half-year; and in New York State, as in most of the other States (Rhode Island being an exception to the general rule), an examination of each bank is made by his department at irregular intervals, but at least once in each year. Loans may not be made to any one person, firm, or corporation in excess of 20 per cent. of a bank's combined capital and surplus. Notes or other evidences of debt shall not be purchased for less than the amount due according to the face of the same. Loans may be made upon mortgages, but except for owning a banking-house, real estate may not be acquired except for debt. A money reserve of 15 per cent. is required in New York city, and of 10 per cent. in other cities in New York State. Stockholders are responsible for the debts of the bank to the extent of the par value of their stock, in addition to the amount invested in such stock. Under the New York law 6 per cent. is the legal rate of interest, but demand loans secured by collaterals may be made at higher rates. Since 1895 it has been lawful in New York State for banks in the same municipality to consolidate, as agreed upon by their respective directors and subject to the approval of the superintendent of banks. This privilege has been utilized in several cases, one large New York city institution, the Corn Exchange bank, having in three years absorbed five smaller State banks. In 1863 the State banks numbered 1466 throughout the United States. Five years later they had decreased to 247; but in subsequent years they grew very rapidly in number, aggregating 620 in 1880, 2101 in 1890, and 4191 in 1899. The assets of these latter aggregated in 1899, \$1,636,000,000, including the following in millions of dollars:—Loans on real estate, 51; other loans, 857; stocks and bonds, 172; due from banks, 255; real estate, 68; cash and cash items, 216. Among their liabilities also in millions of dollars were:—Capital stock, 233; surplus and undivided profits, 113; deposits, 1164; due to banks, 108. The greater proportion of failures on their part, as against failures of National Banks, should be noted. In the six and a half years beginning with the panic year of 1893 and ending 30th June 1899, 283 State banks failed, having assets, according to their books, amounting to \$62,739,332. Of these sums there had been recovered from shareholders \$1,517,178, and from the liquidation of assets \$32,925,233, or about 56 per cent. of the total assets. The total failures of National Banks during thirty-six years, from 1864-99 inclusive, were

only 387. The nominal assets of these National Banks aggregated \$235,636,778. Upon the assets of 375 of these there had been collected on 31st October 1899, either from stockholders or from the liquidation of assets, 73.92 per cent.

There is a large number of private bankers in the United States, particularly in the central-western States. In 1899, 756 of these had total assets of over \$87,000,000, of which about \$14,000,000 represented the investment or other holding of individual capital and about \$65,000,000 depositors' funds.

The New York Clearing House Association, instituted in 1853, is the foremost clearing organization in the United States. The largest banks in the city

Clearing Houses.

send representatives each morning to the clearing building, where all the cheques received on deposit during the previous day by each bank on other Clearing House banks are exchanged. At precisely ten o'clock, on the stroke of the manager's bell, the clerks of the banks begin to pass from desk to desk, delivering packages of cheques to the settling clerk of each bank. The average length of time required for effecting this exchange of cheques is nine minutes, and the cheques are immediately taken away to the banks on which they are drawn. The aggregates of cheques received, as per the footings made by all the settling clerks, is made to balance against the aggregates, previously prepared, of all the cheques which have been brought to the Clearing House. Forty-five minutes usually suffices to ascertain the amount in which each bank has become a debtor or creditor with the Clearing House. Each debtor bank then has until 12.30 o'clock to turn in to the manager of the Clearing House in cash the amount of its debit balance, settlement with creditor banks being made, also in cash, by 1.30 o'clock. Tardiness as well as inaccuracies in listings or footings subjects the banks to fines. During 1900 a single cheque for \$17,000,000 was cleared. In the previous year one bank had a credit balance after making its day's exchanges of \$13,462,379.78. The total clearings of the New York institution during 1899 were \$57,368,230,771. The average daily clearings amounted to \$189,961,029. The total balances for that year between members were \$3,085,971,370, the average each day being \$10,218,448, involving the handling of over 250,000 daily cheques. Similar Clearing House arrangements obtain in 71 other American cities. The total clearings of all these institutions were \$38,526,000,000 in 1879; \$56,175,000,000 in 1889; and \$88,909,671,776 in 1899. The New York Association was, in 1900, composed of 63 banks and the U.S. sub-treasury at New York. Ninety-five banks have been members of the Association since it was organized. The loss in numbers is due to failures, retirements, and consolidations. Of the first 25 members, 19 still remained in 1900. The Association is composed only of National and State banks, but these provide clearing accommodations for 78 other banking institutions, trust companies, which do an individual deposit business, and smaller neighbouring banks. No bank can become a member of the New York Clearing House, or is allowed to clear its cheques through the bank of a member, until its Board of Directors by resolution gives permission to the Clearing House Committee to examine into its financial condition at any time without notice. The Clearing House issues every Saturday a statement showing the condition of all the banks by aggregates, averaged for the week, and giving surplus over required reserve. This statement is regarded as important by financial circles throughout the U.S. as indicating by comparison tendencies in the money market.

(T. L. G.)

II. LAWS AFFECTING BANKS AND THEIR CUSTOMERS.

Apart from the question of the issue of bank notes the modern tendency of legislation and legal decision alike appears to favour the expansion and facilitate the operations of banking. With regard to note issue, the legislation which culminated in the Bank Charter Acts of 1844 and 1845 secured to the Bank of England the absolute monopoly of the note issue within the City of London and a three-miles radius. Outside that radius, and within sixty-five miles of the City, there is a concurrent right in banks, consisting of six or less than six persons, established before 1844, and issuing notes at that date; beyond the sixty-five-miles radius the privilege may be exercised by all banks established before 1844, and then issuing notes, who have not since lost their right to do so by bankruptcy, abandonment of business, or temporary suspension of issue. According to some authorities, the effect of 20 and 21 Vict. cap. 49, sec. 12 was to sanction the increase in the constitution of any bank issuing notes outside the three-miles and within the sixty-five-miles radius from six to ten persons without affecting the power to issue notes. This is the view accepted by Chalmers, Macleod, and Byles; while, on the other hand, Lord Lindley, Grant, Chitty, Douglas Walker, and Cavanagh regard the constitution of such banks as limited to six persons. Consideration of the various statutes appears to support the view of the latter authorities, and the rule as laid down above is believed to be the correct one. The increase in the number of Joint Stock Banks and the gradual absorption of the smaller and older concerns have had the effect of diminishing the output of notes other than those issued by the Bank of England, and, as exemplified by the case of *The Attorney-General v. Birkbeck*, 12 Q. B. D. 57, it would seem impossible to devise any scheme by which the note-issuing power of an absorbed bank could be continued to the new or amalgamated body.

The functions of a bank as what is somewhat incorrectly termed a bank of deposit, as opposed to a bank of issue, are of more everyday importance. The term "bank of deposit" gives a mistaken idea of the real relation between banker and customer. So long ago as 1848 it was decided by the House of Lords in *Foley v. Hill*, 2 H. of L. 28, that the real relation between banker and customer was that of debtor and creditor, not in any sense that of trustee and *cestui que trust*, or depositor and depositor, as had been formerly supposed and contended. The ordinary process by which a man pays money in to his account at his banker's is in law simply lending the money to the banker; it fixes the banker with no fiduciary relation, and he is in no way responsible to the customer for the use he may make of the money so paid in. And as being a mere debt, a customer's right to recover money paid in is barred on the expiration of six years by the Statute of Limitations, if there has been no payment meantime on account of principal or interest, and no acknowledgment sufficient to bar the statute (*Pott v. Clegg*, 16 M. & W. 321). Such a state of affairs, however, is hardly likely to arise, inasmuch as, in the absence of specific appropriation, earlier drawings out are attributed to the earlier payments in, as in the ordinary case of current accounts, and so the items on the credit and debit side cancel each other. An apparent exception to this system of appropriation exists in cases where a man wrongfully pays into his own account monies held by him in a fiduciary capacity. In such circumstances he is presumed to have drawn out his own monies rather than those affected by the trust, and so long as the account is in credit, any balance will be

Banker
and
customer.

attributed to the trust money. As between contending claims to the money, based on different breaches of trust, the ordinary rule of appropriation will apply.

It has often been suggested that the only method of withdrawing money from a banker is by cheque, that the presentation of a cheque is a condition precedent to the liability of the banker to repay. This is not so; such a view being inconsistent with the cases establishing the effect of the Statute of Limitations on money left in a banker's hands, and with the numerous cases in which a balance at a bank has been attached as a simple and unconditional debt by a garnishee order, as, for instance, in *Rogers v. Whiteley*, 1892, A. C. 118. The banker's position with regard to cheques is that, super-added to the relation of debtor and creditor, there is an obligation to honour the customer's cheques provided the banker has a sufficient and available balance in his hands for the purpose (*Foley v. Hill*). If, having such funds in his hands, the banker dishonours a cheque, he is liable to the customer in substantial damages without proof of actual injury having accrued (*Rolin v. Steward*, 14 C. B. 595). It would further seem a legitimate condition that the cheque should be drawn in the ordinary recognized form, not in one raising any question or doubt as to its validity or effect. Cheques drawn to "wages or order," "petty cash or order," or the like, are common, and are usually regarded as payable to bearer. Such payees are not, however, "fictitious or non-existent persons," so as to render the cheques payable to the bearer under sec. 7, subs. 3 of the Bills of Exchange Act, 1882, hereinafter referred to, nor can such payees indorse. Some banks, therefore, refuse to pay such cheques, and it is conceived they are justified in so doing. Money paid in so shortly before the presentation of the cheque that there would not have been time to pass it through the books of the bank would not be treated as available for this purpose. If a person have an account at one branch of a bank, he is not entitled to draw cheques on another branch where he has either no account or is overdrawn, but the bank has, as against the customer, the right to combine accounts at different branches and treat them as one account (*Garnet v. M'Ewen*, L. R. 8 Ex. 10).

The very questionable practice of post-dating cheques has been the source of considerable doubt and inconvenience to bankers. The use of such documents enables the drawer to obtain the results of a bill at a fixed future date without the expense of a regular bill-stamp. But the Bills of Exchange Act, 1882, sec. 13, subs. 1, provides that "a bill is not invalid by reason only that it is ante-dated or post-dated, or that it bears date on a Sunday." It seems very possible that the drawer may be liable to penalties under the Stamp Act, 1891, either for issuing a document improperly stamped, or for executing an instrument in which all the facts and circumstances affecting its liability to stamp duty are not truly set forth, inasmuch as a post-dated cheque is not really payable on demand, but only on demand after a future date. These, however, are matters with which the banker is not concerned. He cannot refuse to pay a cheque presented after the apparent date of its issue on the ground that he knows it to have been post-dated. On the other hand, he is entitled and indeed bound to refuse payment if such a cheque is presented before the apparent date of its issue.

The banker is bound to observe secrecy with respect to the customer's account, unless good cause exists for disclosure, and the obligation does not cease if the account becomes overdrawn (*Hardy v. Veasey*, L. R. 3 Ex. 107). In England a cheque is not an assignment of funds in the banker's hands (Bills of Exchange Act, 1882,

sec. 53). The holder of the cheque has therefore no claim on the banker in the event of payment being refused, his remedy being against the drawer and indorser, if any. On this section is also based the custom of English bankers not to pay part of the amount of a cheque where there are funds, though not sufficient to meet the whole amount. The section does not apply to Scotland, where it would seem that the bank is bound to pay over what funds it has towards satisfaction of the cheque. A banker is entitled to hold paid cheques as vouchers until there has been a settlement of account between him and the customer. The entries in a pass-book constitute *prima facie* evidence against the banker, and when returned by the customer without comment, against him; but in either case such evidence may be displaced by proof that the entries have been made by mistake and do not represent the true state of the account. It has been held, however, that where the customer has altered his position on the faith of entries in the pass-book showing money to have been received, the banker cannot afterwards deny the receipt of such monies or retain others in satisfaction of them (*Skyring v. Greenwood*, 4 B. & C. 281). Acquiescence by the customer in a course of business indicated in the pass-book will justify the banker in treating such course of business as established for the future so long as the relation of banker and customer continues. In this manner the banker may acquire the right to charge interest or even compound interest on overdrafts, neither of which he is entitled to do at common law.

The above-mentioned rule, by which the holder of a cheque has no direct recourse against the banker who dishonours it, holds good even where the banker has marked or certified the cheque as good for the amount, such marking not amounting to an acceptance by the banker. As between banker and banker, however, such marking or certifying probably amounts to a binding representation that the cheque will be paid. In the United States, on the contrary, a certified cheque gives the holder a direct claim against the banker, and if the cheque be so certified at the instance of the holder this operates as a complete discharge to the drawer.

Where legislation has intervened for the protection of the banker, it has usually been to counterbalance some particular risk which would otherwise have been imposed upon him by enactments primarily intended to safeguard the customer. Thus in 1853 the Stamp Act of that year made a penny stamp sufficient for an order cheque as well as a bearer cheque, the object being the protection of the drawer by making it impossible for a wrongful holder to obtain payment without committing forgery. But it was recognized that this would cast a new burden on the banker, who would obtain no discharge by paying on a forged indorsement. A section was therefore inserted in the Act, relieving the banker from responsibility in case of payment on a forged or unauthorized indorsement, and the provisions of this section are practically re-enacted by sec. 60 of the Bills of Exchange Act, 1882. It appears, however, very doubtful whether this section protects a banker who, according to the usual custom, demands and obtains the signature of an ostensible payee on the back of an order cheque presented by him for payment in that character. Such signature is not an indorsement within sec. 2 of the Act, and the payment is not made on the forged indorsement, nor to him as indorsee, but as payee.

So again with crossed cheques. The custom of crossing cheques originated between bankers at the Clearing House, and was adopted by the public for a considerable period before it received any legislative recognition or efficacy. At this stage such crossing only operated as a warning to the banker on

Crossed
cheques.

whom the cheque was drawn to exercise caution in paying the cheque otherwise than to a banker if crossed generally, or to a particular banker if crossed specially. Various statutes, now repealed, were passed between 1856 and 1882 dealing with the subject, the effect of which is reproduced by the Bills of Exchange Act, 1882. That statute authorizes various forms of crossing, and renders the paying banker liable, not only to the drawer, but also to the true owner, for any loss he may have sustained by reason of the banker having paid the cheque contrary to the crossing. The system, designed in the interest and for the protection of the public, imposed new burdens on the paying banker and indirectly on the collecting banker. It necessitated the intervention of a banker for the obtaining payment of any crossed cheque, thus largely increasing the mass of such business and the risk of the collecting banker being held liable in any case where he had collected a cheque for a person who had no title to it, as where it was held under a forged indorsement. Some counterbalancing advantages were therefore conferred on bankers. By sec. 80 it was enacted that where a banker on whom a crossed cheque is drawn, in good faith and without negligence pays it, if crossed generally, to a banker, and, if crossed specially, to the banker to whom it is crossed or his agent for collection, being a banker, he shall be entitled to the same rights and be placed in the same position as if payment of the cheque had been made to the true owner thereof. Exemption from liability in respect of payment of a crossed cheque was thus ensured to the paying banker in certain cases in which he might not have been able to debit his customer with payment of an open cheque. The protection to the collecting banker is contained in sec. 82, which enacts that "when a banker in good faith and without negligence receives payment for a customer of a cheque crossed generally, or specially to himself, and the customer has no title or a defective title thereto, the banker shall not incur any liability to the true owner of the cheque by reason only of having received such payment." This section has been the subject of much judicial interpretation, both as to what constitutes a customer and when a bank receives payment for the customer and when for itself. A single isolated transaction cannot constitute a man a customer (*Matthews v. Williams, Brown & Co.*, 10 *Times L. R.* 386; *Lacave v. Crédit Lyonnais*, 1897, 1 *Q. B.* 148). But where the relation of banker and customer exists, the fact that the account is overdrawn does not preclude the banker who has received the proceeds of a cheque paid in by his customer from protection (*Clarke v. The London and County Bank*, 1897, 1 *Q. B.* 552), the transaction being regarded as in substance a collection for the customer, although the banker might be benefited by the reduction of the overdraft. The judgment of the House of Lords (given on 22nd July 1901) in the case of *The Great Western Railway Co. v. The London and County Bank* (1901, *A. C.* 414) contains an authoritative exposition of this section. In that case a rate-collector named Huggins had for many years been in the habit of obtaining at one of the branches of the defendant bank cash for cheques drawn in his favour on other banks. He was consequently well known there, but kept no account with the defendant bank, and his only transactions with them were of the above nature. He fraudulently obtained from the plaintiff company a cheque to his own order crossed "not negotiable." This cheque he took to the defendants' branch and endorsed to them, receiving the full face value at once, save for a small balance which by his direction was put to another account, and the defendant bank in due course received the proceeds of the cheque from the bank on which it was drawn. The judge of first instance and the Court of Appeal held that

the defendants were protected by sec. 82, having received payment of the cheque for a customer in good faith and without negligence, and gave judgment in favour of the bank. This judgment was reversed by the House of Lords, and judgment given for the plaintiffs, the main grounds of the judgment being that the dealings between Huggins and the bank were not properly describable as banking transactions, and could not therefore, however long continued, constitute him a customer, and secondly that, whether the bank were to be regarded as having purchased the cheque or as having advanced the full amount on the security of it, they had received the proceeds for themselves and not for Huggins. It may now therefore be taken as settled law that to constitute a man a customer within this 82nd section he must either have an account with the bank or at the least must be in the habit of resorting to the bank in the course of ordinary banking transactions productive of advantage to both parties, and further, that a bank which has given cash over the counter for a cheque drawn on another bank cannot subsequently set up that it received the proceeds for any one but itself. Lord Brampton in this case enunciated a dictum or suggestion to the effect that, even supposing the case had been one of banker and customer and of genuine collection for the customer, still the fact of the cheque being marked "not negotiable" would or might have made a difference and deprived the bank of the protection of the section, on the ground that it was negligence to collect such a cheque without inquiry, even for the ostensible payee. Obviously such addition to the crossing can have no application whatever where there has been no transfer of the cheque. And it is equally obvious that the fact of the customer being the transferee of a cheque crossed "not negotiable" in nowise affects the liability of the collecting banker. Under sec. 76 of the Bills of Exchange Act the words "not negotiable" are simply made an optional integral part of the crossing, and so when sec. 82 speaks of negligence in relation to a crossed cheque, it can only mean negligence altogether independent of the form of the crossing. Again, the bearing and design of the "not negotiable" crossing is, under sec. 81, to affect the title of the transferee, and sec. 82 specially protects the banker in cases where, other conditions being fulfilled, the customer has either no title or a defective title to the cheque. Section 77, subs. 6, of the Bills of Exchange Act provides that "when an uncrossed cheque, or a cheque crossed generally, is sent to a banker for collection he may cross it specially to himself." It would appear somewhat doubtful whether this enables a banker to avail himself of the protection of sec. 82 by crossing an open cheque received by him for collection. In *Bissell v. Fox*, 51 *Law Times Rep.* 663, Denman, J., expressed the opinion that sec. 82 only applied where the banker received the cheque already crossed, but this subsection was not brought to his notice, not being applicable to the case, and there are grounds for believing that it was expressly introduced for the purpose of enabling bankers so to protect themselves. The addition to a crossing of the words "not negotiable" was sanctioned and its effect defined by the Crossed Cheques Act, 1876, and re-enacted by sec. 81 of the Bills of Exchange Act, 1882. Curious misapprehensions have existed with regard to this crossing, owing probably to the somewhat ambiguous words employed. The presence of such a crossing does not preclude the transfer of the cheque. The word "negotiable" is not used as equivalent to "transferable" as it is elsewhere in the Act (see sec. 8, subs. 1). It denotes that the cheque is not fully negotiable, and the statutory effect annexed by the section to such crossing is to put the cheque on the footing of an overdue bill, with the result

that a person taking a cheque so crossed takes it subject to all equities affecting it, and can neither acquire nor pass on a better right either to the cheque itself or the money realized by means of it than the person from whom he took the cheque. But so long as there is nothing wrong with the cheque or the circumstances attending its issue or transfer, it may pass through any number of hands, and be enforced by the holder for the time being. See the judgment of Vaughan Williams, L.J., in *Great Western Railway v. The London and County Bank*, 1900, 2 Q. B. 464, and of the House of Lords in the same case. The addition of these words to the crossing in no way prejudices the protection afforded under the crossed cheques sections of the Bills of Exchange Act, 1882, to the paying banker, on whom the crossing only imposes the duty of seeing that the cheque reaches him through the proper channel.

A practice has grown up of adding to the crossing of a cheque the words "account payee," or similar words indicating an intention that the cheque shall be placed to some particular account. There is no statutory sanction for such an addition, and its effect is somewhat doubtful. It was decided in *National Bank v. Silke*, 1891, 1 Q. B. 435, that the addition of such words did not prevent the cheque being transferable. Nor can such words have the statutory effect attributed to the words "not negotiable" by sec. 81 of the Bills of Exchange Act, 1882. Probably the only effect of such crossings as "account payee" is one analogous to that of an ordinary crossing before the legislature intervened, or now of an indorsement being *per pro.*, namely, to impose a greater degree of caution upon the banker who receives a cheque so crossed for an account other than the one indicated; but the point has still to be definitely decided.

The protection of the banker against forged indorsements under sec. 60 of the Bills of Exchange Act, 1882, **Forgeries.** extending only to bills or cheques payable to order on demand, the banker is not discharged in other cases by payment on a forged indorsement, unless circumstances exist to take the case out of the general rule. Such circumstances existed in the well-known case of *Vagliano v. The Bank of England*, 1891, A. C. 107. In that case, by the fraud of the plaintiff's clerk, a genuine acceptance of the plaintiff's was obtained to documents in the form of bills to which the drawer's name was forged, and to which the name of the payees to whose order they were drawn was subsequently forged as indorsers. The names utilized as those of drawer and payee were the names of persons having business transactions with the plaintiff Vagliano, and their names were selected as giving colour to the fraud. All the bills were accepted payable at the Bank of England where Vagliano had a large account. Their coming forward for payment was notified to the bank by letters of advice, which referred also to genuine bills, Vagliano's signature to the letters being fraudulently obtained. The fabricated bills were presented to the bank for payment by or on behalf of the fraudulent clerk, and paid by the bank over the counter. There were forty-three of such bills, and the amount realized by the clerk was £71,500, with which, on discovery of the frauds and conviction of the clerk, Vagliano refused to be debited. The House of Lords, by a majority, ultimately decided in favour of the bank. The main grounds of the judgment were as follows: That whether the documents could properly be termed bills or not, they must be treated as such as against Vagliano who had accredited them as such, and whose case against the bank was based on their possessing that character; that, inasmuch as the persons whose names appeared as payees and indorsers, though really existing people known to Vagliano, were

never intended to have and never could have had anything to do with the bills, the bills came within the provisions of sec. 7, subs. 3 of the Bills of Exchange Act, 1882, which enacts that "Where the payee of a bill is a fictitious or non-existent person, the bill may be treated as payable to bearer"; that whatever may have been the law prior to the Bills of Exchange Act, it was not necessary for the operation of this subsection that the fictitious or non-existent character of the payee should be within the knowledge of the acceptor or other person sought to be made liable; that it was open to any one whose interest it was to do so to treat the bills as payable to bearer, that the bank was entitled to do so, and was therefore discharged; that apart from these considerations, the bank were agents for Vagliano in the payment of bills accepted payable there, that Vagliano's own act in accepting the bills and signing the letters of advice, and his omission to take any steps to verify the supposed transactions when circumstances occurred which might have aroused suspicion, were the direct cause of the bank's making the payments on his behalf, and that he was therefore not entitled to repudiate them. It was incidentally decided in this important case that a banker is not entitled to a reasonable time in which to make inquiries and satisfy himself as to the genuineness of the indorsements on a bill, but must pay or refuse payment at once. Prior to this date the contrary opinion had prevailed, founded on a dictum of Maule, J., in *Roberts v. Tucker*, 16 Q. B. 560; and when once the payment has been made, the banker, on discovery of the forgery, would appear to have no power, as against an innocent party, to retract it or claim repayment of the money. Such a payment has no doubt been made under a mistake of fact, and so under ordinary rules of law would be recoverable, but it is essential for the free circulation of negotiable instruments that their payment or dishonour should be conclusive as well as immediate, and if in the interval between payment and the claim for the return of the money the payee's position might have been altered, as would almost invariably be the case, the money is not recoverable (*London and River Plate Bank v. The Bank of Liverpool*, 1896, 1 Q. B. 7). This somewhat rigorous rule has been modified in Canada. By an Act of the Canadian Legislature passed in 1897, if a bill bearing a forged or unauthorized indorsement is paid in good faith and in the ordinary course of business by or on behalf of the drawee or acceptor, the money may be recovered from the person to whom it was paid or from any indorser who has indorsed the bill subsequently to the forged or unauthorized indorsement, provided notice be given in the same manner as notice of dishonour. It was the more imperative on Canada to take this step because bankers there have no such protection in case of payment of bills payable on demand or cheques on a forged or unauthorized indorsement as is afforded in England by sec. 60 of the Bills of Exchange Act, 1882.

Another class of forgery to which bankers are more or less exposed is where the amount of a cheque is fraudulently altered, and the banker is thereby induced to pay the larger sum. In such cases the question arises whether he is entitled to debit the customer's account with the increased amount. In *Young v. Grote*, 4 Bing. 253, a man left signed blank cheques with his wife to be filled up as business required. The wife delivered one to a clerk with instructions to fill it up for a particular sum. He filled it up for that sum, but purposely left spaces to allow of the introduction of other words and figures. He showed it to the wife in this state, who told him to get it cashed; the clerk then added words and figures, raising the apparent amount by £300, which the

clerk obtained from the banker and appropriated. The court held that the bank were entitled to debit the account with the larger sum. The reasons assigned by the different judges were various and somewhat obscure, and probably no case has ever been so much discussed, doubted, and even dissented from as this one, which Lord Esher once described as "the fount of bad argument." The most recent criticisms upon it appear in the case of *Scholfield v. Lord Londesborough*, 1896, A. C. 514. There the House of Lords held that there was no duty on the part of the acceptor of a bill towards the possible holder binding him to take precautions against fraud of this nature, but there are passages in the judgments which distinctly recognize that such a duty may exist on the part of a customer towards his banker by virtue of the relation of mandant and mandatory, and the authority of *Young v. Grote* may be regarded as considerably rehabilitated by these expressions of opinion.

The question of a banker's responsibility for the loss of valuables deposited with him by a customer for safe-keeping was raised, but not decided, in an action brought by Mrs. Langtry against the Union Bank of London in 1896. Certain jewels belonging to

Valuables deposited.

her had been delivered up by the bank to an unauthorized person on a forged order. The case was settled; but bankers being desirous to ascertain their real position, many legal opinions were taken on the point, and after consideration of these, the Central Association of Bankers issued a memorandum, in which they stated that the best legal opinion appeared to be that a distinction must be drawn between cases in which valuables were by mistake delivered to the wrong person and cases in which they were destroyed, lost, stolen, or fraudulently abstracted, whether by an officer of the bank or some other person. That in the former case the question of negligence did not arise, the case being one of wrongful conversion of the goods by a voluntary act for which the bank was liable apart from any question of negligence. That, in the second case, that of loss or theft, the banker being a gratuitous bailee, would only be liable if he had failed to use such care as an ordinary prudent man would take of valuables of his own. The latter rule is practically that laid down in *Giblin v. MacMullen*, L. R. 2 P. C. 318, but in estimating the amount of care to be taken by the banker, the nature of the goods, if known or suspected, and the exceptional means of protection at the disposition of bankers, such as strong-rooms, must be taken into consideration. Methods of obviating both classes of risk by means of special receipts have frequently been suggested, but such receipts do not appear to have come into general use.

This gratuitous assumption of the custody of valuables, like the collection of cheques and the usage by which bills are ordinarily accepted payable at a banker's, and presented and paid there, is an abnormal graft upon the original and simple system of banking. Banks are compelled to afford such facilities and undertake the resultant liabilities by the pressure of competition increasingly enhanced by the concurrence of Post Office and Trustee Savings Banks, state-aided institutions whose returns conclusively demonstrate that they are utilized by classes for whose benefit they were never intended. And naturally this multiplication of the banker's functions complicates his legal position, inasmuch as, according to the branch of business he is in a particular case pursuing, he may have to be regarded as a debtor, a creditor, an agent, or a bailee.

Apart, too, from such unusual transactions as the cashing of crossed cheques over the counter, many banks undertake the discounting of bills and the granting of

advances on various classes of securities. This latter branch of business falls within the region of general rather than banking law, but the question has frequently arisen whether a bank has taken a cheque in its capacity as agent for collection, or whether it has taken it as a transferee in the same way as a discounted bill. Banks invariably claim the right of redebiting a customer's account with any cheque which has been dishonoured on presentation, whether such cheque was indorsed by the customer or not, and notwithstanding any entry in the books with regard to such cheque. Such course is only justifiable on the supposition that the banker is acting purely as an agent for collection. Where the account is overdrawn at the time the cheque is paid in, when the customer is allowed to draw against the cheque before it is cleared, or where the cheque is at once entered as cash either in the pass-book or the books of the bank, there are authorities, such as *ex p. Richdale*, 19 Ch. D. 409; *McLean v. The Clydesdale Bank*, 9 A. C. 95; and *Royal Bank of Scotland v. Tottenham*, 1894, 2 Q. B. 715, which go to prove that the bank become holders for value and proprietors of the cheque in their own right, a position inconsistent with that of a mere agent for its collection. It may be difficult logically to justify the conclusion, but from the late cases of *Gaden v. The Newfoundland Savings Bank*, 1899, A. C. 281, and *J. Bavins, Jun., and Sims v. The London and South-Western Bank*, 1900, 1 Q. B. 270, it would appear that in all such cases the bank has really an option which character it will assume, and can, as suits its interest, either redebit the customer, or proceed against the other parties liable on the instrument in its own right as a holder in due course. The *prima facie* presumption would seem to be that a bank, not being a discount bank, is not likely to have taken the document as a transferee, leaving it, however, open to the bank to assert that it did so. The existence of the banker's lien enables him in many cases to enforce for his own benefit negotiable instruments strictly belonging to the customer. A banker has a lien over all securities of the customer coming to his hands in his capacity of banker for the amount of the general balance due from the customer. The lien extends to money, but not to goods or securities deposited for a specific purpose, as for safe custody, and it is excluded where another agreement relating to the subject-matter is shown.

The unauthorized pledging by stockbrokers or money-brokers of their clients' securities to secure advances from banks to themselves has given rise to important and apparently conflicting decisions of the House of Lords. In 1888 that tribunal gave judgment in the case of *Lord Sheffield v. The London Joint Stock Bank*, 13 A. C. 333. That judgment was widely understood as laying down the general proposition, that the nature of the business of the borrower which necessitates his being entrusted with securities belonging to other people was sufficient to put the banker on inquiry as to the extent of his authority to deal with them. In the later case of *Simmons v. The London Joint Stock Bank*, 1892, A. C. 201, the House of Lords expressly declared that Lord Sheffield's case had been decided simply on the facts, which, in their Lordships' opinion, established actual knowledge on the part of the bank of the limited authority of the agent, and that no such proposition as is above referred to was to be deduced from that case. It must, therefore, be taken that no new legal principle was embodied in the earlier case. Nor was any new doctrine enunciated in the judgments in Simmons's case. They merely applied the ordinary rule of law by which the transferee of a negotiable instrument, whether the transfer

Pledging of securities.

be absolute or by way of pledge, if he take it in good faith and for value, and before it is overdue, acquires an independent title, unaffected by any equities existing against previous holders. Their Lordships expressly disclaimed the idea that there was anything in the nature of the business of a stockbroker or money-dealer to put a bank on inquiry as to his authority to deal with securities in his hands tendered as cover for a personal advance. The possession by an agent of negotiable instruments is, in the absence of extrinsic suspicious circumstances, sufficient evidence of his authority to deal with them in any way he pleases. This view, being based on the essential character of negotiable instruments, only applies to such as are in their nature fully negotiable, that is, which possess the quality of vesting in a *bona-fide* holder for value an independent title against all the world.

Outside bills, notes, and cheques, the category of fully negotiable instruments is a somewhat indeterminate one.

It includes all such securities as either by statute or by the custom of merchants have acquired this particular quality. It has been claimed that custom of the Stock Exchange to treat a security as fully negotiable is, apart from statute, the only trustworthy test. It would probably be more correct to say, that in order to attain the status of full negotiability a security must be on its face negotiable and recognized as such by the mercantile community of the United Kingdom at large. Negotiability in the country of its origin is no evidence of negotiability in England (*Picker v. The London and County Bank*, 18 Q. B. D. 515). It has been contended on the authority of *Crouch v. Crédit Foncier*, L. R. 8 Q. B. 374, that, with regard to English securities, at any rate, evidence of modern mercantile usage was inadmissible to affix the character of negotiability to an instrument not recognized as negotiable by statute, or by that ancient custom of merchants which has been adopted by the common law. The judgment of Mr. Justice Kennedy in the *Bechuanaland Exploration Company v. The London Trading Bank, Limited*, 1898, 2 Q. B. 658, seems, however, to show conclusively that this view is not in accordance with the decision of the House of Lords in *Goodwin v. Roberts*, 1 Ap. Cases, 476, and that when once a security, whether English or foreign, is universally recognized and treated by the mercantile community of Great Britain as negotiable, the fact of its acceptance as such being recent is no bar to its admission into the category of negotiable securities.

Bankers are affected or protected in certain cases by special legislation annexing to particular classes of documents incidents usually found in connexion with strictly negotiable instruments. Thus, section 95 of the Bills of Exchange Act, 1882, extends to dividend warrants the provisions of the Act regarding crossed cheques; and sec. 17 of the Revenue Act, 1883, makes the same provisions applicable to "any document issued by a customer of any banker, and intended to enable any person or body corporate to obtain payment from such banker of the sum of money mentioned in such document." In dealing with such documents the banker must always bear in mind that it is only the crossed cheques sections of the Act which are applied by the above-mentioned legislation. Unless the documents are in themselves negotiable, either as being cheques within the terms of the Bills of Exchange Act, or as having acquired negotiability by statute or custom, they remain non-negotiable and even non-transferable instruments, and must be treated as such. The class of document, now so common, in which payment is made conditional on an annexed receipt being signed, dated, and presented with the order for payment, or in which payment is made dependent on presentation within

a specified period, are not cheques or negotiable instruments, though included in the above legislation. Bankers, therefore, would not be safe in collecting them for persons other than the actual payee, notwithstanding the crossing.

The rule laid down by the House of Lords in *Rogers v. Whiteley*, 1892, A. C. 118, as to the course to be adopted by a banker on whom a garnishee order nisi is served in respect of a judgment recovered against his customer, appears to impose a hardship on the latter. The garnishee order binds all debts due or accruing due to the customer to answer the judgment debt. The House of Lords held that however much the balance to the customer's credit exceeded the stated amount of the judgment debt, the banker, after service of the order, was entitled and indeed bound to hold the whole balance, and to dishonour all cheques of the customer presented after that date, whether drawn before the order was served or not. It was suggested in some of the judgments that steps might be taken to modify this result of the process, but up to the present no alteration in the practice has been notified.

Although, as before stated, a banker is entitled to combine several accounts against the customer, he cannot do so in the face of an established course of business by which they are kept separate (*Buckingham v. The London and Midland Bank*, 12 Times L. R. 70). It is further deducible from this case that a bank is not entitled arbitrarily to close a customer's account when in credit by tendering him the balance, or offering to transfer it to another bank. Provision must at least be made for outstanding cheques, and the practice of referring them to another bank is not an adequate provision, as it involves technical dishonour of the cheques.

The Bankers' Books Evidence Act, 1879, was passed to obviate the inconvenience and dislocation of business caused to bankers by their being compellable to produce their books in court, in legal proceedings to which they were not parties. It provides that duly authenticated copies of entries in such books shall be receivable as evidence of such entries, and the matters, accounts, and transactions therein recorded, and that no banker or officer of a bank shall in any legal proceedings, to which the bank is not a party, be compellable to produce books or attend as a witness where such evidence could be supplied under the provisions of the Act unless a judge for special cause so orders. Provision is also made for inspection of bankers' books by parties to any legal proceedings who obtain a judge's order for the purpose. Although the exercise of this latter power is not in terms limited to inspection of the account of one of the parties to the litigation, an order will not be made for the inspection of the account of any other person save in exceptional circumstances, such, for instance, as there being ground for believing that the account, though in another name, is substantially the account of the litigant (*Pollock v. Garle*, 1898, 1 Ch. 1; *South Staffordshire Tramways Co. v. Ebbsmith*, 1898, 2 Q. B. 669).

Banks frequently decline to open accounts under headings denoting that the customer holds the money in a fiduciary capacity, such as that of trustee or executor. But even if an account is so headed, or if the bank is otherwise affected with notice of its being a trust account, the bank is not entitled to raise any question whether cheques drawn on it are drawn for or applied to proper purposes. Presumably, however, a banker would be justified in refusing to honour a cheque drawn on the account, the object of which was to benefit himself, as, for instance, to pay off an ascertained overdraft on the customer's private

Garnishee orders.

Legal evidence.

Fiduciary accounts.

account; and a banker will not be allowed to retain any benefit from a payment made in circumstances amounting to privity on his part with the breach of trust (*Gray v. Johnston*, L. R. 3 H. of L. 1), as where, for instance, the banker has pressed for the payment of an ascertained overdraft on private account and received a cheque on the trust account for that purpose. The mere fact that money standing to the credit of a trust account was transferred to an overdrawn private account on which no balance had been struck, and for the liquidation of which no application had been made, and, being so transferred, wiped out the overdraft, was held in *Gray v. Johnston* not to show any privity on the part of the banker with the breach of trust, and he retained the money so transferred against the beneficiaries.

Bankruptcy.—The history of English bankruptcy legislation prior to the year 1869, and the chief features of the Consolidating and Amending Act passed in that year, are briefly set forth in the article on "Bankruptcy" in the ninth edition of this work. The main object of the Act of 1869 was to remedy abuses which had grown up under previous bankruptcy Acts, the effect of which, to adopt the language of Sir Robert Collier, the then Attorney-General, had been to enable a bankrupt to "defraud those to whom he was indebted, and to set them at defiance." Lord Cairns, in introducing the measure in the House of Lords, also expressed the opinion that the large increase which had taken place in the annual insolvency of the country during the preceding years could not "be attributed to depression in trade, but must be traced to the enormous facilities which are given to debtors who wish to be released from their debts on easy terms." It is a curious illustration of the difficulties which have attended bankruptcy legislation in England, that the measure which was passed in 1869 to remedy these defects was described twelve years later by Mr Chamberlain, the President of the Board of Trade, in introducing an Amending Bill, as "the most unsatisfactory and the most unfortunate of the many attempts which had been made to deal with the subject," and as "the object of the almost unanimous condemnation of all classes." This result cannot be regarded as due to any new departure or change of principle in the Act of 1869, which, on the contrary, while it introduced some amendments in the methods of procedure which were apparently well calculated to effect a reform of many of the abuses complained of, followed in the main the lines of the immediately preceding legislation. The failure of the measure was rather the failure of a long-continued line of policy; and the fact that after half a century's experience of legislation, directed by the ablest minds in the legal profession, matters had grown worse instead of better, was calculated to cast serious doubts on the soundness of the principles on which the various bankruptcy Acts from 1825 to 1869 had been based. During this period no less than six measures of first-class importance had received the assent of the Legislature, viz. the Acts of 1825, 1831, 1842, 1849, 1861, and 1869, each of which was a practical acknowledgment of the failure of its predecessor; and the last of these, as already stated, was admitted to be the most unsatisfactory in its results.

In order to understand the causes of these successive failures, it is necessary to bear in mind the complex character of the con-

siderations which enter into the question. Bankruptcy law was primarily a branch of the criminal law, its object being to punish fraudulent bankrupts, and to compel the surrender of their property for the benefit of creditors, but without releasing the debtor from his obligations. Subsequent legislation introduced the principle of granting relief to the bankrupt with or without the consent of the creditors, where he conformed to the provisions of the bankruptcy law. But the whole of the procedure was conducted by or under the supervision of the court exercising jurisdiction in bankruptcy. On the other hand, the right of creditors to exercise some control over the realization of the debtor's property through an assignee chosen by themselves was recognized at an early date, but this right was also exercised subject to the supervision of the court, which investigated the claims of creditors and determined who were entitled to take part in the proceedings. Provision was also made for the interim protection of the debtor's property by official assignees attached to the court, who took possession until the creditors could be consulted, and under the supervision of the court audited the accounts of the creditor's assignee. So long as this system continued substantial justice was generally secured; the claims of creditors were strictly investigated, and only those who clearly proved their right before a competent court were entitled to take part in the proceedings. The bankrupt was released from his obligations, but only after strict inquiries into his conduct, and under the exercise of judicial discretion. The accounts of assignees were also strictly investigated, and the costs of solicitors and other agents were taxed by officers of the court. But the system was found to be cumbrous, to lead to delay, and too often to the absorption of a large part of the estate in costs, over the incurring of which there was a very ineffective control. Hence arose a demand for larger powers on the part of creditors, and the introduction into the bankruptcy procedure of the system of "arrangements" between the debtor and his creditors, either for the payment of a composition, or for the liquidation of the estate free from the control of the court. At first these arrangements were carefully guarded. Under the Act of 1825, a proposal for payment of a composition might be adopted only after the debtor had passed his examination in court, and with the consent of nine-tenths in number and value of his creditors assembled at a meeting. Upon such adoption the bankruptcy proceedings were superseded. Dissenting creditors, however, were not bound by the resolution, but could still take action against the debtor's subsequently acquired property. These powers were not found to be sufficiently elastic, and the Act failed to give public satisfaction. Attempts were made by the Acts of 1831 and 1842 to remedy the defects complained of, by a reconstitution of the Bankruptcy Court and its official system. But these measures also failed, because they were based on the assumption that judicial bodies could exercise effective control over administrative action, a control for which they are naturally unsuited, and which they could only carry out by cumbrous and expensive methods of procedure. Under the Act of 1849 a totally new principle was introduced by the provision that a deed of arrangement executed by six-sevenths of the creditors for £10 and upwards should be binding upon all the creditors without any proceedings in or supervision by the court. But the determination of the question who were or were not creditors was practically left to the debtor himself, without any opportunity for testing by independent investigation the claims of those who signed the deed to control the administration of the estate. It is not difficult to see, in the light of subsequent experience, how well calculated this provision was to encourage fraudulent arrangements, and to introduce laxity in the administration of debtors' estates. A modification of the too stringent conditions of the Act of 1825, which would have enabled a bankrupt to pay a composition on his debts, with the consent of a large proportion of his *bond-fide* creditors, and subject to the approval of the court, after hearing the objections of dissenting creditors, would doubtless have proved a beneficial reform, but the Act of 1849 proceeded on a very different principle. Instead of reforming, it practically abolished judicial control. By avoiding Scylla it fell into Charybdis. To give any majority of creditors the power to release a debtor from all his obligations without full disclosure of his affairs, and without any exercise of judicial discretion or any investigation into the causes of the failure, or the conduct of the debtor, would in any circumstances have been to introduce a new and mischievous principle into legislation. But to give such a power to creditors whose claims were subject to no independent investigation was to invite inevitable confusion and failure. Yet this was the dominating principle of English bankruptcy legislation for nearly thirty-five years. Under the Act of 1861 the evil was aggravated, by reducing the majority required to make a deed of arrangement binding on all the creditors, to a majority in number and three-fourths in value of those whose claims amounted to £10 and upwards. It was these provisions which, according to the highest judicial authorities, enabled bankrupts

to defraud their creditors and set them at defiance. Yet, in the legislation which ensued, this fact appears to have been entirely ignored. Under the Act of 1869, which was passed for the avowed purpose of remedying the evils which had arisen, the procedure under a bankruptcy petition was certainly rendered more effective. Meetings of creditors were presided over, and creditors' claims were, for voting purposes, adjudicated upon by the registrar of the court; the bankrupt had to pass a public examination in court, which although chiefly left to the trustee appointed by the creditors, afforded some opportunity for investigation; and the bankrupt could not obtain his discharge without the approval of the court, and in certain circumstances the consent of the creditors. An independent official, the Comptroller in Bankruptcy, was appointed, whose duty it was to examine the accounts of trustees, call them to account for any misfeasance, neglect, or omission, and refer the matter to the court for the exercise of disciplinary powers where necessary. These provisions were well calculated to promote sound administration, but they were, unfortunately, rendered nugatory by provisions relating to what were practically private arrangements on similar lines to those which had rendered previous legislation ineffective. In some respects the evil was aggravated. Deeds of arrangements were nominally abolished, but under sections 125 and 126 of the Act, a debtor was empowered to present a petition to the court for liquidation of his affairs by "arrangement," or for payment of a composition, whereupon a meeting of creditors was summoned from a list furnished by the debtor, and without any judicial investigation of claims, a majority in number and three-fourths in value of those who lodged proofs of debt, and who were present in person or by proxy at the meeting, might by resolution agree to liquidation by arrangement, or to the acceptance of the composition. Such resolution thereupon became binding upon all the creditors, without any act of approval by the court, any judicial examination of the debtor, or any official supervision over the trustee's account. As a debtor was not permitted to present a bankruptcy petition against himself, his only method of procedure was that which thus removed the matter from the supervision and control of the court, and as about nine-tenths of all the proceedings under the Act of 1869 were initiated by debtors, it followed that only about one-tenth was submitted to proper investigation. It is true that the creditors might refuse to assent to the debtor's proposal, and that any creditor for £50 or upwards could present a petition in bankruptcy, but even where this course was adopted, the proceedings under the petition were, as a rule, stayed by the court if the debtor subsequently presented a proposal for liquidation or composition, and the creditor was left to pay the expenses of his petition if the requisite majority voted for the debtor's proposal. So far, therefore, as the Act was concerned, every inducement was held out to the adoption of a course which took the examination of the debtor, the conditions of his discharge, and the audit of the trustee's accounts, out of the control of the court.

One of the chief reasons why the Acts of 1849, 1861, and 1869 thus proved failures, lies in the obvious fact that the creditors of a particular estate are not, as appears to have been assumed, a homogeneous or organized body capable of acting together in the administration of a bankrupt estate. In the case of a few special and highly organized trades it may be otherwise, but in the great majority of cases the creditors have but little knowledge of each other, or means of organized action, while they have neither the time nor the inclination to investigate the complicated questions which frequently arise, and which are therefore left in the hands of professional trustees or legal agents. But the appointment of trustees under these Acts, instead of being the spontaneous act of the creditors, was frequently due to tutoring on the part of such agents themselves, or to individual creditors whose interests were not always identical with those of the general body. According to Mr. Robson, the author of a standard work on the subject, the arbitrary powers conferred by the Act of 1861 "led to great abuses, and in many cases creditors were forced to accept a composition, the approval of which had been obtained by a secret understanding between the debtor and favoured creditors, and not unfrequently by the creation of fictitious debts." These evils were greatly aggravated by the decisions of the court relating to proofs on bills of exchange, under which it was held that the holder of a current bill could prove on the bankrupt estate of an

endorser, although the bill was not yet due, and the acceptor was perfectly solvent and able to meet it at maturity. Thus in large mercantile failures, bankers and other holders of first-class bills could prove and vote on the estates of their customers, for whom the bills had been discounted, and thus control the entire proceedings, although they had no ultimate interest in the estate. But probably the greatest source of the abuses which arose under the Act of 1869 was the proxy system established by the Act, and by the rules which were subsequently made to carry it out. The introduction of proxies was no doubt intended to give absent creditors an opportunity of expressing their opinions upon any question which might arise. But the system was too often used for the purpose of stifling the views of those who took an independent part in the proceedings. The form of proxy prescribed by the rules contained no limitation of the powers of the proxy holder, and no expression of the opinion of the creditor. It simply appointed the person named in it as "my proxy," and these magic words gave the holder power to act in the creditor's name on all questions that might be raised at any time during the bankruptcy. Hence arose a practice of canvassing for proxies, which were readily given under the influence of plausible representations, such as the holding out of the prospect of a large composition, but which, when once obtained, could be used for any purpose whatsoever except the receipt of a dividend. Thus it frequently happened that the entire proceedings were controlled by professional proxy-holders, in whose hands these documents acquired a marketable value. They were not only used to vote for liquidation by arrangement instead of bankruptcy proceedings, but not infrequently the matter took the form of a bargain between an accountant and a solicitor, under which the former became trustee, and the latter the solicitor in the liquidation, without any provision for control over expenditure, or for any audit of the accounts. Even where a committee of inspection was appointed to exercise functions of control and audit, they too were often appointed by the proxy-holders, and not infrequently shared in the benefits. On the other hand, where the amount of debts represented by the proxy-holder was insufficient to carry the appointment of a trustee and committee, the votes could be sold to swell the chances of some other candidate. Where the debtor opposed these appointments, or refused to assist in carrying them by using such influence as he might possess, he sometimes became a target for the exercise of revenge. His discharge, which under liquidation by arrangement was entirely a matter for the creditors, might be refused indefinitely; and so largely and harshly was this power exercised under the proxy system, especially where it was supposed that the debtor had friends who could be induced to come to his aid, that a special Act of Parliament was passed in 1887, authorizing the court to deal with cases where, under the Act of 1869, a debtor had not been able to obtain a release from his creditors. On the other hand, the compliant debtor, although he had incurred large obligations in the most reckless manner, often succeeded in stifling investigation and obtaining his release without difficulty as a return for his aid in carrying out the arrangement.

The result of such a system could not be other than a failure. After the Act of 1869 had been in operation for ten years, the Comptroller in Bankruptcy reported that out of 13,000 annual failures in England and Wales, there were only 1000 cases (or about 8 per cent.) "to which the more important provisions of the Act for preventing abuses by insolvent debtors and professional agents applied; the other 12,000

*Effect on
bankruptcy
statistics.*

cases (or 92 per cent.) escaping the provisions which refer to the examination and discharge of bankrupts, and to the accounts, charges, and conduct of the agents employed." It is not to be supposed that all the cases in the latter class were marked by the abuses which have been here described. In a large number the proceedings were conducted by agents of high character and standing, and with a due regard to the interests of the creditors. But the facilities for fraudulent and collusive arrangements afforded by the Act, and the want of effective control over administration, inevitably tended to lower the morale of the latter, and to throw it into the hands of the less scrupulous members of the profession. The demand for reform, therefore, came from all classes of the business community. No fewer than thirteen bills dealing with the subject were introduced into the House of Commons during the ten years succeeding 1869. At length in 1879 a memorial, which was authoritatively described as "one of the most influential memorials ever presented to any Government," was forwarded to the Prime Minister by a large body of bankers and merchants in the City of London. The matter was then referred to the President of the Board of Trade (Mr Chamberlain), who made exhaustive inquiries, and in 1881 introduced a measure which, with some amendments, finally became law under the title of the "Bankruptcy Act, 1883." Hitherto the question had been dealt with as one of legal procedure; it was now treated as an act of commercial legislation, the main object of which, while providing by carefully framed regulations for the equitable distribution of a debtor's assets, was to promote and enforce the principles of commercial morality in the general interests of the trading community. One of the chief features of the Act

Act of 1883. of 1883 is the separation which it has effected between the judicial and the administrative functions which had previously been exercised by the court, and the transfer of the latter to the Board of Trade as a public department of the state directly responsible to Parliament. Under the powers conferred by the Act a new department was subsequently created, under the title of the Bankruptcy Department of the Board of Trade, with an officer at its head called the Inspector-General in Bankruptcy. This department exercises, under the direction of the Board of Trade, a general supervision over all the administrative work arising under the Act. It has extensive powers of control over the appointment of trustees, and conducts an audit of their accounts; and it may, subject to appeal to the court, remove them from office for misconduct, neglect, or unfitness. A report upon the proceedings under the Act is annually presented to Parliament by the Board of Trade, and although the department is practically self-supporting, a nominal vote is each year placed upon the public Estimates, thus bringing the administration under direct parliamentary criticism and control. The Act also provides for the appointment and removal by the Board of Trade of a body of officers entitled Official Receivers, with certain prescribed duties having relation both to the conduct of bankrupts and to the administration of their estates, including the interim management of the latter until the creditors can be consulted. These officers act in their respective districts under the general authority and directions of the Board of Trade, being also clothed with the status of officers of the courts to which they are attached. While effecting this supervision and control by a public department directly responsible to Parliament, the main objects of the measure were to secure—(1) An independent and public investigation of the debtor's conduct; (2) The punishment of commercial misconduct and fraud in the interests of public morality; (3) The summary and

inexpensive administration of small estates where the assets do not exceed £300 by the Official Receiver, unless a majority in number and three-fourths in value of the creditors voting resolve to appoint a trustee; (4) Full control in other cases by a majority in value, over the appointment of a trustee and a committee of inspection; (5) Strict investigation of proofs of debt, with regulations as to proxies, and votes of creditors; (6) An independent audit and general supervision of the proceedings, and control of the funds in all cases. Besides amending and consolidating previous bankruptcy legislation, the measure also contains special provisions for the administration under bankruptcy law of the estates of persons dying insolvent (§ 125); and for enabling county courts to make administration orders for payment by instalments in lieu of committal to prison, in the case of judgment debtors whose total indebtedness does not exceed £50 (§ 122). It also provides for the getting in and administration by the Board of Trade of unclaimed dividends and undistributed balances on estates wound up under previous Bankruptcy Acts (§ 162). Lastly, it amends the procedure under the Debtors Act of 1869, dealing with criminal offences, by enacting that when the court orders a prosecution of any person for an offence under that Act, it shall be the duty of the director of public prosecutions to institute and carry on the prosecution.

An Amending Act, under the title of the "Bankruptcy Act, 1890" (53 and 54 Vict. c. 71), was passed in that year, mainly with the view of supplementing and strengthening some of the provisions of **Act of 1890.** the Act of 1883, more particularly with regard to the conditions under which a bankrupt should be discharged, and requiring that schemes of arrangement or composition should be approved by the court. It also dealt with a variety of matters of detail which experience had shown to require amendment, with the view of more fully carrying out the intentions of the Legislature as embodied in the principal Act. These two Acts are to be construed as one, and may be cited collectively as the Bankruptcy Acts 1883 and 1890. They are further supplemented by a large body of general rules made by the Lord Chancellor with the concurrence of the President of the Board of Trade, which may be added to, revoked, or altered from time to time by the same authority. These rules are laid before Parliament and have the force of law.

Besides these general Acts, various measures dealing with special interests connected with bankruptcy procedure have from time to time been passed since 1883, the chief of which are as follow, **Special Acts.** viz., the Bankruptcy Appeals (County Courts) Act, 1884; the Preferential Payments in Bankruptcy Act, 1888, regulating the priority of the claims of workmen and clerks, &c., for wages and salaries; and the Bankruptcy (Discharge and Closure) Act, 1887, dealing with unclosed bankruptcies under previous Acts.

It would be out of place in this article to attempt to answer the question how far this latest legislation has solved the difficult problems which prior to **Results of legislation.** 1883 were found so intractable. The annual reports of the Board of Trade, which are accompanied by elaborate tables of statistics, and by copious illustrations both of the working of the system and of the characteristic features and causes of current insolvency, are published as parliamentary papers, and may be usefully consulted by those interested in the subject. It appears from these reports that the total number of insolvencies dealt with under the Bankruptcy Acts during the ten years ending 31st December 1900, was 43,895, involving estimated liabilities amounting

to £69,029,795, and estimated assets amounting to £25,667,785. It may also be pointed out that, according to the official figures, the cost of bankruptcy administration under the present system has very considerably decreased as compared with that under the Act of 1869. Estates are also closed at much shorter intervals, and, what is more important from a public point of view, it appears that while the estimated liabilities of bankrupt estates during the ten years ending 1883 amounted on an average to £22,380,000 per annum, the estimated liabilities during the ten years ending 1900 only averaged £6,902,979 per annum. But during the latter period there was a further estimated annual liability of £4,986,399 on private arrangements entered into outside of the Bankruptcy Act by insolvent debtors. There are no means of ascertaining the corresponding amount of liabilities on private arrangements outside of the Bankruptcy Acts prior to 1883, and therefore a complete comparison is impossible; but it is evident that on any method of computation there has been a very great diminution in the trading insolvency of England and Wales, while it is also clear as a matter of general knowledge in commercial circles, that a great decrease in the proportion of fraudulent trade and reckless speculation has been a marked feature of private trading during the period in question.

The cost of bankruptcy administration under the Act is provided for: (1) by fees charged to bankrupt estates, which for the year ended 31st March 1900 amounted to £111,874; (2) by interest on balances at the credit of such estates with the bankruptcy estates account, a portion of which invested in public securities yielded for the same year an income of £20,400; and (3) by interest on unclaimed funds at the credit of estates under former Bankruptcy Acts, which yielded £37,746; the total revenue of the department for the year 1900 being thus £170,020. Out of this were paid the salaries of all the officers of the department, including the official receivers; the remuneration due in respect of bankruptcy services to the county court registrars; pensions, &c., payable to retired officers under the present and previous Bankruptcy Acts; cost of bankruptcy prosecutions; and rents, stationery, travelling, and other incidental expenses; the total expenditure amounting for the year ended March 1900 to £160,901. The system is thus self-supporting, and involves no charge upon the tax-payers of the country. It has been objected that inasmuch as the Act professes to be based on the principle of enforcing commercial morality in the interests of the general community, the cost of administering it should not be charged entirely to the bankruptcy estates concerned. But when it is considered that the revenue of the department, to the extent of £37,746, is derived from funds to which estates administered under the present Act have contributed nothing, this objection does not appear to be well founded.

For the convenience of readers who may require more detailed information, the accompanying summary of the leading provisions of the law relating to bankruptcy procedure is submitted. It must be borne in mind, however, that the subject is in some of its branches extremely intricate, and that both the law and the procedure are being constantly affected by a considerable body of judicial interpretation. A reference to the latest text-books or competent professional advice will always be advisable for those who have the misfortune to be practically interested either as debtors or as creditors in bankruptcy proceedings.

The "Deeds of Arrangement Act, 1887," although not falling strictly within the scope of the bankruptcy law, may also, in consequence of its important bearing upon

the question of insolvency in England and Wales, be here noticed. It has been pointed out that, under the Bankruptcy Acts of 1849 and 1861, non-official arrangements by deed between a debtor and the general body of his creditors were not only officially recognized, but were in certain circumstances made binding on all the creditors, including those who refused to assent to them. Under the Act of 1869, although such deeds were no longer recognized or made binding on non-assenting creditors, the proceedings under the "liquidation by arrangement" and "composition" clauses were practically private arrangements by resolution instead of deed, and were proved by experience to be open to the same abuses. It has also been shown that under the Act of 1883 no arrangements either by deed or by resolution have any force against dissenting creditors, unless confirmed after full investigation and approval by the bankruptcy courts. Private arrangements, therefore, cease to form any part of the bankruptcy system. But they are, nevertheless, binding as contracts between the debtor and such creditors as assent to them. Being, however, in the nature of assignments of the debtor's property, they are either deemed fraudulent if the benefit of the assignment is limited to a portion of the creditors, or, if it is extended to all they become acts of bankruptcy, and, like any other voluntary assignment, are liable to be invalidated if made within three months prior to the petition on which a receiving order is made against the debtor. Treated as voluntary assignments, which are not binding on those who do not assent to them, such arrangements, where honestly entered into and carried out by capable administration, in many cases form a useful and expeditious method of liquidating a debtor's affairs, and where the debtor's insolvency has been brought about without any gross misconduct they will probably always be largely resorted to. The danger attending them is that even in cases where the debtor has been guilty of misconduct, a private arrangement may be used to screen his conduct from investigation, while in many cases it may be made the medium for the concealment of fraudulent preferences. The absence of any independent audit of the trustees' accounts may also encourage or conceal irregularities in administration. Previous to 1887, however, much inconvenience arose from the fact that the execution of these private arrangements was frequently kept secret, and fresh credit was obtained by the debtor without any opportunity being afforded for the new creditors becoming acquainted with the fact that they were dealing with an insolvent person, and that in many cases they were simply supplying the means for meeting past obligations in respect of which the debtor had already committed default. The "Deeds of Arrangement Act, 1887," was therefore passed to compel the disclosure of such arrangements, by declaring them void unless registered within seven days after the first execution by the debtor or by any creditor. Registration is effected by lodging with the Registrar of Bills of Sale at the central office of the supreme court a true copy of the deed, and of every inventory and schedule attached thereto, together with an affidavit by the debtor, stating the total estimated amount of property and liabilities, the total amount of composition if any, and the names and addresses of the creditors. Where the debtor's residence or place of business is outside the London bankruptcy district, the registrar is required to forward a copy of the deed to the registrar of the county court of the district where the debtor's residence or place of business is situated. Both the central and the local registers are open to public inspection on payment of a small fee, and general publicity is secured by the action of various

Deeds of arrangement.

Revenue and expenditure.

Summary of procedure.

trade agencies, which make a practice of extracting and publishing the information for the benefit of those interested. By section 25 of the Bankruptcy Act, 1890, every trustee under a deed of arrangement is required to transmit to the Board of Trade within thirty days of the 1st of January in each year an account of his receipts and payments, and such accounts are open to the inspection of any creditor on payment of a small fee. The registrar is also required to make periodical returns of the deeds thus registered to the Board of Trade, in order that a report of proceedings under the Deeds of Arrangement Act may be included in the annual report which the department is required to make on proceedings under the Bankruptcy Acts. Full statistics of such proceedings are accordingly included in these reports, from which it appears that during the ten years ended 31st December 1900 the total number of registered deeds of arrangement was 33,688, with estimated liabilities amounting to £49,863,989, and estimated assets to £25,673,159.

SUMMARY OF BANKRUPTCY PROCEDURE.

Subject to certain special provisions in the case of what are termed "small bankruptcies" (see below), the following summary sets forth the leading provisions of the various acts and rules relating to bankruptcy administration grouped under convenient heads to facilitate reference. In some cases the effect of legal decisions has been embodied in the summary.

Preliminary Proceedings.

Petition and Receiving Order.—Any court exercising bankruptcy jurisdiction in the district in which he resides or carries on business in England or Wales may make a receiving order against a debtor, whether a trader or not, either on his own petition or on that of a creditor or creditors whose claims aggregate not less than £50. In the case of a creditor's petition proof must be given of the debt, and of the commission of an act of bankruptcy within three months preceding the date of the petition. An act of bankruptcy is committed if the debtor fails to satisfy the creditor's claim upon a bankruptcy notice; if he makes an assignment for the benefit of his creditors generally; if he absconds or keeps house; if he gives notice of suspension of payments; if his goods are sold or seized under execution; if he files in court a declaration of inability to pay his debts; or if he grants a fraudulent preference or conveyance. These acts are here enumerated in the order in which they most frequently occur in practice.

Object and Effect of Receiving Order.—The object of the order is to protect the debtor's property until the first meeting of creditors, and to bring the debtor and his affairs within the jurisdiction of the court. Its effect is to stay all separate action against the debtor, and to constitute the Official Receiver attached to the court receiver of the debtor's property, although the legal title still remains in the debtor. Where there is an estate or business to be managed the Official Receiver may appoint a special manager, who receives such remuneration as the creditors, or failing them the Board of Trade, may determine. As a consequence of the order the following obligations are imposed upon the debtor:—He must make out and submit to the Official Receiver within a prescribed period a statement of his affairs, containing the names and addresses of his creditors, the amount of their claims and the securities held by them, and the nature and value of his assets; and accounting for his deficiency. Any material omission or false statement of his losses or expenses is a misdemeanour under the Debtors Act, unless he can prove that he had no intention to defraud. The statement is open to the inspection of creditors. He must also in every case submit to a public examination in court, in which the Official Receiver, the trustee, and any creditor who has proved his debt may take part. His evidence may be used against him. He may further be specially examined by the court at any time with reference to his dealings or property. He must attend the first meeting of creditors, wait upon the Official Receiver, trustee, and special manager, and give all necessary information, and generally do all acts which may reasonably be required of him with the view of securing a full investigation of his affairs. He may be arrested if there is reasonable ground for believing that he is about to abscond, destroy papers, or remove goods, or if he fails without good cause to attend any examination ordered by the court. The court may also for a period of three months order his letters to be readdressed by the Post Office to the Official Receiver or trustee. With regard to persons other than the debtor, any person capable of giving in-

formation respecting the debtor, his dealings or property, may be examined by the court, and a summary order may be made against such person for delivery of any property belonging to the debtor.

First Meeting of Creditors.

This meeting is summoned by the Official Receiver, notice being given in the *London Gazette* and in a local paper, and sent by post to each creditor. A summary of the statement of affairs should accompany the notice, with any observations by the Official Receiver which he may think fit to make. The object of the meeting is to decide whether any proposal for payment of a composition or for a scheme of arrangement submitted by the debtor is to be entertained, or whether an application should be made to the court to adjudicate the debtor bankrupt. In the latter case the meeting may by an ordinary resolution appoint a trustee with or without a committee of inspection. It may also give any directions as to the administration of the estate. The meeting should be held at the place most convenient for the majority of the creditors. It is presided over by the Official Receiver or his deputy, who, subject to appeal to the court, admits or rejects proofs for the purpose of voting. For the transaction of business three creditors qualified to vote, or all the creditors if fewer than three, must be present or represented. Only persons who have proved their debts are entitled to vote, and detailed regulations respecting proofs and the valuation of securities are laid down in the first and second schedules to the Act of 1883. One of the chief alterations in the law on this point is the condition imposed on creditors on bills of exchange to deduct from their claims the value of the liability of prior obligants before voting, thus cancelling the power of controlling the proceedings previously possessed by persons who had no real interest in the estate. Votes may be given in person or by proxy, and stringent regulations are laid down with the view of preventing the abuse of proxies. General proxies entitling the holder to exercise all the powers which the creditor could exercise if present, may be given to the Official Receiver, or to any person in the regular employment of the creditor. Special proxies may be given to any person to vote for specified resolutions, or for the appointment of specified persons as trustee and committee. Only official forms can be used, and the blanks must be filled up in the handwriting of the creditor or some person in his regular employment, including the authorized agent of a creditor resident abroad. A proxy must be lodged with the Official Receiver not later than four o'clock on the day before the meeting or adjourned meeting at which it is to be used. Resolutions are ordinary, special, or extraordinary. An ordinary resolution is carried by a majority in value of the creditors voting; a special resolution by a majority in number and three-fourths in value of such creditors. The only instance of a resolution other than these is that required for the approval of a composition or scheme which requires a majority in number and three-fourths in value of all the creditors who have proved. The majority of questions arising at a meeting are decided by an ordinary resolution.

Adjudication.

If the creditors so resolve, or if a composition or scheme of arrangement is not proposed by the debtor, or entertained by the creditors, or if entertained, is not approved by the court, or if without reasonable excuse the debtor fails to furnish a proper statement of his affairs, or if his public examination is adjourned *sine die*, the court adjudicates the debtor bankrupt, and thereupon his property vests in a trustee, and, subject to the payment of the costs and fees of administration, is divisible among his creditors, until all his debts are paid in full with interest at the rate of four per cent. per annum.

Effect on Bankrupt.—The bankrupt is bound to aid the trustee in his administration, and if he wilfully fails to deliver up any part of his property he is guilty of contempt of court. He is also liable to criminal prosecution under the Debtors Act, if with intent to defraud he conceals or removes property to the value of £10 or upwards; or if he fails to deliver to the trustee all his property, books, documents, etc.; or if he knowingly permits false debts to be proved on his estate without disclosure; or mutilates, falsifies, destroys, or parts with books or accounts; or attempts to account for his property by fictitious losses; or if within four months next before presentation of a bankruptcy petition, he obtains property on credit by false representation; or pledges or disposes of, otherwise than in the ordinary way of his trade, any property which has not been paid for; or by misrepresentation obtains the assent of his creditors to any agreement with reference to his affairs. He is also, under the Act of 1883, guilty of misdemeanour if before his discharge he obtains credit for more than £20 from any person without informing such person that he is an undischarged bankrupt. It is the duty of the Official Receiver to report any such facts to the court, and, if the court is satisfied that there is a reasonable probability of the victim, it is required to order a prosecution which is then con- Official at any

Disqualifications.—A bankrupt cannot during his bankruptcy, or until five years after his discharge, unless the bankruptcy is annulled, or he obtains his discharge with a certificate by the court that the bankruptcy was caused by misfortune without misconduct, act as a member of the Legislature, or as a justice of the peace, mayor, alderman, councillor, guardian or overseer of the poor, member of a sanitary authority, school, highway, or burial board, or select vestry in any part of the United Kingdom.

Annulment.—An order of adjudication may be annulled if the court is of opinion that it should not have been made, or that the bankrupt's debts are paid in full, or if a composition or scheme of arrangement is approved by the court after adjudication.

Discharge.—The court may also at any time after the conclusion of the bankrupt's public examination, and after hearing the Official Receiver, the trustee, and any creditor, to all of whom previous notice of the application must be given, grant the bankrupt a discharge either absolutely or under conditions, but subject to the following qualifications, viz.: (1) If the bankrupt has committed a criminal offence connected with the bankruptcy, the application must be refused unless for special reasons the court determines otherwise. (2) If the assets are not equal in value to ten shillings in the pound of the unsecured liabilities (unless the bankrupt can show that he is not responsible); or if proper books have not been kept; or if the bankrupt has traded after knowledge of insolvency; or has contracted debts without reasonable probability of payment; or failed to account for his deficiency; or contributed to the bankruptcy by rash speculation, gambling, culpable neglect, or by unjustifiable expenses; or has taken or defended legal proceedings on frivolous grounds; or has within three months preceding the receiving order given an undue preference; or has increased his liabilities with the view of making his assets equal to ten shillings in the pound; or has previously been bankrupt, or made an arrangement with creditors; or has been guilty of any fraud or fraudulent breach of trust; then the court shall, on proof of any of these facts, either (a) refuse the discharge, or (b) suspend it for a period of not less than two years, or until a dividend of not less than ten shillings in the pound has been paid; or (c) qualify the order by the condition that judgment is entered up against the bankrupt for payment of any unpaid balance of his debts, or any part of such balance out of his future earnings or property. The bankrupt may, however, after two years apply to the court to modify the conditions if he is unable to comply with them. An order of discharge releases the debtor from all his obligations, except debts due to the Crown, and other obligations of a public character which can only be discharged with the consent of the Treasury, debts incurred by fraud, and judgment debts in an action for seduction or as a co-respondent in a matrimonial suit or under an affiliation order, which are only released to such extent and subject to such conditions as the court may expressly order. The release of the bankrupt does not operate as a release of any partner or of co-obligant with him. Neither does it release the bankrupt from liability to criminal prosecution.

Composition or Scheme of Arrangement.

After a receiving order has been made the debtor may submit a proposal for the payment of a composition, or for the liquidation of his affairs, by a trustee or otherwise, without adjudication. The proposal must be lodged with the Official Receiver in sufficient time to allow notice, together with a report by that officer, to be sent to the creditors before the meeting is held at which it is to be considered. If the proposal is entertained at the meeting by a majority in number and three-fourths in value of all the creditors who have proved their debts, and if it is thereafter approved by the court, it becomes binding upon all creditors who would be bound by an order of discharge had the debtor been adjudicated bankrupt. A similar proposal may be made after adjudication, and if entertained by the creditors and approved by the court, the adjudication may be annulled. The debtor's release will be subject to the terms of the scheme, but his future acquired property will not pass to the creditors unless there is an express stipulation to that effect. If default is made in carrying out the scheme, or if it is found that it cannot proceed without injustice or undue delay, the court may at any time adjudicate the debtor bankrupt, in which case the scheme will fall to the ground, except in respect of past transactions under it. The approval of a composition or scheme does not release the debtor from his liabilities under the criminal law, nor from the necessity of undergoing a public examination which must, in fact, be held and concluded before the approval of the court is applied for. Also before such approval is given a report must be filed by the Official Receiver upon its terms and on the conduct of the debtor, and the court must be satisfied after hearing that officer and any creditor, that the proposal is reasonable and calculated to benefit the creditors, and no criminal offences connected with the bankruptcy have been committed by the debtor. Further, if any fact is proved which would have prevented the debtor from obtaining an absolute order of discharge had he been adjudged bank-

rupt, the composition or scheme cannot be approved unless it provides reasonable security for the payment of not less than seven shillings and sixpence in the pound on all the unsecured debts. Where a trustee is appointed to carry out the composition or scheme, all the provisions of the Act with reference to the remuneration of the trustee, the custody of funds, the audit of his accounts, and the control exercised by the Board of Trade, apply in the same manner as they would under an adjudication. Further, the provisions relating to the administration of property, proof of debts, dividends, &c., will also apply, so far as the nature of the case and the terms of the arrangement admit.

Property divisible among the Creditors.

No part of the law of bankruptcy is more intricate, or has been the subject of more litigation than this, and any detailed view of the effect of legal decisions can only be gathered by a perusal of the cases; but the following general principles may be stated:—The term "property" includes not only property of which the bankrupt is the true owner, but property in his possession, order, or disposition in his trade or business with the consent of the true owner, in such circumstances that he is the reputed owner thereof. The application of the doctrine of reputed ownership has been considerably restricted in recent years by the growth of alleged trade customs, in accordance with which property is frequently lent under a contract of "hire and purchase," or otherwise; and by the decisions of the courts that where such custom is sufficiently proved the doctrine does not apply. Further, the trustee's title not only includes property in the actual possession of the bankrupt, but relates back to the date of the first act of bankruptcy committed by him within the three months preceding the presentation of the bankruptcy petition, and thus invalidates all payments and assignments to creditors made during that period with knowledge on the part of the creditor or assignee of the commission of the act of bankruptcy. In such cases the trustee may, therefore, require the money or property to be restored to the estate. And even where no prior act of bankruptcy is proved, any payment made to a creditor with the view of giving such creditor a preference over the other creditors, within the three months preceding the presentation of the petition on which the payer is made bankrupt, is rendered void as against his trustee. Settlements of property within the two years preceding the bankruptcy, unless made before and in consideration of marriage, or made in good faith for valuable consideration, are also void, as are similar settlements within ten years, unless it is proved that the settlor was (independently of the settled property) solvent at the date of the settlement, and that the interest in the property passed to the trustees on the execution of the deed. The same rule applies to covenants to settle in consideration of marriage future acquired property in which the debtor had no interest at the date of the marriage (other than property acquired by the bankrupt through his wife), if such property is not actually transferred before the bankruptcy. Executions by a creditor not completed at the date of the receiving order are also void, and the proceeds of an execution in the hands of the sheriff must, with certain exceptions, and subject to deduction of costs, be handed over to the trustee. But all property held by the bankrupt on trust, and tools of trade, wearing apparel and bedding to a total value not exceeding £20, are excluded from the property divisible among the creditors. With respect to property acquired by the bankrupt, whether by gift or legacy, or consisting of accumulations of business or other profits after the commencement of the bankruptcy, and before he obtains his discharge, the trustee's title also prevails; but *bonâ-fide* transactions by the debtor for value, other than transactions relating to freehold property, appear to be valid. Where the bankrupt is a beneficed clergyman the trustee may, subject to certain provisions for the due discharge of the duties of the office, apply for the sequestration of the profits of the benefice; and where he is in receipt of a salary, income, or pension, etc., the court may order any part thereof to be paid to the trustee, but where he is an officer of the army, navy, or civil service, such order is only to be made with the consent of the chief of the department concerned.

Claims of Creditors and Dividends.

In the distribution of the debtor's property certain claims are entitled to priority over others. Thus the landlord, although not entitled to a preference out of the funds in the hands of the trustee, can distrain for unpaid rent on the goods and effects of the debtor remaining on the landlord's premises, but where the distraint is levied after the commencement of the bankruptcy this right is limited by the Act of 1890 to six months' rent due before adjudication, the remainder of his claim ranking for dividend with the claims of other creditors. Various gas and water companies have also statutory powers of distraint under special Acts, but the policy of recent legislation has been to discourage any extension of such privileges. Where the bankrupt holds an office of trust in any

savings bank or friendly society, any balance in his hands due to such bank or society has been held under the Acts relating to these bodies to be payable in preference to any other claim against the estate. Other preferential claims are regulated by the Bankruptcy Acts and by the Preferential Payments in Bankruptcy Act of 1883, and include taxes, parochial and other local rates for not more than one year, wages and salaries for four months, but not exceeding £50 [limited in the case of ordinary labourers and workmen to two months' wages not exceeding £25], and agricultural labourers' claims not exceeding one year's wages, if hired by special contract for payment of a lump sum at the end of a year. These claims are entitled to preference not only over funds in the hands of the trustee, but also over the proceeds of any distraint levied by the landlord within the three months prior to the receiving order, the latter in that case becoming a preferred creditor for the amount so paid. Articled clerks and apprentices may also be allowed repayment of a proportion of the premium on their unexpired agreements. On the other hand, usual trade discounts (exceeding 5 per cent.) must be deducted from traders' proofs, and the following claims are postponed until the general creditors are paid in full, viz., claims by a married woman for loans to the husband for the purposes of his business, claims for loans advanced to any person in business at a rate of interest varying with the profits, and claims for interest in excess of 5 per cent. per annum. Subject to these exceptions all debts proved in the bankruptcy must be paid *pari passu*. Any surplus after payment of 20s. in the pound and interest at the rate of 4 per cent. per annum, from the date of the receiving order, is payable to the bankrupt.

Proofs of Debt.—All claims and liabilities present or future, certain or contingent, arising out of obligations incurred before the date of the receiving order are provable in the bankruptcy, an estimate of the liability in the case of contingent debts being made by the trustee subject to appeal to the court. But demands in the nature of unliquidated damages arising otherwise than by reason of a contract, promise, or breach of trust, are not provable. A secured creditor if he proves must either surrender his security, or value the security and prove for the balance; and the trustee can thereupon, subject to the creditor's power in certain circumstances to amend the valuation, take over the security by paying the amount of the valuation, or may require it to be realised. He may be required by the creditor to elect which of these courses he will adopt, failing which the equity of redemption will vest in the creditor. For further regulations as to proofs, the time within which they must be lodged for voting and for dividend, and the manner of dealing with them, reference should be made to the first and second schedules of the Act of 1883 and the rules connected therewith.

Dividends.—After payment of costs of administration and preferential debts, it is the duty of the trustee to distribute the estate with all convenient speed,—the first dividend within four months after the first meeting of creditors, and subsequent dividends at intervals of not more than six months, but the declaration may be postponed for sufficient reason by the committee of inspection. Notice of the intention to declare a dividend is gazetted and sent to each creditor mentioned in the bankrupt's statement of affairs who has not proved. The notice should state the last day for proving in order to participate in the distribution, and should be given not more than two months before the declaration. When the dividend is declared, notice of the amount due, and where the same is payable, is sent to each creditor who has proved, with a statement showing particulars of the estate. And provision must be made for creditors at a distance, who have not had time to prove, for disputed claims, and for debts the subject of claims not yet determined. Creditors who fail to prove before the declaration of a dividend are entitled to receive their dividends on proving before any subsequent dividend is declared, but cannot disturb the distribution of any dividend already declared. Before distributing a final dividend notice is sent to every creditor whose claim has been notified to the trustee, but not finally established, with an intimation that unless so established within a specified period he will be excluded from participation in the estate. In the case of a bankrupt firm the joint creditors are not entitled to receive a dividend out of the separate property of the bankrupts until all the separate creditors are paid in full.

Trustee's Administration.

While the interim preservation and management of the estate is conducted by or under the direct supervision of officers appointed by and responsible to the Board of Trade, the ultimate realization and distribution of the assets devolve upon the trustee appointed by the creditors. But besides acting as receiver prior to the first meeting of creditors, the Official Receiver also becomes trustee by operation of law on the making of an order of adjudication. He vacates the office when a trustee is appointed by the creditors, and certified by the Board of Trade, but again becomes trustee on the creditors' trustee being released, dying, resigning, or being removed

from office. As the bankrupt's property vests in the trustee for the time being, and passes from trustee to trustee by operation of law, and without any formal act of conveyance, the continuity of the office is thus secured.

Appointment of Trustee.—A trustee may be appointed by a majority in value of the creditors voting, at the first or any subsequent meeting, or the appointment may be left to the committee of inspection. In either case the appointment is subject to confirmation by the Board of Trade, who may object on the ground that the creditors have not acted in good faith in the interests of the general body, or that the person appointed is not fit to act, or occupies such a position in relation to the debtor, to any creditor, or to the estate, as makes it difficult for him to act with impartiality, or that in any previous case he has been removed from office for misconduct or for failure without good cause to render his accounts for audit. An appeal from such objection to the High Court lies at the instance of a majority in value of the creditors, but in the absence of an appeal it is fatal to the appointment. Before being confirmed, the trustee-elect must also furnish security to the satisfaction of the Board of Trade, and such security must be kept up to the amount originally fixed, or to such lesser amount as that department may require, throughout the tenure of the trusteeship, failing which the trustee is liable to be removed from office. Where the creditors fail to appoint a trustee, the Board of Trade may do so, but such appointment may at any time be superseded by the creditors.

Removal.—The trustee may be removed by the creditors at a meeting summoned for the purpose without reason assigned, or by the Board of Trade for misconduct, or for incapacity or failure to perform his duties, or on either of the other personal grounds of objection to which the appointment is open. But the removal is in like manner subject to appeal at the instance of creditors. If a receiving order is made against a trustee he thereby vacates office. He may also, with the consent of a general meeting of creditors, resign, but his resignation does not operate as a release from his liability to account for his administration.

Powers and Duties.—The trustee is required to take immediate possession of the bankrupt's property, including deeds, books, and accounts, and has the powers of a receiver in the High Court for the purpose of enforcing delivery. After payment of the costs of administration it is his duty to distribute the estate in dividends as speedily as possible. He may also, and with the sanction of the committee, or where there is none, with that of the Board of Trade, carry on the business so far as is necessary to a beneficial winding up, institute or defend legal proceedings, employ a solicitor to do any business previously sanctioned by the same authority, compromise debts and claims, raise money on mortgage, sell property on credit, or divide the estate where practicable among the creditors in its existing form. He may, without special sanction, but subject to any directions which may be given by the creditors in general meeting, or failing them, by the committee, sell the property or any part of it for cash, including business goodwill and book debts, and either by public auction or private treaty, and generally exercise all the powers which the bankrupt might before adjudication have exercised in relation to the property, or which are by the Bankruptcy Act conferred on the trustee.

Where any part of the property is held subject to onerous obligations, such as the payment of rent, etc., the trustee may disclaim the same, subject in certain cases to the leave of the court, and the disclaimer operates to determine all interest in or liability in respect of the property on the part of the estate. The trustee is required to keep a Record book (which is commenced by the Official Receiver), containing minutes of the proceedings in the bankruptcy, and a Cash book in the prescribed form, in which all receipts and payments by him must be entered. All monies received must forthwith be paid into an account at the Bank of England, entitled the "Bankruptcy Estates Account," which is under the control of the Board of Trade, unless where in special circumstances the sanction of that department is obtained to the opening of a local banking account, but in no circumstances must estate monies be paid to the trustee's private account. When monies are required for the purpose of the estate, special cheques or money orders are issued by the Board of Trade on the application of the trustee.

Control over Trustee.—In his administration of the estate the trustee is subject to control by the committee of inspection, the creditors, the court, and the Board of Trade. The committee is appointed by the creditors, and must consist of not more than five nor less than three creditors, or authorized representatives of creditors. It acts by a majority present at a meeting, and should be convened once a month unless it otherwise directs. If no committee is appointed, the Board of Trade may give any direction or permission which might have been given by a committee. Directions given by the committee, if not inconsistent with the provisions of the Act, are binding on the trustee, unless contrary to or overruled by those of the creditors or of the court. The Official Receiver or trustee may summon a meeting of the creditors at any

time to ascertain their wishes, and must do so when so required by one-sixth in value of the creditors, or when directed by the court. The Board of Trade may also direct the Official Receiver to summon a meeting for the purpose of reviewing any act done by the trustee or any resolution of the committee of inspection. Further, the trustee may apply to the court for directions in any particular matter, and the court may also, on the application of any person aggrieved, reverse or modify any act of the trustee, or make such order as it deems just. The directions of the court override those of the creditors. The Board of Trade is required to take general cognizance of the conduct of trustees, to inquire into any complaints by creditors, and in the event of any trustee not faithfully performing his duties, to take such action, including the power of removal, as may be expedient. It may also direct a local investigation of the trustee's books and accounts, and may require him to answer any inquiries, or may apply to the court to examine him on oath. If any loss has arisen to the estate from any misfeasance, neglect, or omission of the trustee, it may require him to make it good. The orders of the Board of Trade under the powers conferred by the Act may be enforced by the court by committal of the trustee or otherwise.

Audit of Accounts.—The trustee's accounts must be audited by the committee of inspection not less than once in every three months; and once in every six months, as well as at the close of the administration, the record and cash books must also be submitted with the vouchers, and the committee's certificate of audit to the Board of Trade for final audit. If it appears that the trustee has retained more than £50 in hand for more than ten days without a satisfactory explanation, he may be removed from office, surcharged with interest at the rate of 20 per cent. per annum, and lose all claim to remuneration.

Remuneration.—The trustee's remuneration is fixed by the creditors, or by the committee if so authorized by them. It must be in the nature of a percentage on the amount of the realizations and on the dividends. If one-fourth of the creditors in number or value dissent from the resolution, or if the bankrupt satisfies the Board of Trade that the remuneration is excessive, the Board may review the same and fix the remuneration. A trustee may not receive any remuneration for services rendered in any other capacity, e.g., as solicitor, auctioneer, etc. beyond that voted to him as trustee; nor may he share his remuneration with the bankrupt, the solicitor, or other person employed about the bankruptcy; or receive from any person any gift, or other pecuniary or personal benefit in connection therewith.

Costs.—A trustee receiving remuneration is not allowed the costs of any other person in respect of duties which ought to be performed by himself. All bills of solicitors and other agents employed must be taxed before payment, as being in accordance with the prescribed scales of costs; and the taxing master must satisfy himself that the employment has been properly authorized before the work was done. All bills of costs must be delivered to the trustee within seven days of the request for the same, otherwise the estate may be distributed without regard to such costs.

Release.—When the property, so far as it is capable of realization, has been realized and distributed, the trustee must apply to the Board of Trade for his release, forwarding to each creditor a notice of his having done so, together with a copy of his final accounts, and the Board of Trade, after preparing and considering a report on the same, and the objections of any person interested, may, subject to appeal to the High Court, grant or withhold the release. If a release is withheld, the court may, on the application of any person interested, make such order against the trustee as it thinks just. The release when granted operates as a removal from office, and thereupon the Official Receiver again becomes trustee, and is thus in a position, even after the nominal close of the bankruptcy, to deal with any circumstances which may arise, or which have not been foreseen and provided for.

Small Bankruptcies.

When the Official Receiver reports, or the court is otherwise satisfied that the debtor's property is not likely to realize more than £300, the court may make an order for the summary administration of the estate, in which case, if the debtor is adjudged bankrupt, the Official Receiver in the ordinary course becomes and remains trustee, and certain other modifications are effected with the view of simplifying and accelerating the procedure. The chief of these modifications are as follow, viz., the Board of Trade acts as committee of inspection; there is no advertisement of the proceedings in a local paper; in legal proceedings all questions of law and fact are determined by the court without a jury; adjudication may be made on a report by the Official Receiver before the first meeting of creditors, where no composition or scheme is proposed; meetings of creditors may be held in the town where the court sits or the Official Receiver's office is situated; notice to creditors of meetings other than the first meeting, or of application by a debtor for his discharge, are dispensed with in the case of creditors for amounts not exceeding £2. Costs, other than a solicitor's charges,

may be paid without taxation; and the time for declaring the first dividend is extended to six months, but the whole estate must be realized and distributed within this period if practicable. No modification, however, is permitted in the procedure relating to the public examination and discharge of the bankrupt. Notwithstanding that an order has been made for summary administration, the creditors may at any time by a resolution passed by a majority in number and three-fourths in value of those voting at the meeting, appoint a trustee in place of the Official Receiver, in which case the summary order ceases to be operative.

Scottish Bankruptcy Legislation.

Since the publication of the ninth edition of this work some important changes have taken place in the law of bankruptcy in Scotland, although the main features of that law, as embodied in the Act of 1856, remain substantially untouched. Among the less important alterations may be mentioned those effected by the Bankruptcy and Real Securities Act of 1857, which deals with the costs of competition for trusteeships; the Bankruptcy Amendment (Scotland) Act, 1860, which enables the Court to recall a sequestration where it is more convenient that the estate should be wound up in England or Ireland; and the Bankruptcy Amendment Act (Scotland), 1875, which makes the wages of clerks, shopmen, and servants preferential claims for a period not exceeding four months and an amount not exceeding £50, while the claims of workmen are placed on a similar footing for a period not exceeding two months. One of the principal modifications is that effected by the Debtors (Scotland) Act of 1880, which abolished imprisonment for debt, but which, like its English prototype (the Debtors Act of 1869), contains a series of important provisions for the punishment of fraudulent bankrupts. Under these provisions the laws of the two countries on that subject are practically assimilated, although some minor differences still survive. One of the most important of these differences is, that while the Scottish Act makes the failure, within the three years prior to the sequestration, to keep "such books and accounts as, according to the usual course of any trade or business in which he (the debtor) may have been engaged, are necessary to exhibit or explain his transactions" a criminal offence, the English Act contains no provision of an analogous character; the non-keeping of such books being treated as a fact to be taken into account in dealing with the debtor's application for his discharge, but not coming within the scope of the criminal law. On the other hand, there are a few minor trading irregularities dealt with in the English Act which are not specifically included in that of Scotland. Another important distinction is that under the Scottish Act the same offences may be treated differently, according as they are brought for trial before the Court of Justiciary or a sheriff and jury, in which case the maximum penalty is two years' imprisonment; or before a sheriff without a jury, in which case the penalty is limited to imprisonment for a period not exceeding sixty days. This distinction admits of a useful elasticity in the administration of the law, having regard to the comparative importance of the case, which is hardly possible under the English Act.

Another most important modification of the law is effected by the Debtors Act of 1880, combined with the Bankruptcy and Cessio Act of 1881, and the Act of Sederunt anent Cessios of 22nd December 1882. Under the law existing prior to these enactments, the process of *cessio bonorum* operated chiefly as a means for obtaining release from imprisonment for debt on a formal surrender by a debtor of all his goods and estate. But under this process the debtor was not entitled to a discharge, and his future acquired property was still subject to diligence at the instance of unsatisfied creditors. By abolishing imprisonment for debt (except in regard to Crown debts,

and public rates and assessments), the Legislature also practically abolished this use of the process of *cessio*, and the process itself would probably have become obsolete, but for certain changes effected by the Act of 1881, which have given it a different and more extended scope. Among these changes may be noted (1) the extension to "any creditor of a debtor who is notour bankrupt," without reference to the amount of his debt, of the right, hitherto limited to the debtor himself, to petition the court for a decree of *cessio*, the prayer of the petition, whether presented by the debtor or by a creditor, being "to appoint a trustee to take the management and disposal of the debtor's estate for behoof of his creditors"; (2) the discretionary power given to the court upon such petition to award sequestration under the Bankruptcy Act, in any case where the liabilities of the debtor exceed £200; and (3) the right of the debtor to apply for his discharge under similar conditions to those obtaining in the case of sequestration. An important modification of the law relating to discharge which equally affects a debtor under the Bankruptcy and *Cessio* Acts, is also effected by the provision of the Act of 1881, which requires, in addition to the concurrence of creditors, the fulfilment of one of the following conditions—viz., "(a) That a dividend of five shillings in the pound has been paid out of the estate of the debtor, or that security for payment thereof has been found to the satisfaction of the creditors; or (b) That the failure to pay five shillings in the pound has, in the opinion of the sheriff, arisen from circumstances for which the debtor cannot justly be held responsible." Orders of *cessio* are only made in the Sheriff Courts, and when made, the court also appoints a trustee, who conducts the proceedings without the control exercised by the creditors in a sequestration. Under these conditions it will be seen that the original purpose and constitution of the process of *cessio* has entirely disappeared, and it has now become a modified form of official bankruptcy procedure, with a less elaborate routine than in the case of sequestration, and one perhaps more suitable to the smaller class of cases, to which in practice it is limited.

The Bankruptcy Frauds and Disabilities (Scotland) Act of 1884 applies to sequestrations and decrees of *cessio* the criminal provisions of § 31 of the English Bankruptcy Act of 1883, relating to the obtaining of credit for £20 and upwards by an undischarged bankrupt, without disclosure of his position. It also places the law relating to the disqualifications attaching to such bankrupts on a similar footing to that of the English Act.

The Judicial Factors Act of 1889 contains a provision calculated to check excessive costs of administration, by requiring that where the remuneration of a trustee under a sequestration is to be fixed by the commissioners, intimation of the rate of remuneration is to be given to the creditors and to the Accountant of Court before being acted on, and the latter officer is empowered, subject to appeal, to modify the same if he deems it expedient.

It may be pointed out that the Deeds of Arrangement Act of 1887, which applies to England and Ireland, does not apply to Scotland, and there is no analogous provision requiring registration of private deeds of assignment for the benefit of creditors as a condition of their validity in that country.

Finally, it is to be noted that the office of Accountant in Bankruptcy, which was established by the Bankruptcy Act of 1856, has under the Judicial Factors Act of 1889 been abolished, the duties being merged in those of the office of Accountant of the Court of Session.

Irish Bankruptcy Legislation.

With the exception of an Act passed in 1888 for estab-

lishing local Bankruptcy Courts in certain districts in Ireland, and an Act passed in 1889, applying the main provisions of the English Act of 1888, relating to preferential payments in bankruptcy, to Ireland, no material change has occurred in the Irish law of bankruptcy, which therefore continues to be regulated by the two leading Irish statutes of 1857 and 1872, together with the Irish Debtors Act, 1872, and corresponds in its main features to some of the older English enactments, with modifications adopted from the English Act of 1869. It may be pointed out, however, that the system of liquidation by arrangement and composition without the approval or control of the court, which proved fatal to the success of the latter, has not at any time been imported into the Irish law.

The Deeds of Arrangement Act of 1887, which has been already discussed above under the head of English bankruptcy legislation, also applies in its main provisions to Ireland, and as supplemented by the Irish Deeds of Arrangement Amendment Act of 1890, places the law relating to this branch of insolvency procedure upon a similar footing in both countries, so far as regards the publicity of such deeds. The last-mentioned Act also requires a similar registration of all petitions for arrangement under the Bankruptcy Act of 1857.

Bankruptcy Legislation in the British Colonies and India.

Since the passing of the English Bankruptcy Act of 1883, there have been numerous acts of legislation affecting the law of bankruptcy in the British Colonies. In some of these the principles of the English Act have been more or less closely followed, the main distinction being that the control and supervision which in England is vested in the Board of Trade and its officers, are in the Colonies vested in the local courts and specially constituted officials acting under their control. For general information on the subject of Colonial and Indian bankruptcy legislation down to a recent date, reference may be made to the Sixteenth Annual Report to Parliament by the Board of Trade, dated 1st August 1899, and to the subsequent annual reports of that department, which contain interesting *résumés* of the principal features of the various acts at present in force in the British Colonies and in India. (J. SM.)*

BANKRUPTCY IN THE UNITED STATES.

The United States Bankruptcy Law of 1867 was repealed in 1878. For the twenty years following, until 1898, the only insolvency laws in the United States were those of the separate States, in which there has been little change; they varied much, especially as to dissolving attachments and preferences and granting discharges. In 1898 these laws were again superseded by another general United States Bankruptcy Act.

The especial objects of this Act were the securing of discharges from debts to all insolvents not guilty of fraud, and promptness and economy in the settlement of estates. The provisions as to discharges from debts are much more liberal than in any former Act. Any bankrupt may have a discharge from his debts unless he has committed some crime punishable by imprisonment under the Act (viz., concealment of property or perjury), or with fraudulent intent and in contemplation of bankruptcy destroyed, concealed, or failed to keep books from which his true condition might be ascertained. No dividend to or consent of the creditors is required. A preference, or conveyance to defraud creditors, or spending or wasting of property, or loss by gambling before the adjudication, is no ground for refusing a discharge. Discharges do not affect the following:—taxes, judgments for frauds, false pretences, or wilful injuries; debts not scheduled; debts created by embezzlement or misappropriation, either as an officer or by one acting in a fiduciary capacity. Compositions approved by a majority in number and amount of the creditors, and confirmed by the judge, may be enforced; and the bankrupt, upon depositing the consideration for the composition, and money to pay the preferred

claims, and the costs of the proceedings, will be discharged. Jurisdiction of proceedings in bankruptcy is committed to the United States district court with the right of appeal in some cases to the circuit court of appeals and the supreme court. A jury may be demanded by the respondent in involuntary cases. The judges appoint referees for the different sections of their districts, and must appoint one for each county in which the services of a referee are needed. The referees have extensive judicial powers, and most of the proceedings are in practice conducted before the referees; but their orders are subject to revision by the judges. Judges only can grant discharges and confirm compositions; but the petitions are usually sent to the referees to report the facts with their recommendation. Any person, except a corporation, owing debts, may become a voluntary bankrupt. Involuntary petitions may be brought against any natural person, except a wage-earner or farmer, and any business corporation owing 1000 dollars. A wage-earner is defined to be one whose compensation does not exceed 1500 dollars per annum. Acts of bankruptcy are less in number than in former laws. They are, transferring property to delay or defraud creditors; making or permitting preferences; making a general assignment; admitting in writing inability to pay debts and willingness to be adjudged bankrupt. An adjudication in bankruptcy dissolves attachments and levies of execution, and avoids preferences, made within four months of the adjudication. A trustee to administer the estate is elected by a majority in number and amount of the unsecured creditors; the judge or referee may disapprove an appointment, but may appoint only when creditors fail to do so. The trustee takes, as of the time of adjudication, all property which a creditor, under the laws of the State, might appropriate. In partnership cases the creditors of the partnership elect the trustee, who administers the estates of the partnership and of the individual partners. The assets are marshalled, partnership assets being applied first to partnership claims and individual assets to individual claims. The bankrupt is allowed to retain all property exempt by the laws of the State in which he resides. These exemptions vary greatly—*e.g.*, from homesteads worth \$500 to those worth \$5000, and in about the same proportions as to personal property. Taxes, wages of labourers to the amount of \$300, earned within three months of the adjudication, and claims preferred by the laws of the State, are preferred in United States bankruptcy. Fees are very small.

As may be seen from the above summary, there are many differences between the law of 1867 and that of 1898. One distinction of importance concerns jurisdiction of suits by trustees. A trustee can only sue where the bankrupt could have sued—that is, usually, only in the State courts. A suit to recover property fraudulently conveyed by the bankrupt to one in the same State cannot be brought in the district court unless the defendant consents. The law has worked well upon the whole, and an association of referees in bankruptcy has recommended to Congress several amendments calculated to remove its objectionable features. The principal points of the amendments thus recommended are: (1) the adding of the following to the grounds for objecting to the granting of discharges—*viz.*, obtaining credit by false representations, making fraudulent preferences or transfers not restored, causing bankruptcy by gambling, destruction of books, refusing to obey orders made or to answer questions approved by the Court; (2) providing that discharges shall not affect liability for fraud or wilful injury, or for alimony, or support of family, or seduction; (3) increasing the compensation to trustees; (4) allowing corporations to become voluntary bankrupts; (5) shortening the time for involuntary proceedings; (6) giving the United States courts jurisdiction to set aside preferences and fraudulent transfers; (7) making definite the effect upon dividends of *bond-fide* payments on account within four months of the bankruptcy. These amendments and several others of less importance, when adopted, would make the Act of 1898 the most liberal, as well as the most economical, Bankruptcy Act which has ever existed in the United States

(H. G. N.)

Banks, Nathaniel Prentiss (1816-1894), American politician and soldier, was born in Waltham, Massachusetts, on the 30th of January 1816, and died

there on the 1st of September 1894. He was admitted to the bar, and, in 1849, was elected to the State Assembly, of which he was speaker in 1851 and 1852. In 1853 he was chairman of the state constitutional convention. In that year he was elected to the national House of Representatives, as a coalition-Democrat. He was re-elected by the "American" party, and after a long contest became Speaker of the House. In 1856 he was re-elected by the Republicans, but resigned, in 1857, to become governor of Massachusetts, to which office he was re-elected in 1858 and 1859. After serving for a short time as president of the Illinois Central Railroad, he became, in 1861, a major-general of volunteers in the Civil War. He performed conspicuous services in the army of the Potomac, and in the department of the Gulf of Mexico. He resigned his commission in 1864, and was again elected a representative in Congress, where he served almost continuously until 1877. For several years he held the important position of chairman of the Committee on Foreign Affairs. He was once more a member of the House from 1889 to 1891.

Bankura, a town of British India, in the Burdwan division of Bengal, situated on the left bank of the river Dhalkisor. Population, about 19,000. The town stands high, and is reckoned healthy. It has a high school, with 246 pupils in 1896-97, two printing-presses, one of which issues a weekly newspaper in the vernacular, and a Hindu public library.

The district of **BANKURA** lies partly in the plain and partly on the hills, its northern boundary being the river Damodar. It contains an area of 2621 square miles. Population (1881), 1,041,752; (1891), 1,069,668, showing an increase of 3 per cent.; average density, 408 persons per square mile. Hindus numbered 920,373; Mahommedans, 45,312; aborigines (chiefly Sonthals), 103,747; Christians, 132, of whom 21 were Europeans; "others," 104. In 1901 the population was 1,114,185, showing a further increase of 4 per cent. Land revenue and rates in 1897-98 were Rs.5,21,559; the number of police was 367; the boys at school in 1896-97 numbered 37,587, being 47.6 of the male population of school-going age; the registered death-rate (1897) was 26.7 per thousand. There are 14 indigo factories, with an out-turn valued at Rs.17,700. Large quantities of lac and tusser silk are gathered in the hilly tract, which is overgrown with jungle. The stone quarries and minerals are little worked. There are two coal mines, employing about 200 people, and producing about 9000 tons a year. Both cotton and silk are woven, and plates, &c., are carved from soap-stone. The district is exposed to drought, and also to destructive floods. It suffered in the famines of 1866, 1874-75, and again in 1896-97. The old capital of the country was at Bishnupur, which is still the chief centre of local industries. The north of the district is near the East Indian railway, beyond the river Damodar.

Bannu, a town and district of British India, in the Derajat division of the Punjab. The town (also called Edwardesabad and Dhulipnagar) lies in the north-west corner of the district, in the valley of the Kuram river. Population, about 6000. The municipal income in 1897-98 was Rs.52,781. The cantonments of Fort Dhulipnagar accommodate artillery, cavalry, and infantry. There are a missionary church, school, and printing-press, a Victoria Jubilee high school (opened in 1897), and a Mahommedan school.

The district of **BANNU**, stretching across both banks of the Indus, contains an area of 3847 square miles. The population in 1891 was 372,276, being 97 persons per

square mile. Classified according to religion, Mahomedans numbered 337,269; Hindus, 33,832; Sikhs, 1062; Christians, 58, including 39 Europeans; "others," 55. In 1901 the population was 403,072, showing an increase of 8 per cent. The total amount of land revenue and rates was returned as Rs.4,93,138, the incidence of assessment being $3\frac{1}{2}$ annas per acre; the number of police was 514. In 1896-97, out of a total cultivated area of 628,734 acres, 166,575 were irrigated, almost entirely from private canals. Salt is quarried on Government account at Kalabagh, and alum is largely obtained in the same neighbourhood. The chief export is wheat. The main line of the North-Western railway, with a branch now in process of extension northwards, runs for 93 miles through the cis-Indus tract; and a military road, 80 miles in length, leads from Bannu town towards Dera Ismail Khan. The Indus, which is nowhere bridged within the district, is navigable for native boats throughout its course of 76 miles. Education is making fair progress. In 1896-97 there were altogether 297 schools attended by 6029 boys, the proportion of boys at recognized schools to those of school-going age being 12 per cent. The death-rate in 1897 was 43 per 1000; the rainfall in 1897 was 20.23 inches.

Banswara, a native state of India, in the Rajputana agency, with an area of 1505 square miles. The population in 1891 was 180,916, showing an average density of 120 persons per square mile. The estimated gross revenue in 1896-97 was Rs.2,53,788; the tribute, Rs.38,000. The administration is in the hands of a Hamdar or minister. The petty state of KUSHALGARH is feudatory to Banswara; area, 432 square miles; population (1891), 31,353; gross revenue, Rs.61,977. In 1901 the population of the two states was 165,276, showing a decrease of 22 per cent., due to the effects of famine.

The town of BANSWARA has a population of about 7500.

Bantam, the most western residency of Java, on Bantam Bay, with its chief town of the same name, 45 miles west by north of Batavia. The soil is fertile only in the central portion of the residency, which, from several causes (cattle plague of 1879, fever epidemics, the eruption of Krakatao in 1883, causing the death of 24,000 of the inhabitants, and the insurrection of 1888), is less populous and less cultivated than the rest of Java. The industries are rice, coffee, *katjang*, and fishing. The capital is in a decayed state. The residency (area, 2989 square miles) had, in 1897, a population of 709,339, including 302 Europeans, 1959 Chinese, 54 Arabs, and 35 other Asiatic foreigners.

Bantry, a seaport in county Cork, Ireland, on Bantry Bay, which is one of the headquarters stations of the Channel Squadron and an important fishing centre. It is the terminal station of the Cork, Bandon, and South Coast Railway. The coaches on the famous Prince of Wales route to Glengarriff start from here. The manufacture of Irish friezes and tweeds is now successfully carried on; also salmon fishing. Population, about 2900.

Bantu Languages.—The greater part of Africa south of the equator possesses but one linguistic family so far as its native inhabitants are concerned. This clearly-marked division of human speech has been entitled the Bantu, a name invented by the late Dr Bleek, and it is, on the whole, the fittest general term to use to designate the most remarkable group of African languages.¹

¹ *Bantu* (literally *Ba-ntu*) is the most archaic and most widely spread term for "men," "mankind," "people," in these languages. It also indicates aptly the leading feature of this group of tongues, which is the governing of the unchangeable root by prefixes. The syllable *-ntu* is

It must not be supposed for a moment that all the people who speak Bantu languages belong necessarily to a special and definite type of Negro. On the contrary, though there is a certain physical resemblance among those tribes who speak the purest Bantu dialects (the Ba-yanzi of the Upper Congo, the people of the great lakes, the Ova-herero [Damara], Zulu-Kafirs, Awemba, and some of the east coast peoples), there is nevertheless a great diversity in outward appearance, shape of head, and other physical characteristics, among the negroes who inhabit Bantu Africa. Some tribes speaking Bantu dialects are dwarfs or dwarfish, and obviously akin to the non-Bantu Bushmen or Forest Pygmies. Others betray relationship to the Hottentots; others again cannot be distinguished from the most exaggerated forms of the black West African Negro. Yet others again, especially on the north, show traces of Galla or Nilotic intermixture. But the general deduction to be drawn from a study of the Bantu languages as they exist at the present day is that at some period not much more than two thousand years ago a powerful tribe of negroes speaking the Bantu mother language, and allied physically to the negroes of the Western Nile and Southern Lake Chad basins, pushed themselves forcibly into the southern half of Africa, which at that time was probably very sparsely populated except in the north-west, east, and south. The Congo basin at the time of the Bantu invasion would have been occupied on the Atlantic seaboard by west coast negroes, and in the centre by Forest Pygmies; the vicinity of Victoria Nyanza and the East African coast region down to opposite Zanzibar probably had a population partly Nilotic-negro and partly (in the south) Hottentot. From Lakes Tanganyika and Nyasa south-westwards to the Cape of Good Hope the population was Hottentot and Bushman. Over nearly all this area the Bantu swept with such a vehemence that they destroyed or absorbed the vast majority of the preceding populations, of which, linguistically speaking, the only survivors are the scattered tribes of pygmies in the forests of the Congo and Gabun, a few patches of quasi-Hottentot and Nilotic peoples between Victoria Nyanza and the Zanzibar coast, and the Bushmen and Hottentots of South-West Africa. The first area of decided concentration on the part of the Bantu was very probably Uganda and the shores of Tanganyika. The main line of advance south-west trended rather to the east coast of Africa than to the west. Finally, when the Bantu had reached the south-west corner of Africa, their further advance was checked by two causes: first, the concentration in a healthy, cattle-bearing part of Africa of the Hottentots (themselves only a superior type of Bushman, but able to offer a much sturdier resistance to the big black Bantu negroes than the crafty but feeble Bushmen), and secondly, the arrival on the scene of the Dutch and British, but for whose final intervention the whole of Southern Africa would have been rapidly Bantuized, as far as the imposition of language was concerned. The theory thus briefly set forth of the origin and progress of the Bantu, and the approximate date at which their great southern exodus commenced, is to some extent attributable to the present writer only, and has been traversed at different times by other writers on the same subject. In

nowhere found now standing alone, but it originally meant "object," or possibly "person." Combined with different prefixes it has different meanings. Thus (in the purer forms of Bantu languages) *muntu* means "a man," *bantu* means "men," *kinu* means "a thing," *bintu* "things," *kantu* means "a little thing," *tuntu* "little things," and so on. This term *Bantu* has been often criticized by writers, such as Sir H. M. Stanley, but no one has supplied a better, simpler designation for this section of the negro race and of negro languages, and the term has now been definitely consecrated by a use of over forty years.

the nearly total absence of any historical records, the only means of building up Bantu history lies in linguistic research, in the study of existing dialects, of their relative degree of purity, of their connexion one with the other, and of the most widely spread roots common to the majority of the Bantu languages. The present writer, relying on linguistic evidence, fixed the approximate date at which the Bantu negroes left their primal home, somewhere in the very heart of Africa (between the northern basin of the Congo, the western basin of the Nile, and the southern basin of Lake Chad), at not much more than two thousand years ago; and the reason adduced seems unanswerable. It lies in the root common to nearly all the Bantu languages expressing the domestic fowl—*kuku* (*nkuku*, *ngoko*, *nchuchu*, *nsusu*, *nguku*, *nkū*). Now the domestic fowl reached Africa first through Egypt, at the time of the Persian occupation—not before 500 to 400 B.C. It would take at that time at least a couple of hundred years before—from people to people and tribe to tribe up the Nile valley—the fowl, as a domestic bird, reached the very heart of Africa. The Muscovy duck, introduced by the Portuguese from Brazil at the beginning of the 17th century, is spreading itself over Negro Africa at just about the same rate. Yet the Bantu people must have had the domestic fowl well established amongst themselves before they left their primeval home, because throughout Bantu Africa (with rare exceptions, and those not among the purest Bantu tribes) the root expressing the domestic fowl remounts to the one vocable of *kuku*.¹ Curiously enough this root *kuku* resembles to a marked degree several of the Persian words for “fowl,” and is no doubt remotely derived from the cry of the bird. Among those Negro races which do not speak Bantu languages, though they may be living in the closest proximity to the Bantu, the name for fowl is quite different.² The fowl was only introduced into Madagascar, as far as researches go, by the Arabs during the historical period, and is not known by any name similar to the root *kuku*. Moreover, even if the fowl had been (and there is no record of this fact) introduced from Madagascar on to the east coast of Africa, it would be indeed strange if it carried with it to Cameroon, to the White Nile, and to Lake Ngami one and the same name. It may, however, be argued that such a thing is possible, that the introduction of the fowl south of the equator need not be in any way coincident with the Bantu invasion, as its name in North Central Africa may have followed it everywhere among the Bantu peoples. But all other cases of introduced plants or animals do not support this idea in the least. The Muscovy duck, for instance, is pretty well distributed throughout Bantu Africa, but it has no common widely-spread name. Even tobacco (though the root “*taba*” turns up unexpectedly in remote parts of Africa) assumes totally different designations in different Bantu tribes. The Bantu, moreover, remained faithful to a great number of roots like “fowl,” which referred to animals, plants, implements, and abstract concepts known to them in their original home. Thus there are the root-words for ox (*-buzi*), pig (*-gulu*), pigeon (*-jiba*), dog (*-mbwa*), hippo-

potamus (*-bugu*), elephant (*-jobo*, *joko*), leopard (*ngwi*), house (*-yumba* and *-dago*), moon (*-ezi*), sun (*-juba*), water (*-ndiba*, *mandiba*), lake or river (*anza*),³ drum (*ngoma*), name (*-ina* or *jina*), wizard (*-nganga*); adjectives like *-bi* (bad), *-eru* (white); verbs like *jwa* (to die), *ta* (to strike, kill), *la* or *lia* (to eat). The root-words cited are not a hundredth part of the total number of root-words which are practically common to all the spoken dialects of Bantu Africa. Therefore the possession amongst its root-words of a common name for “fowl” seems to the present writer to show conclusively that (1) the original Bantu tribe must have possessed the domestic fowl before their dispersal to the southern half of Africa began, and that (2) as it is historically certain that the fowl as a domestic bird did not reach Egypt before the Persian conquest in 525 B.C., and probably would not have been transmitted to the heart of Africa for another couple of hundred years, the Bantu exodus may safely be placed at a date not much anterior to 2100 years ago. It is also interesting to note that the designs on the Zimbabwe and other neighbouring monuments supposed to be made by the Semitic gold workers of Southern Zambezia exhibit natives with distinct Hottentot physical peculiarities, as though at the period when these buildings were erected (about 2000 years ago) black Bantu negroes were not familiar to the pre-Islamite Arabians who mined for gold in what is now Rhodesia. Early Arab geographers, also, while alluding to the Zenzibar or modern Zanzibar negroes on the east coast of Africa opposite Zanzibar, described the regions farther south as being inhabited by Wakwak, who from the accounts given seem to have been a savage people of Hottentot or Bushman race. Indeed, the very name Wakwak may be only a corruption and duplication of the Hottentot root *kwa*, which means “men” and is a constant tribal suffix.⁴ Further, the legends and traditions of the Bantu peoples themselves invariably point to a northern origin, and a period, not wholly removed from their racial remembrance, when they were strangers in the land. It is not to be supposed that this argument about the relatively recent occurrence of the Negro exodus which has spread the Bantu languages over a third of the Dark Continent implies that Africa south of the Equator was uninhabited, or even very sparsely inhabited, prior to the Bantu invasion. On the contrary, it would seem as if the southern half of Africa had been inhabited from a very early period in the history of mankind. It is merely that the invasion of the Bantu and the expansion of their family of languages are events of very recent occurrence. No doubt before their coming the eastern coast regions, down to about the Ruvuma river, were inhabited by a Nilotic type of Negro akin to the Shiluk, Dinka, and Masai; and the west coast of Africa, down to about the Congo mouth, was inhabited by negroes of the Guinea type, while the Congo forests and Angola were sparsely peopled by dwarf races, which in the south and south-east developed or degenerated into Bushmen and Hottentots. Seemingly the Bantu somewhat early in their migration down the east coast took to the sea, and not merely occupied the islands of Pemba and Zanzibar, but travelled as far afield as the Comoro archipelago, and even the west coast of Madagascar. Their invasion of Madagascar must have been fairly considerable in numbers, and they seemingly gave rise to the race of black people known traditionally to the Hovas as the Va-zimba.

The accompanying map will show pretty accurately the distribution of the Bantu-speaking Negroes at the present day. It will be seen by a glance at this map that the areas in which Bantu languages of archaic form and general purity from other elements are

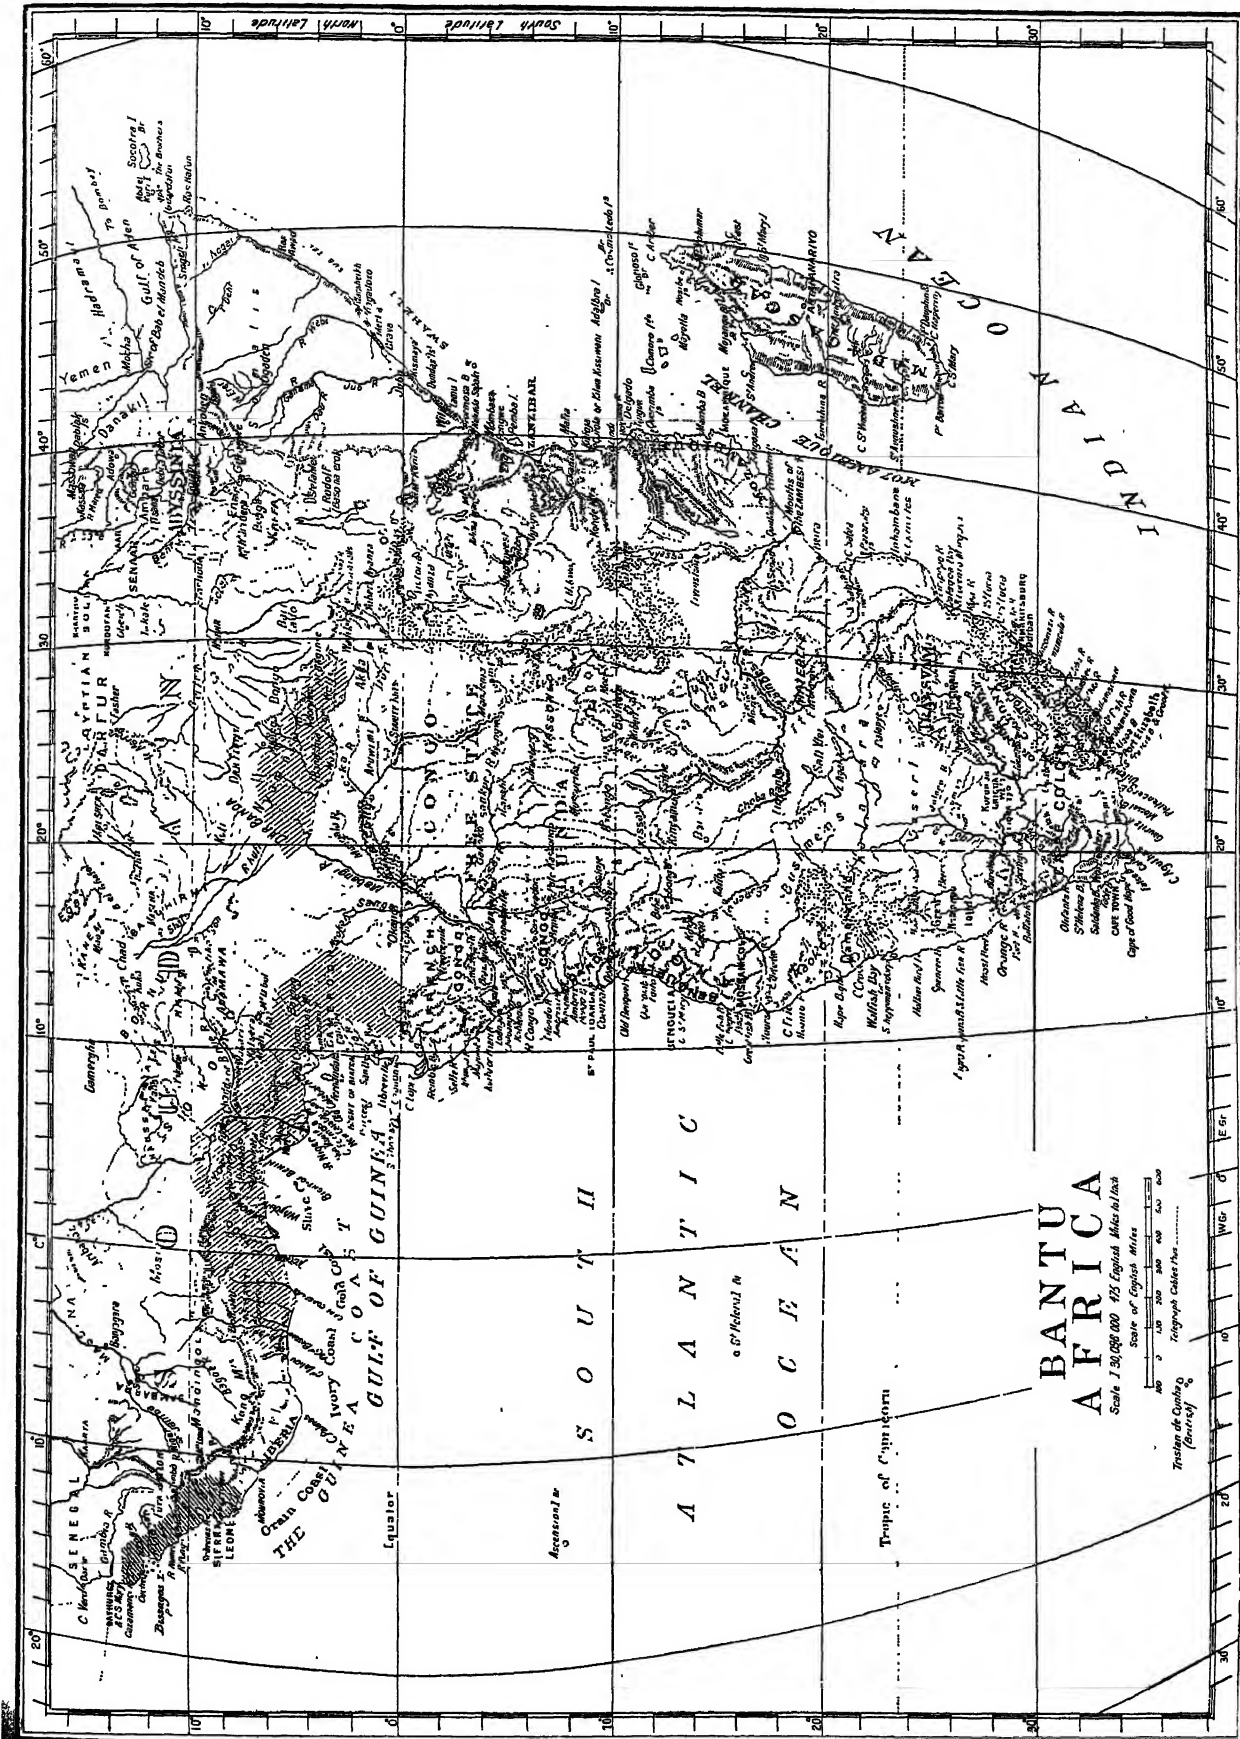

¹ In Luganda, the language of Buganda, Victoria Nyanza, and also in Lunyoro on the White Nile, the word for “fowl” is *nkoko*. In Ki-Swahili of Zanzibar it is *kuku*. In Zulu it is *inkuku*. In some of the Cameroon languages it is *lokoko*, and on the Congo it is *nkogo*, *nsusu*. On the Zambezi it is *nkuku*; so also throughout the tribes of Lakes Nyasa and Tanganyika.

² From this statement are excepted those tongues classified as “semi-Bantu.” In some languages of the Lower Niger and of the Gold Coast the word for “fowl” is generally traceable to a root *kuba*. This form *kuba* also enters the Cameroon region, where it exists alongside of *-koko*. *Kuba* may have arisen independently, or have been derived from the Bantu *kuku*.

³ Whence the many *nyanza*, *nyanja*, *nyasa*, *mwanza*, of African geography.

⁴ As in *Nama-kwa*, *Gri-kwa*, &c.

spoken are somewhat widely spread. Perhaps on the whole the most archaic dialects at the present day are those of Uganda, of

The Bantu language field. The gradation of the three tones indicates degrees of resemblance to original Bantu, other tongue, the darkest area showing the most archaic languages.

Languages slightly akin in structure and in vocabulary to Bantu.

Prefix-governed Languages akin in structure to Bantu but not in vocabulary.

MAP ILLUSTRATING THE PRESENT DISTRIBUTION OF THE BANTU-SPEAKING NEGROES.

the north-west coast of Tanganyika, and of the Awemba, who inhabit the country between the south-westernmost corner of

Tanganyika, the river Chambezi, and the districts round the north end of Lake Nyasa. Another language of typical Bantu construction is the Ki-yanzi or Ki-bangi tongue, spoken on a section of the Central Congo and on the Lower Ubangi river; another is the well-known Oci-herero of Damaraland. Ki-makonde, on the east coast of Africa, is archaic; so in some features is the celebrated Kiswa-hili of Zanzibar, and the Ci-bodzo of the Zambezi delta; while the celebrated Zulu-Kafir dialects, though they exhibit several marked changes in vocabulary and phonetics (both probably of recent date), preserve nevertheless so many of the characteristics of the hypothetical mother tongue that, until the languages of the great lakes came to be known, Zulu-Kafir was regarded as the Sanskrit of the Bantu. Perhaps it is so, as Sanskrit is now viewed in relation to the original Aryan tongue. In that case the lake dialects would correspond to Lithuanian (only "more so," that is to say, even nearer to the original Bantu than are the Lithuanian dialects to the hypothetical Aryan parent speech), the Oci-herero to Greek, and Ki-yanzi to Gothic.

With our present inadequate knowledge of the affinities of the existing Bantu tongues it is difficult and premature to divide them accurately into groups and subdivisions, the enumeration of which also in an article like the present becomes too much of a wearisome string of names; but there may be mentioned severally (1) the *Uganda* group of languages, occupying the area between Albert Nyanza and the White Nile, the north and west coasts of Victoria Nyanza, the north and north-west coasts of Tanganyika and the Congo forests (a clearly-marked congeries of kindred dialects); (2) the *Ki-amba* or *Ci-wemba*, between Tanganyika, Bangweulu, and Nyasa; (3) the *Nyamwezi* group, south of Victoria Nyanza; (4) the *Swahili*; (5) the *Nyika*, and (6) the *Kikamba* groups, on the east and north-east; (7) the *Ci-hche* group, south of the *Nyamwezi* and north of the Ruvuma river; (8) the well-marked *Makonde-Yao*, to the south of the Ruvuma, and south and east of the Yao; (9) the remarkable *Makua* tongue (which though very archaic in the roots of its vocabulary is, like the *Secuana*, singularly corrupt in phonetics). Southern and Eastern Nyasaland and Central Zambezia are filled (10) with various *Ci-nyanja* or *Mañanja* dialects. Immediately south of the Central and Lower Zambezi (putting aside the intrusive Zulu) is (11) the *Makaraka* group. South and west of that again is (12) the *Secuana*,¹ spoken over a wide area in closely-allied dialects. (The *Secuana*, like the *Makua*, though truly Bantu in its roots, is extremely corrupt in its phonetics.) It has not, however, except in one or two dialects, borrowed any "clicks" from the Hottentots.

To the south and east of the *Secuana* group lies (13) the important *Zulu-Kafir* section, which with cognate dialects stretches along the coast regions from Port Elizabeth in the south to Inhambane² in the north. The dialects in the coast region between Inhambane and the Zambezi share their alliance between the Zulu, Makaraka, and Nyanja groups. The word "Kafir" has been so long misapplied to the most southerly of the Bantu peoples that it is difficult to ignore it. It is simply the cant term of "infidel" applied by the Arabs of Sofala to the heathen Bantu round them, and communicated by the Arabs to the earliest Portuguese navigators who visited these shores. The Portuguese applied the term Cafres to all the east coast negroes from Natal to Quillimane. North-west of the *Secuana* is (14) the *Oci-herero* group of Damaraland, Ovamboland, and Portuguese West Africa as far north as Benguela and the highlands of Bihe. Herero is by far the most archaic of this section of the Bantu languages, the dialects related to it in the north and north-east being much more corrupt. The Central Zambezi region, west of the great Nyanja congeries of dialects, is mainly occupied by (15) the *Tonga* or *Toka* family, and west of this again is (16) the *Kiloi* language-group of Barotseland, which is related to (17) the *Kiboko* section of the Upper Zambezi and Lower Kasai. Then to the west comes (18) the great *Bunda* group, including most of the dialects of Angola and of the Lower Kwango. These shade by insensible gradations into (19) the *Kongo* family, on the Lower Congo from Stanley Pool to the sea, and extending north along the coast to Loango. The southern basin of the Congo is mainly occupied by one great family (20), the *Rua* or *Lunda* dialects, which stretch eastwards to the vicinity of Tanganyika, and even seem to include the *Ki-lungu* and *Ki-mambwe* of the Nyasa-Tanganyika Plateau. It is not known yet whether the language of the *Tu-shilange* and *Batetela* is related to the *Rua*. On the Upper Congo, from the vicinity of West Tanganyika and Nyangwe, down past Stanley Pool to the confluence of the Aruwimi, there seems to be one dominating form of the Bantu language which may be classified as (21) the *Manyema* group, and which exhibits very great corruption. The *Balolo* group (22) to the west, which occupies the regions immediately south of the

¹ In accordance with the phonetic system adapted from Lepsius, in which Bantu languages are transcribed, c stands for the English *ch*. *Secuana* is the language spoken by the Bechnana.

² This is the Portuguese town and district, which should really be pronounced Inyambane—Portuguese *nh*=*ny*.

Upper Congo, is seemingly related to the *Manyema*, but is less corrupted. The Lower Kasai would appear to be occupied by (23) a group which may be called, from one of its dialects, the *Kibuma*. These languages march with the Kongo dialects to the west. The greater part of the Central Congo, on both banks, and the Lower Ubangi are occupied by peoples speaking (24) the *Ki-bangi* (or *Ki-yanzi*) language. West of that, and about Stanley Pool and the interior of French Congo, is (25) the *Kiteke* group, which, with its allied languages, marches on the west with the Kongo dialects, and on the north-west with (26) the *Gabun* or *Mpongwe* family. North of the *Mpongwe* group (which ends about the Gabun river) is (27) the *Cameroon* group, which includes all the coast dialects up to the Rio del Rey (where the Bantu territory ends), and also the dialects of the island of Fernando Po. In the interior of Cameroon and of the Gabun there is a wide tract of country inhabited by tribes such as the Fan, which are evidently recent intruders, and can only be regarded as semi-Bantu. The general structure of these languages (*Mbudikumu*, *Mfut*, *Bayoh*, *Bamom*, *Panhwe* (Fan), *Papiax*, *Param*, *Penin*, *Balu*, *Nki*, *Meloh*, *Momenya*, *Bagba*, *Juka*, *Kamuku*, *Basa*, *Juku*, even the *Mici* south of the Benue) is essentially Bantu, but of a very corrupt kind. But although the shattered prefixes are of obviously Bantu origin, only a very small part of the vocabulary can be called Bantu, and in many important root-words the Bantu connexion is not at all obvious. These languages seem to be of a degraded type, and possibly are very remotely descended from cognate dialects of the original mother language. Eastward of this intrusive wedge of semi-Bantu we again come to Bantu languages to the north of the Congo, within the limits of the Congo basin, the *Sanga* group (28) of dialects spoken by the Bonjo, the Baya, the Ndere, and the Yangere, in the basin of the river Sanga and its affluents. Immediately east of this *Sanga* group, although the people would appear to be Bantu, we know too little about their dialects to be able to classify them in groups. Farther east still, in the region between the Welle and Albert Nyanza, we come to (29) the *Bavira*, the *Wazamboni*, and other tribes encountered by Stanley in his march to the relief of Emin Pasha. These inhabitants of the north-easternmost corner of the Congo forests and the adjoining grass country up to the southern half of the western shore of Albert Nyanza bring us back to the Uganda group of languages from which we started, and to this group the dialects last referred to would seem to be related.

This summary of the geographical grouping of the Bantu languages may be concluded by again directing attention to the striking contrast which exists, from a linguistic point of view, north and south of the Bantu border line—a border line which, commencing on the west coast of Africa close to the Niger delta, and following more or less closely the limits of the Northern Congo watershed to Albert Nyanza, the White Nile, and Victoria Nyanza, thence continues in an irregular line to the vicinity of Zanzibar. North of this line there is great linguistic confusion, and an almost uncounted number of separate linguistic families exists, each differing from the other as they differ in turn from Bantu. This is the condition of affairs throughout all Negro Africa between Abyssinia and the Atlantic. Once the Bantu border line is crossed, however, there is but one family of languages—the Bantu—prevailing, with the possible exception of relics of a Pygmy language in the Congo forests, of Hottentot or Nilotic fragments in the Zanzibar *Hinterland*, and, of course, the Hottentot and Bushman dialects in South-West Africa. The general homogeneity of the Bantu languages is greater than that of the existing condition of Aryan tongues, though it is a great exaggeration to say that the various Bantu dialects differ from one another no more than do the existing Romance languages.

The following propositions may be laid down to define the peculiar features of the Bantu languages:—

1. *They are agglutinative in their construction, their syntax being formed by adding prefixes and suffixes to the root, but no infixes* (that is to say, no syllable incorporated into the root-word).

2. *The root (excepting its terminal vowel) is unchanging to all intents and purposes, though its first or penultimate vowel or consonant may be modified in pronunciation by the preceding prefix or succeeding suffix. With one exception there is no inflexion; that exception (scarcely in origin a true one) is in the preterite tense of the verb in certain languages where the root changes in its termination, probably by the absorption of a suffix.*

3. *No two consonants come together without an intervening vowel (except where one of them is a nasal, a labial, or a semi-vowel); no consonant is doubled (except by the accidental juxtaposition of two m's or n's, one of which represents an abbreviated particle); no word ever ends in a consonant, except in rare instances where the termination through contraction and the dropping of a vowel becomes a nasal sound.*

4. *Substantives are divided into many classes or genders indicated by the pronominal particle prefixed to the root. Some of these prefixes are used in a plural sense, others in the singular. No singular prefix can be used as a plural, nor can a plural prefix be employed in the singular number. There is a certain degree of correspondence*

between the singular and plural prefixes (thus, No. 2 prefix (see below) invariably serves as plural to No. 1; No. 8 (plural) corresponds to No. 7 (singular), but this cannot be depended on as a rule). The full number of the prefixes is sixteen.¹ The pronominal particle or prefix of the noun is attached to the adjectives, pronouns, and verbs in the sentence which are connected with that noun, and though in course of time these particles may differ in form from the noun-prefix, they were formerly identical in origin. (This system is the "Concord" of Dr Bleek.) The pronominal particles, whether in nominative or accusative case, must always precede the verbal root, though they often follow the auxiliary prefixed particles used in conjugating the verbs. (An apparent but not a real exception to this rule is in the second person plural of the imperative mood, where an abbreviated form of the pronoun is affixed to the verb,² and other phases of the verb are occasionally emphasized by the repetition of the governing pronoun at the end.)

5. The verbal root may modify its termination by a change of the last vowel or by suffixing certain particles, or it may even change its radical vowel either to form a tense or to alter the original meaning of the simple stem.

6. The root of the verb is the second person singular of the imperative.

7. No sexual gender is recognized.

The sixteen original prefixes of the Bantu languages are given below. They are stated in the most archaic forms to be found in living languages; but their oldest types, and these latter obtained by deduction from the other forms of the particle used in the syntax, are given in brackets.

BANTU PREFIXES.

Singular.	Plural.
Class 1. Mu- (Ngu-)	Class 2. Ba-
" 3. Mu- (Ngu-)	" 4. Mi- (Ngi-)
" 5. Di- (Ndi-)	" 6. Ma- (Nga-)
" 7. Ki- (Nki-?)	" 8. Bi-
" 9. N or Ni	" 10. Ti-, Ti-n-, or <i>θi-</i> , ³ bi-n-, or Zi-, Zi-n-
" 11. Lu- (Ndu-)	" 12. Tu (often diminutive in sense)
" 13. Ka (usually a diminutive)	
" 14. Bu- (sometimes used in a plural sense; generally employed to indicate abstract nouns) ⁴	
" 15. Ku- (identical with the preposition "to," used as an infinitive with verbs, but also with certain nouns indicating functions of the body primarily)	
" 16. Pa- (locative: applied to nouns and other forms of speech to indicate place or position; identical with adverb "here," as <i>ku-</i> is with "there").	

To these sixteen prefixes should perhaps be added the preposition *mu-* "in," "into," which in some languages is used as a prefix or pronominal particle, as in the Swahili phrase { *M'nyumba-ni mu-ace* } = In his house—where the preposition *M'* (abbreviation for *Mu-*) has the particle *mu* (*mu*) agreeing with it and placed before the pronoun *-ace*.

Also the prefix in the singular number having a diminutive sense, which is found in some of the north-western⁵ Bantu tongues—*fi-* or *vi-*. This is possibly an additional prefix which has come into independent being in that rather divergent group. It cannot be traced to derivation from any of the other prefixes among the sixteen. It is always used in the singular, and its corresponding plural prefix is the twelfth (*tu-*).

The concord may be explained thus:—

Let us for a moment reconstruct the original Bantu mother tongue (as attempts are sometimes made to deduce the ancient Aryan from the most archaic of its daughters), and propound sentences to illustrate the repetition of pronominal particles known as the "concord."

OLD BANTU.

Abao ba-ntu ba-bi ba-ba-ota tu-ba-oga.
They they person they bad they they- who kill we them fear.
Rendered into modern dialect of Luganda, of Buganda:
Bo ba-ntu babi babota tu-ba-tia.
They they person they bad they they- who kill we them fear.
Or, again,

OLD BANTU.

Ngu-ti ngu-nguo ngu-gua; ku-ngu-mbona?
This tree this-one this falls; thou this seest?
("The tree falls; dost thou see it?")

Rendered into Kiguha of Tanganyika, this would be:

Muti guno gugwa; ugumona?
It tree this (one) it falls; thou it seest?

The prefixes and their once identical particles have varied greatly in form from the aboriginal syllables as the various Bantu dialects became more and more corrupt. The eighth prefix, *bi-*, becomes *vi-*, *pi-*, *fi-*, *fy-*, *si*⁶; *i-*, *by-*, *bi-*, *py-*, *ps-*, *zi-*. Further confusion is caused by the retention and fusion in the prefix of the preceding vowel which marked the full definite form when the prefix was used as a definite article or demonstrative pronoun. The definite forms of the prefixes were these: 1. *Umu* (*uigu*, *uñu*); 2. *Aba*; 3. *Umu* (*uigu*, *uñu*); 4. *Imi* (*ingi*, *ini*); 5. *Ili* (*indi*); 6. *Ama* (*anga*, *ana*); 7. *Iki*; 8. *Ibi*; 9. *In-*; 10. *Iñin* or *izin*; 11. *Ubu*; 12. *Uñu*; 13. *Aka*; 14. *Ubu*; 15. *Uku*; 16. *Apa*.

Not many of the existing Bantu languages possess all the prefixes of the mother tongue; that is to say, all the sixteen. Amongst those that do may be cited the Kirega, some of the Kavirondo dialects, and the Kiguha of the Uganda group; the Kiwemba of South Tanganyika; the Makonde of the Zanzibar coast, possibly the Nkonde dialects of the north end of Lake Nyasa; Oci-herero of Damaraland, and the Kongo language of the Lower Congo. The second prefix, *Ba*, retains its original form in the Uganda group, in the languages of North Tanganyika, on the Central Congo, in South-West Congoland, in Cameroon, Fernando Po, and the Gabun (with the exception of the Mpongwe); also in the upper part of the Central Zambezi, and perhaps in one or more dialects of West Nyasa and Kiwemba; in the Secuana dialects and in the Zulu-Kafir tongues. In the Herero group of languages it becomes *Va*, as also in parts of the Lower Zambezi and in South-East Africa. In the greater part of Eastern Africa and Nyasaland it becomes *Wa*, and dwindles finally into *A* in the Makua countries, in Southern Nyasaland, on the Nyasa-Tanganyika Plateau, among the Rua dialects of the South Congo basin, among the Manyema in Angola, on the Lower Congo, among the Mpougwe, and in some of the dialects of the Nyika and the Kamba groups in the north-eastern part of the Bantu language-field. North of the 10th parallel of south latitude the tenth prefix (*θi* or *Zi*) is rarely met with, though traces of its former existence may be deduced from its presence in the concordant particles. Thus, though it is absent as a plural prefix for nouns in the Swahili of Zanzibar, it reappears in the Concord. For instance: *ñombe hizi zangu*—cows these mine (These cows are mine). Although *ñombe* has ceased to be *ziñombe*, in the plural the *zi* particle reappears in *hizi* and *zangu*. Nevertheless, the tenth prefix is still met with in its full form in Kongo, perhaps in Mpougwe, and in the Kavirondo dialects of the Uganda group.

The pronouns in the Bantu are in most cases traceable to some such general forms as these:—

I, me	<i>ñgi</i> , <i>mi</i> . ⁷
Thou, thee	<i>ku</i> .
He or she, him, her	<i>a</i> ; also <i>ngu</i> , <i>mu</i> (which becomes <i>yu</i> , <i>ye</i>); there is also another form perhaps, <i>ndi</i> , but the pronouns for the third person, as in so many other languages, partake largely of the nature of demonstrative pronouns, and are often identical with the latter.
Ye, you	<i>nu</i> , <i>mu</i> .
They, them	<i>ba</i> , <i>ba</i> .

In addition to this it must be remembered that the Bantu languages do not distinguish sex, but divide all objects in the third person into two main divisions—(1) human beings and such other living creatures as may be distinguished by the first and second prefixes; (2) all other substances not actively "alive," which are distributed amongst the other "classes" of nouns. The pronominal particles of these are determined by the class to which they belong, the particles in question being more or less identical with the prefixes.

The Bantu verb consists of a practically unchangeable root which is employed as the second person singular of the imperative. To this root are prefixed and suffixed various particles. These are worn-down verbs which have become auxiliaries, or reduced adverbs or prepositions.⁸ It is probable (with one exception) that the building up of the verbal root into moods and tenses has taken place independently in the principal groups of Bantu languages, the arrangement followed being probably founded on a fundamental system common to the original Bantu tongue. The exception alluded to may be a method of forming the preterite tense, which seems to be shared by a great number of widely-spread Bantu languages. This may be illustrated by the Zulu *tanda*, love, which changes to *tandile*, have loved, did love. This *-ile* or *-ilē*

¹ Possibly seventeen.

² *Ita*=call! *Ita-ni*=call ye! *ni*=ye.

³ English *th-* in "think."

⁴ As *mu-ntu*, a man; *du-ntu*, humanity.

⁵ Perhaps in the Eastern Congo basin. In the form of *I-* it is seemingly present in Manyema.

⁶ *Shi-*, the *F* palatized.

⁷ *Mi* is probably a softening of *ñgi*. *ñi*; *ñgi* becomes in some dialects *vñi*, *ndi*, *ni*; there is in some of the coast Cameroon languages a word *mā* for "I," "me," the origin of which is not very clear.

⁸ Once, in their turn, nouns.

may become in other forms *-idi*, *-ire*, *-ini*, but is always referable back to some form like *-ili* or *-ile*, which is probably connected with the root *li* or *di* (*nādi* or *nā*), which means "to be" or "exist." The initial *i* in the particle *-ile* often affects the last or penultimate syllable of the verbal root, thereby causing one of the very rare changes which take place in this vocable. In many Bantu dialects the root *pa* (which means to give) becomes *pele* in the preterite (no doubt from an original *pa-ile*). Likewise the Zulu *tandile* is a contraction of *tanda-ile*.

Two other frequent changes of the terminal vowel of the common root are those from the vowel *a* (which is almost invariably the terminal vowel of Bantu verbs), (1) into *e* to form the subjunctive tense, (2) into *i* to give a negative sense in certain tenses. It has been stated that the vowel *a* almost invariably terminates verbal roots. The exceptions to this rule are so rare that it might almost be included among the elementary propositions determining the Bantu languages. And these exceptions when they occur are generally due (as in Swahili) to borrowed foreign words (Arabic, Portuguese, or English).¹ This point of the terminal *a* is the more interesting, because by changing the terminal vowel of the verbal root and possibly adding a personal prefix one can make nouns from verbs. Thus in Luganda *senyua* is the verbal root for "to pardon." "A pardon" or "forgiveness" is *ki-senyuo*. "A pardoner" might be *mu-senyui*. In Swahili *patanisha* would be the verbal root for "conciliate"; *mpatanishi* is a "conciliator," and *upatanisho* is "conciliation." Another marked feature of Bantu verbs is their power of modifying the sense of the original verbal root by suffixes, the affixion of which modifies the terminal vowel, and sometimes the preceding consonant of the root. The fullest number of these variations and their usual meanings are as follows:—

Supposing an original Bantu root, *tanda*, to love; this may become

<i>tandwa</i>	.	.	.	to be loved.
<i>tandeka</i> or <i>tandika</i>	.	.	.	to be lovable.
<i>tandila</i> or <i>tandela</i> ²	.	.	.	to love for, with, or by some other person.
<i>tandiza</i> (or <i>-eza</i>)	}	.	.	to cause to love.
<i>tandisa</i> (or <i>-esa</i>) ³				
<i>tandana</i>	.	.	.	to love reciprocally.

The suffix *-aka* or *-aga* sometimes appears and gives a sense of continuance to the verbal root. Thus *tanda* may become *tandaka* in the sense of "to continue loving."⁴

The negative verbal particle in the Bantu languages may be traced back to an original *ka* or *sa* in the Bantu mother tongue. Apparently in the parent language this particle had already two forms—*ka* and *sa*. In the vast majority of the languages at the present day the negative particle in the verb (which nearly always coalesces with the pronominal particle) is descended from this *ka* or *sa*, assuming the forms of *ka*, *ga*, *nga*, *sa*, *ta*, *ha*, *u*. It has coalesced to such an extent in some cases with the pronominal particle that the two are no longer soluble, and it is only by the existence of some intermediate forms (as in the Kongo language) that we are able to guess at the original separation between the two. Originally the negative particle *ka* or *sa* was joined to the pronominal particles, thus:—

<i>Ka-ngi</i>	.	.	.	not I.
(therefore <i>Ka-ngi tanda</i> = I not love.)				
<i>Ka-ku</i> or <i>ka-wu</i>	.	.	.	not thou.
<i>Ka-a</i>	.	.	.	not he, she.
<i>Ka-tu</i>	.	.	.	not we.
<i>Ka-nu</i>	.	.	.	not ye.
<i>Ka-ba</i>	.	.	.	not they.

In like manner *sa* would become *sa-ngi*, *sa-wu*, &c. But very early in the history of Bantu languages *ka-ngi*, or *sa-ngi*, became contracted into *kai*, *sai*, and *ki*, *si*; *ka-ku* or *ka-wu* into *ku*; and *kaa* or *saa* have always been *ka* or *sa*. Sometimes in the modern

¹ Exceptions to this rule are of course foreign interjections which in course of time have been verbalized, and the verbal particle *li* or *di*, which means "to be."

² Or *-ira*, *-era*.

³ This form may also appear as *sa*, as for instance *aka* = to be on fire, becomes *asa*, to set on fire.

⁴ In choosing this common root *tanda*, and applying it to the above various terminations, the writer is not prepared to say that it is associated with all of them in any one Bantu language. One has to be so very careful what one writes on the subject of the Bantu languages in general, because at the present time very few people are living who have studied several of these languages. There are students of Zulu and Chinyanja, of Kongo, of Swahili, of Luganda, who are apt to attack a theory which does not exactly accord with the state of things of which they have made an exclusive study. Thus, although *tanda* is a common verb in Zulu, it has not in Zulu all these variations, and in some other language where it may by chance exhibit all the variations its own form is changed to *londa* or *randa*.

languages the negative particle is used without any vestige of a pronoun being attached to it, and is applied indifferently to all the persons. Sometimes this particle has fallen out of use, and the negative is expressed (1) by stress or accent; (2) by a suffix answering to the French "pas," and having the same sense; and (3) by the separate employment of an adverb, like the "not" in English.

AUTHORITIES.—*A Comparative Grammar of South African Languages* (in two parts, left unfinished) by Dr W. H. I. BLEEK, 1869.—*Cenni di Glottologia Bantu Sud-Africana*, by Dr GIACOMO DI GREGORIO. (Turin, 1882.) This last not much more than a paraphrase of the work of Bleek and others.—*A Sketch of the Modern Languages of Africa*, by R. N. CUST, 1882.—*Comparative Grammar of the South African Bantu Languages*, by Father J. TORREND. (Mainly based on a study of the languages of the Central Zambezi, and therefore erroneous in some deductions, and incomplete.)—*The Kilimanjaro Expedition*, by H. H. JOHNSTON, 1884. (Slight sketch of the history and structure of the Bantu languages given at the end of the book.)—*British Central Africa*, by Sir H. H. JOHNSTON (1898, second edition); a further description of the Bantu languages in general is given in this book, together with vocabularies and illustrations of the Bantu languages of South Central Africa.—*Man: Past and Present*, by Professor A. H. KEANE, 1899.—*An Encyclopædic Dictionary of the Mañanja (Mang'anja) Language of British Central Africa*, by the Rev. D. C. SCOTT, 1891.—*The Folklore of Angola*, by Dr ELI CHATELAIN.—*A Dictionary of the Kongo Language*, by the Rev. HOLMAN BENTLEY.—*Polyglotta Africana Orientalis*, by J. T. LAST.—The late BISHOP STEERE'S *Manuals of the Swahili, Shambala, and Makonde Languages*—*Introductory Handbook of the Yao Language*, by the Rev. ALEXANDER HETHERWICK.—*Vocabularies of Various Kongo Languages*, compiled by Dr A. SIMS; (published by Gilbert and Remington).

The present writer has, however, relied considerably for his information on vocabularies and other studies of Bantu languages independently compiled by himself, which are not yet accessible in print, but which he hopes to publish shortly. Some of these vocabularies (especially those to the north-west of the Bantu border line) have been printed in Foreign Office reports dealing with the Niger. Vocabularies of more or less value may also be found in Sir H. M. STANLEY'S *Through the Dark Continent*, and in *Darkest Africa*; also, in SERPA PINTO'S *How I Crossed Africa*, and in Commander V. L. CAMERON'S *Across Africa*. An interesting study of a little-known language is the *Método Prático para Fallar a Lingua da Lunda*, by HENRIQUE DE CARVALHO. This work, the outcome of a Portuguese expedition to the Lunda country, was published in 1889 at Lisbon by the Imprensa Nacional. Another work which should certainly be consulted, especially in regard to the Western Bantu borderland, is KOELLE'S *Polyglotta Africana*. (H. H. J.)

Banville, Théodore Faullain de (1823-1891), French poet and miscellaneous writer, born at Moulins in the Bourbonnais on 14th March 1823, was the son of a captain in the French navy. His boyhood, by his own account, was cheerlessly passed at a lycée in Paris; he was not harshly treated, but took no part in the amusements of his companions. On leaving school with but slender means of support, he devoted himself to letters, and in 1842 published his first volume of verse (*Les Cariatides*), which was followed by *Les Stalactites* in 1846. The poems encountered some adverse criticism, but secured for their author the approbation and friendship of Alfred de Vigny and Jules Janin. Henceforward Banville's life was steadily devoted to literary production and criticism. He printed other volumes of verse, among which the *Odes Funambulesques* received unstinted praise from Victor Hugo, to whom they were dedicated. Later, several of his comedies in verse were produced at the Théâtre Français and on other stages; and from 1853 onwards a stream of prose flowed from his industrious pen, including studies of Parisian manners, sketches of well-known persons (*Camées Parisiennes*, &c.), and a series of tales (*Contes bourgeois*, *Contes héroïques*, &c.), most of which were republished in his collected works (1875-78). He also wrote freely for reviews, and acted as dramatic critic for more than one newspaper. Throughout a life spent mainly in Paris, Banville's genial character and cultivated mind won him the friendship of the chief men of letters of his time. He was also intimate with Frédéric

Lemaître and other famous actors. In 1858 he was decorated with the Legion of Honour, and was promoted to be an officer of the order in 1886. He died in Paris on 15th March 1891, having just completed his sixty-eighth year. Banville's claims to remembrance rest mainly on his poetry. His plays are written with distinction and refinement, but are deficient in dramatic power; his stories, though marked by fertility of invention, are as a rule conventional and unreal. Most of his prose, indeed, in substance if not in manner, is that of a journalist. His lyrics, however, rank high. A careful and loving student of the finest models, he did even more than his greater and somewhat older comrades, Hugo, de Musset, and Gautier, to free French poetry from the fetters of metre and mannerism in which it had limped from the days of Malherbe. In the *Odes Funambulesques* and elsewhere he revived with perfect grace and understanding many old poetic forms, such as the *rondeau*, the *vilanelle*, and the *pantoum*. He was a master of delicate satire, and used with much effect the difficult humour of sheer bathos, happily adapted by him from some of the early folk-songs. He has somewhat rashly been compared to Heine, whom he profoundly admired; but if he lacked the supreme touch of genius, he remains a delightful writer, who exercised a wise and sound influence upon the art of his generation. (c.)

Baptists.—(1) *United Kingdom.*—The condition of the Baptists in the United Kingdom during recent years appears to have been one of steady prosperity, their members and adherents having increased at a rate probably more than proportionate to the increase of the population at large. In the *Baptist Year-Book* for 1901, the following statistics were given for their churches in 1900, excluding chapels which are "non-associated" and have no relations with the Baptist Union: churches 2739 (2812), places of worship 3918 (3798), members 365,678 (304,163), Sunday scholars 528,131 (448,921), local preachers 5562 (4155), pastors 1992 (1841). The figures in brackets are those for 1891; and in comparing them it should be borne in mind that whereas in 1891 estimated statistics were included for those churches which failed to send in returns, these are omitted in 1900, and "the figures given represent the statistics actually received in the returns from the churches"; and "the editor, as in former years, does not vouch for more than approximate correctness in the statistics." The Baptist Missionary Society, the earliest to be founded in the United Kingdom (i.e., outside the Church of England), had a home income of £77,642, 2s. 9d. for the year ending 31st March 1900; and the expenditure during the same period was £81,912, 4s. 11d.: the list of missionaries on active service contains 146 names. Perhaps the most important event of recent years was the inauguration of a "Twentieth Century Fund" on the same general lines as those of the Wesleyans and Congregationalists. The proposal was to raise at least £250,000 before 21st April 1902, one half to be allotted to a "forward movement," and the rest to assisting weaker churches in the maintenance of their pastors, providing an annuity fund, building a Baptist church house, &c. Of this sum about £180,000 had been promised by August 1901; and the president of the Baptist Union declared, in the Autumn assembly of the previous year, that the movement had "risen far above money" and been productive of much spiritual good.

The *Baptist Year-Book*, published annually, gives full particulars of Baptist societies, colleges, publications, &c. (w. E. Co.)

(2) *United States.*—During the period 1875-1900 the Baptists of the United States increased more rapidly than the population as a whole, until in 1900 they

reported 29,473 churches with 4,181,686 members. If to these we add numerous smaller bodies, such as the Free-Will Baptists and the Primitive Baptists, the total Baptist Church membership in the United States is about 4,500,000. But the chief growth in recent years has been in the direction of internal organization and education. Without any central ecclesiastical authority, or any one form of worship, or any one binding creed, the Baptists have developed a number of large and powerful voluntary organizations, which in turn have reacted strongly on the denominational life. Some of these were formed early in the 19th century, but many of them are of recent growth. The most important are the American Baptist Foreign Missionary Union (formed in 1814), the American Baptist Publication Society (1824), the American Baptist Home Mission Society (1832), the Southern Baptist Convention (1845), the American Baptist Historical Society (1853), the Baptist Congress (1882), the American Baptist Education Society (1888), and the Baptist Young People's Union of America (1891). Since 1870 five different Women's Societies have been formed for prosecuting missionary work at home and abroad. The Educational Society has had a notable career. Through its agency the University of Chicago was founded, and from the treasury of the Education Society sixty-six other institutions have been aided, the total assistance thus offered amounting to \$1,273,100. Almost all of this was given on condition that far larger sums should be raised by others, and the resulting increase in the endowment of educational institutions has been very great. A scarcely less important work has been done by refusing aid to institutions whose further existence was needless. The Baptist Congress is an organization meeting annually in various cities for the discussion of questions of current interest, furnishing a platform on which all varieties of denominational opinion may find a hearing. It has done much to promote mutual understanding and tolerance of divergent views. The Baptist Young People's Union now includes several thousand young people's societies, and by its "Christian Culture Courses" (in which 15,000 persons were enrolled and examined in 1899) has performed a valuable work. The result of these various movements has been increased concentration of effort and centralization of administrative power, a decline of interest in sectarian controversy, and increased hospitality to new truth on the part of the entire denomination. No longer content with the attitude of protest and separation, the churches have devoted themselves to the development of their resources, and the training of leaders for the future.

The most striking change has been seen in the new attitude of the denomination towards education. In their earlier history in the United States, the Baptists were inclined to depreciate formal intellectual discipline, as tending to interfere with the spontaneity and power of true religion. But within twenty years the interest in education has advanced with unprecedented rapidity, and the gifts to education have been very generous. Brown University, founded in 1764, is the mother of all the Baptist institutions of the country. Vassar College, founded in 1861 under Baptist auspices, was the pioneer in the collegiate instruction of women in America, and marked a new epoch in American education. The University of Chicago, founded in 1890, seemed to grow up out of the prairie as if by magic, and within ten years reported 3500 students, and a property in buildings and endowment amounting to \$13,000,000. This one institution has visibly changed the intellectual and religious development of the western states. Large sums have also been expended in academies and secondary schools, while the "freedmen's schools," planted by northern generosity

among the coloured people of the south, have done much to lift the level of the negro race in America. The *Baptist Year-Book* for 1900 reported as under Baptist control, seven theological seminaries with 1100 students; 104 colleges and universities with 26,000 students; and 84 academies with 11,000 students. The theological seminaries have buildings and endowment amounting to \$4,850,000; the colleges and universities have about \$30,000,000 in endowment and buildings; while the academies represent a valuation of \$5,000,000. The result of these great endowments for Christian education is already seen in wider sympathies, a wiser evangelism, more important contributions to research and to literature, and a much higher standard of admission into the ranks of the ministry. A change of emphasis on doctrine has been a feature of great importance in recent denominational history. While retaining the essential tenets of their fathers, the new generation have acquired a new view of the Bible, a fresh interest in humanitarian effort, a new zeal in missionary enterprise, and a deeper interest in the application of truth to the present life of the world. (W. H. P. F.)

Baraba, or **Barabinskaya Steppe**, vast prairies of South-Western Siberia, between the Ob and the Irtysh, 52° to 56° N. lat., 75° to 85° E. long., comprising the Kainsk district of Tomsk and those of Omsk and Tara of Tobolsk. They are divided naturally into three parts: the Baraba proper, the Kulunda Steppe, and the Berezovaya Steppe, to which the marshy lowlands of the Vas'yugan are sometimes improperly added. The resemblance of these prairies to those of Canada about Winnipeg is striking. But nowhere in the world are vast areas of so low an altitude, *i.e.*, from 200 to 300 feet above the sea, found at such a great distance (over 1000 miles) from the ocean. They offer quite flat lowlands covered with a fertile soil, similar to the black earth of South Russia, in which even shingle had to be brought from enormous distances for the building of the railway. The slope of the surface is so gentle that immense marshes are formed farther north on the Vas'yugan, and the rivers flow lazily over the prairies, forming lakes which are rapidly drying up, while others, which formerly were freshwater lakes, have now become salt. The drying up of the lakes of the Chany basin has been so rapid that villages occupy ground that eighty years ago was covered with lakes. The Baraba Steppe has now a considerable and wealthy Russian population, distributed in large villages.

See MIDDENDORFF'S *Die Baraba*.—YADRINTSEFF in *Zapiski of West Siber. Branch of Russ. Geogr. Soc.*, ii. (P. A. K.)

Bara Banki, a town and district of British India, in the Fyzabad division of Oudh. The town, which forms one municipality with Nawabganj, the administrative headquarters of the district, is 17 miles east of Lucknow by railway. The population is about 14,500; the municipal income in 1897-98 was Rs.18,940. There is some trade in sugar and cotton.

The district of BARA BANKI has an area of 1740 square miles. The population in 1891 was 1,130,906, being 649 persons per square mile. Classified according to religion, Hindus numbered 943,778; Mahommedans, 185,938; Christians, 147, of whom 21 were Europeans; "others," 1043. In 1901 the population was 1,179,532, showing an increase of 4 per cent. Land revenue and rates were returned as Rs.18,67,851, the incidence of assessment being R.1:10:2 per acre; the number of police was 4129. In 1896-97, out of a total cultivated area of 670,813 acres, 219,096 were irrigated from wells, tanks, &c. The principal crops are rice, wheat, pulse, and other food-grains, sugar-cane, and opium. Both the bordering rivers

are navigable; and the district is traversed by two lines of the Oudh and Rohilkhand railway, with eleven stations. Trade in agricultural produce is active.

Baraboo, capital of Sauk county, Wisconsin, U.S.A., situated in the southern part of the state, on Baraboo river, and on the Chicago and North-Western Railway, at an altitude of 861 feet. Population (1880), 3266; (1890), 4605; (1900), 5751.

Baracaldo, a town of Spain, province of Biscay, on the Nervion or Bilbao river. It has important iron-works and a dynamite factory, and is connected by rail with all the mining districts of Somorrostro and the coast to Santander. The low flat country is covered with maize, pod fruit, and chacoli vine. Few towns in Spain have sprung up so rapidly. By 1887 its population was 8870, and by 1897, 12,709.

Baracoa, a seaport city of the north coast of eastern Cuba, the chief centre of the banana export trade. It is the oldest town in Cuba, having been settled as the first capital by Lieut.-Governor Diego Velasquez in 1511. It is also the oldest city in the territory now under the American flag. Population, 4937.

Barbados, an island of the British West Indies, lying 100 miles to the east of St. Vincent; area 166 square miles, with a dense population, which rose from 182,000 in 1891 to about 192,000 in 1900, mostly coloured. From the results of recent marine surveys Barbados would appear to belong geologically, not to the West Indian system proper, but to the Venezuelan coast range (Sierra Cumana), of which it at one time formed a seaward extension, the north-easterly direction of which is still indicated by the intervening islands of Trinidad and Tobago. It is one of the most thickly peopled lands in the world, and of the whole surface (106,500 acres) about 100,000 acres are under cultivation. The temperature is equable, ranging from 60° F. to 80° F. in the cool season, which is also the dry season (extending from Christmas to the end of May); and from 73° to 86° in the hot season. The rainfall of 1898 was 65 inches; September being the wettest month, and May the driest. The death-rate in 1898 was 39 per 1000. The density of the population compels to constant labour. The Barbadian negroes are, as a rule, more intelligent than those of the other West Indian islands. The whole island is almost entirely given up to sugar growing and manufacture: in 1898 there were 441 sugar-works in operation, with antiquated methods of machinery. Barbados is the headquarters of the Imperial Agricultural Department for the West Indies, instituted in 1898, on the recommendation of the West India Royal Commission of 1897. The value of the imports of 1896 was £1,049,000; that of 1899 was £998,006. In 1896 the exports were valued at £758,000, and in 1899 at £845,590. Of the exports, £610,405 represented produce of the colony. Of the island produce, the value of £473,750 was due to sugar, and £109,252 to molasses. The exports are distributed as follows:—to the United Kingdom, £13,834; British Colonies, £131,580; foreign countries (chiefly United States), £464,991. The imports were derived as follows:—from the United Kingdom, £429,148; British Colonies, £135,417; foreign countries (mainly United States), £433,441. The revenue for 1899 was £216,022, the expenditure for the same year being £207,883. In 1899 the revenue was swelled by a grant from the Imperial Government of £40,000 to repair damage done by the hurricane of 1898; and the expenditure by £31,443 spent on this account. In 1899 the public debt was £414,000. The revenue is derived mainly from customs and excise. The only mineral product is

"manjak," or glance pitch, a form of asphalt, which occurs in the older rocks of the Scotland district, which yielded in 1899 £2297 at £4, 10s. per ton. The manufactures of Barbados are few and comparatively insignificant—rum distilleries, a sulphuric acid factory, chemical mixing factories, one cigar and tobacco factory, and one ice factory. There is a fortnightly mail service between Bridgetown, the capital of the island, and Southampton; and also a fortnightly service between Canada and the Windward Islands and British Guiana, calling at Barbados, and frequent communication with the other West Indian Islands. A total tonnage of 632,553 entered and 632,864 cleared during 1899; but this is exclusive of a large number of vessels merely touching at the port. There is no inland telegraph, but a telephone service supplies its place, and a railway (24 miles in extent) runs partly round the island. In 1899 the island had three colleges, six secondary schools, and 171 elementary schools. In the last-named there were 25,334 children on the rolls, with an average attendance of 14,978. Codrington College was in 1899 in danger of being closed for lack of funds due to the decline of the value of the estates forming its endowment, but a special subscription was raised in England and the island, and this misfortune was averted. The police force consists of 355 officers and men. There are (1900) stationed in the island the headquarters and four companies of a British regiment and two companies of the West Indian regiment—the functions of the commanding officer extending throughout the British West Indies (except Jamaica) and British Guiana. The colony possesses representative institutions, but not responsible government. The Crown has a veto on legislation, and the Home Government controls the appointment of public officers. The Government consists of the governor, an executive council, a legislative council of nine members appointed by the Crown, and a House of Assembly having twenty-four members elected annually on the basis of a moderate franchise. The governor was for many years governor-in-chief of the Windward Islands, but in 1885 Barbados was made a separate government. (A. H. K.)

Barberino, two towns of Italy (Tuscany, province of Florence): (1) B. di Mugello, 16 miles N. of Florence. Population, about 10,500. (2) B. di Val d'Elsa, 16 miles S. by W. of Florence. It produces many chip and straw hats. Population, about 10,500.

Barberton. See TRANSVAAL.

Barbizon School, The.—This designation is applied to an illustrious group of French artists more or less associated with the village of Barbizon, near the forest of Fontainebleau, whose lives cover, roughly speaking, the first three-quarters of the 19th century. Its leaders were Corot, Rousseau, Millet, and Daubigny; and with them were associated Diaz, Dupré, Jacque, Français, Harpignies, and others less known. They founded a school of painters of the country—of its landscape and its peasant life—whose influence is so widespread that it may be traced in the art of every western nation at the present day. Each of the leaders of this group possessed a strong and individual genius, yet with all the wide differences of temperament, there exists in their work, taken as a whole, a common impulse sufficiently evident to justify the rough classification as a "school." It is, however, impossible to draw a hard and fast line; other artists, such as Decamps, Troyon, and Courbet, worked on similar lines; but, broadly speaking, the distinction of the Barbizon group is that they were the greatest of those who put aside the conventional idea of subject in their works, and in going direct to the fields and the woods for their inspiration, struck

out a new path. In considering individual members of this group, it is enough to say here that the art of Corot was not allied to that of any contemporary painter, and, strictly speaking, owed nothing to Barbizon or its influences; nor perhaps did the art of Daubigny. The distinctive note of the school is seen in the work of Rousseau and of Millet, each of whom, after spending his early years in Paris, made his home in Barbizon. Unappreciated, poor, and neglected, it was not until after years of struggle that they attained recognition and success. They both died there: Rousseau in 1867, and Millet in 1875. It is difficult now to realize that their work, so unaffected and beautiful, should have been so hardly received. To understand this, it is necessary to remember the conflicts that existed between the classic and romantic schools in the first half of the 19th century, when the classicists, followers of the tradition of David, were the predominant accepted school. The romantic movement, with Géricault, Bonington, and Delacroix, was gaining favour. In 1824 Constable's pictures were shown in the Salon, and fixed the resolve of the younger men to abandon the lifeless pedantry of the schools and to seek inspiration, as he did, from nature. As may be imagined, every new departure was contested by the men in authority, who, quite honestly unable to see merit in works which ignored their cherished ideals, rejected them from the salons again and again. Rousseau was so often and persistently rejected that he was known as *le Grand Refusé*. In those troubled times Rousseau and Millet unburdened their souls to their friends, and their published lives contain many letters, some extracts from which will express the ideals which these artists held in common, and show clearly the true and firmly-based foundation on which their art stands. Rousseau wrote, "It is good composition when the objects represented are not there solely as they are, but when they contain under a natural appearance the sentiments which they have stirred in our souls. . . . For God's sake, and in recompense for the life He has given us, let us try in our works that the manifestation of life be our first thought: let us make a man breathe, a tree really vegetate." And Millet—"I try not to have things look as if chance had brought them together, but as if they had a necessary bond between themselves. I want the people I represent to look as if they really belonged to their station, and that imagination cannot conceive of their ever being anything else. People and things should always be there with an object. I want to put strongly and completely all that is necessary, for I think things weakly said might as well not be said at all, for they are, as it were, deflowered and spoiled—but I profess the greatest horror for uselessness (however brilliant) and filling up. These things can only weaken a picture by distracting the attention toward secondary things." In another letter he says—"Art began to decline from the moment that the artist did not lean directly and naïvely upon impressions made by nature. Cleverness naturally and rapidly took the place of nature, and decadence then began. . . . At bottom it always comes to this: a man must be moved himself in order to move others, and all that is done from theory, however clever, can never attain this end, for it is impossible that it should have the breath of life." It does not seem to-day that there is anything to contest in these words; nor is it easy now, on seeing how naturally the works of the Barbizon painters take their place in true line of succession with the masterpieces of the older schools, to imagine the storms that raged round them in their early days. Time has justified them; and those who led this little band now rank with the greatest of the many artists whom France proudly counts among her sons.

Hall, 1891. (Mr Thomson gives a full list of the French authorities to be consulted.)—JULES BRETON. *Nos Peintres du Siècle*. Paris, 1900. Also the articles on COROT, MILLET, ROUSSEAU, DAUBIGNY, DIAZ, TROYON, and SCHOOLS OF PAINTING. (G. CL.)

Barbuda. See ANTIGUA.

Barcellona, a town of the province of Messina, Sicily, Italy, 27 miles W. by S. from Messina by rail. It prepares lemon juice and olive oil, manufactures macaroni and pottery, burns lime, and makes bricks. It is formed by the union of two communes—Barcellona and Pozzo di Gotto. Population about 18,000.

Barcelona, a maritime province in the N.E. of Spain, with an area of 2985 square miles. It is flat near the sea, but rises inland. The highest peak is Coll de Fou, 8317 feet. For many years Barcelona has been the most populous province in the kingdom, having in 1877 835,306 inhabitants; in 1887, 899,264; and in 1897, 1,034,538, in fact a little over the eighteenth part of the whole population of Spain. Emigration, chiefly to South America, has in no year taken more than 2000 inhabitants. The province is divided into 13 administrative districts, 3 of which constitute the city of Barcelona, and 320 parishes. None of the rivers are navigable, and the roads are in general indifferent and insufficient. The province is better off in regard to railways, of which there are 349 miles. Besides the main and more important lines, like those which communicate with Saragosa (65 miles within the province), France, and Valencia, there are several useful and local lines connecting with important centres of industry. Indeed, to the Spaniards this province is, in a measure, a Manchester, Leeds, Sheffield, and Birmingham all in one. In every direction the country looks like a veritable hive of human activity and enterprise, every town and village full of "fabricas," with their tall chimneys, and alive with the din of machinery. Next to Barcelona rank as prosperous manufacturing centres, Badalona, with 18,075 inhabitants; Igualada, 10,419; Manresa, 25,121; Mataro, 19,918; Sabadell, 23,044; Tarrasa, 15,440; Vich, 11,724; Villanueva-y-Geltru, 12,046; and nine other towns, ranging from 5000 to 8000 inhabitants. There were, in 1898, 12,812 acres of irrigated soil and 91,857 acres of dry soil devoted to the culture of wheat, 51,562 acres to barley, oats, rye and maize, 22,812 to pod fruit, 13,500 to olive plantations, and 89,187 to the vine. The live stock included 11,389 horses, 9909 mules, 8293 asses, 10,499 cattle, 93,649 sheep, 20,173 goats, 18,886 pigs. The mineral productions are lead, zinc, lignite, salt, subterranean waters; 8 salt and 13 lignite mines are in full production, but 197 mines, though duly registered, are unproductive. The province is very rich in mineral waters, containing 12 sulphurous springs, 22 chloruretted, 5 of bicarbonate, and 18 ferruginous. In point of climate the province can be divided into three distinct zones: a temperate one near the sea, where even palm and orange trees grow, a colder one in the valleys and plains, more inland, and a colder still among the mountains, where not a few peaks are snowclad for a great part of the year. In point of education this province is quite among the first in Spain, and as far back as 1880 there were 97,077 children enrolled on the school registers; the figures have since steadily increased.

Barcelona, the capital of the above province, on the shore of the Mediterranean, 310 miles N.E. of Madrid by rail. No town in Spain has increased so rapidly in importance, extent, and population. The population was, in 1887, 272,480; with the suburbs of Gracia, San Andres de Palamor, and San Martin de Provençals, 421,255; in 1897, including the same suburbs, 504,396. This increase is not due to any unusual excess of birth-

rate, but chiefly to immigration from the rest of Spain. The influx has been occasioned by the extraordinary development of the industries and commerce of Barcelona since 1870. At the close of 1899 Barcelona paid about £550,000 in the shape of industrial and commercial taxes, being more than 11 per cent. of the whole amount of the said tax collected in the kingdom. Trades and industries give occupation to more than 150,000 hands of both sexes. There are powerful and numerous guilds and labour societies, and the principal trades union has enrolled more than 25,000 members. The spinning and weaving of wool, cotton, and silk are still its principal industries, but the enterprising spirit of the Catalans has impelled them to try almost every industry in which native capital could attempt to compete with foreign imports, especially since the institution of the protectionist tariffs of 1892. The prosperity has been in part due to the great development of means of communication around the city and in the four Catalan provinces. The city is the seat of the head offices of the Hispano-Colonial Bank, of the state-subsidized trans-Atlantic mail company, which has a splendid fleet of 50 steamers, and of several other great shipping companies. Its industrial companies are quite able to compete in peninsular markets with foreign rivals. The new part of the town has been adorned with splendid public promenades, parks, and public buildings. The older parts have been improved, and Barcelona has more numerous and better means of communication with its distant suburbs and environs than Madrid, in the shape of electric and steam tramways. Improvements have also been made in its port and quays, so much so, that during the Barcelona Exhibition of 1888 the fleets of ten European nations anchored inside the harbour or in the outer roadstead. During 25 years harbour duties have been levied to carry on the yet incomplete extension of the quays and harbour works.

The port of Barcelona is the most important in Spain. In 1898 3546 vessels of 2,796,367 tons (metric) entered, and 3885 of 2,743,725 tons (only 249 of 236,891 tons British) cleared: 2007 of the entrances and 1886 of the clearances were Spanish vessels, these high figures being largely due to the extent of the coasting trade. The imports from Great Britain were £1,670,568 in value in 1898, against £1,791,923 in 1897, the falling off being due to the coal strike in England and the high rates of exchanges during the war with the United States. The exports to England from Barcelona amounted in value to £126,320 in 1898, compared with £96,848 in 1897. The imports from British colonies in Asia and Africa were valued at £497,260 in 1898; exports to, at only £2947. Imports from France were valued at £476,171 in 1898; exports to, at £844,407, being an increase of £380,000 on the figures of 1897. Germany ranks next, exporting to Barcelona in 1898 goods valued at £502,413, and taking back to the value of £81,203. The war with the United States caused the imports from that country to drop from £2,512,915 in 1897 to £624,239 in 1898; but Barcelona obtained through other European markets the cotton that used to come direct from the States, as the value of cotton imported only dropped from £2,785,892 in 1897 to £2,349,384 in 1898. Comestibles, raw materials, and combustibles form the greater part of the imports, but this great manufactory singularly enough imports a considerable quantity of foreign manufactured goods, the most important items in this respect in 1898 being linen and jute goods, £268,784; woollen goods, £213,150; machinery, £230,219; and electric cables and dockyard materials, about £200,000. The principal exports are wines, cereals, olive oil, cotton goods, soap, cigarette-paper, furniture and barrels, boots, shoes and leather goods, machinery; but in almost every class there was a marked decline in 1898 compared with 1897, mainly attributable to the loss of the colonies, which falls especially heavy on Barcelona. The export of cotton goods declined £921,000 in value; soap and woollen goods each £20,000; shoes and leather goods £350,000. (A. E. H.)

Barcelona, a town of Venezuela, capital of the old state of Bermúdez (now capital of the state of Barcelona), close to the mouth of the river Neveri, and 12 miles from Guanta port by rail. At the beginning of the 19th century its population numbered 16,000

inhabitants, but is now only 9000. Among public buildings are Government house, the theatre, market, two hospitals, the Masonic temple, and several churches and educational institutions. It is an important commercial market.

Bareilly, or **BARELLI**, a city and district of British India, in the Rohilkhand division of the North-West Provinces. The city is situated on the Ramganga river, 788 miles north-west from Calcutta. The population in 1891 was 107,785, of whom more than half were Hindus; in 1901, 117,433. The municipality consists of thirty-seven members, of whom twenty-seven are elected, but no interest is taken in the elections. The municipal income in 1897-98 was Rs.1,19,226. The principal buildings are two mosques built in the 17th century; a modern fort overlooking the cantonments; the railway station, which is an important junction on the Oudh and Rohilkhand line; the palace of the Nawab of Rampur, and the Government college. Bareilly is the headquarters of a military division under a brigadier. The chief manufactures are furniture and upholstery. In 1896-97 the college had 123 students. There is also an efficient high school. There are ten printing-presses, and an Anjuman, or literary institute, with a library and reading-room. The death-rate in 1897 was 34.13 per 1000.

The district of **BAREILLY** has an area of 1595 square miles; it had a population in 1891 of 1,040,950, being 652 persons per square mile, and in 1901 of 1,089,550, showing an increase of 5 per cent. Classified according to religion, Hindus in 1891 numbered 790,479; Mahomedans, 245,073; Christians, 5271, of whom 2437 were Europeans (mostly soldiers); "others," 127. The land revenue and rates were Rs.15,56,303, the incidence of assessment being R.1:5:9 per acre; the number of police was 3055. In 1896-97, out of a total cultivated area of 718,604 acres, 74,292 were irrigated from the Rohilkhand system of Government canals, and 94,045 from wells, tanks, &c. There are no manufactures except for domestic use, and little external trade. Several lines of the Oudh and Rohilkhand railway pass through the district.

Barentin, a town in the arrondissement of Rouen, department of Seine Inférieure, France, 11 miles N.W. of Rouen, with station on the railway from Paris to Havre. The town is situated in the valley of the Austreberte, a small affluent of the Seine, here crossed at a height of 100 feet by a fine railway viaduct, 540 yards long. The manufacture of cotton fabrics is the principal industry. Population (1896), 4413, comm., 5082.

Barguzin, a district town of East Siberia, province of Transbaikalia, on the Barguzin river, 27 miles from its entrance into Lake Baikal. It is situated in a large longitudinal valley which runs at the foot of the border range of the Vitim plateau, and ends in a wide prairie. Important gold mines are worked in its district; hot mineral waters are near to the town, at Turka. Population (1897), 1380.

Bar Harbor, a well-known summer resort in Hancock county, Maine, U.S.A., situated on the west shore of Frenchman Bay, on the east side of Mount Desert Island.

Bari, a seaport town, archiepiscopal see, and capital of the province of Bari, Apulia, Italy, on the Adriatic, 69 miles N.W. from Brindisi by rail. The citadel is now used as a prison. The Athenæum contains a technical school and the provincial museum. University classes are held here; and there is a nautical school. Bari is the seat of active industries—engineering works and foundries, olive-oil mills, and cooperages being the most important. The men make excellent sailors. The harbour on the west of

the town has been improved since 1893; its depth varies from 11½ to 28 ft. The old harbour, on the E., is only used by fishing-boats. The exports average £2,279,700 annually (£2,521,700 in 1899); the imports £1,185,800 (£1,418,200 in 1899). The former consist principally of olive oil, wine, almonds, and cream of tartar. The shipping entering the port increased from 945 vessels of 430,242 tons in 1888 to 1789 vessels of 945,400 tons in 1899 (77 vessels of 98,780 tons being British). Population, of town (1881), 60,575; (1901), 79,693; of province (1881), 679,497; (1901), 823,998.

Barili, a town of 21,000 inhabitants, on the west coast of Cebu, Philippine Islands, in latitude 10° 16' N. It has a relatively cool and healthful climate. Its people are agriculturists and raise Indian corn, sibucac, hemp, cacao and coffee. The language is Cebu-Visayan.

Baring Land. See NORTH-WEST TERRITORIES.

Barisal, a town of British India, headquarters of Backergunje district in Bengal, is situated on a river of the same name. Population, about 15,500. It is an important centre of river trade, on the steamer route through the Sundarbans from Calcutta to the Brahmaputra. It contains two colleges, opened without aid from government, and an English high school. There are four printing-presses, which issue two vernacular newspapers; a public library, established by subscription in 1858; and a students' union, for helping the sick and poor and promoting the intellectual and physical improvement of boys. Barisal has given its name to a curious physical phenomenon, known as the "Barisal guns," the cause of which has not yet been satisfactorily explained. These are noises, like the report of cannon, frequently heard in the channels of the delta of the Brahmaputra.

Barka. See TRIPOLI.

Barking, a market town and railway station in the Romford parliamentary division of Essex, England, on the Roding, near the Thames, 7 miles E. of Whitechapel church. Ilford, which was once a ward of Barking parish, was separated from the town in 1888, and now forms a civil parish under the metropolitan police. Victoria Gardens and a recreation ground have been opened, public baths erected, and the electric light installed. The Gaslight and Coke Company's works at Becton are in the parish, and also Warne and Company's rubber works, formerly of Tottenham, and both works employ a large number of hands, who reside in the town. Area, 3814 acres; population (1881), 9203; (1891), 14,301; (1901), 21,511.

Barkly, two towns in Cape Colony:—1. *Barkly East* lies in an upland valley near the river Kraal, which joins the left bank of the Orange a short distance above Aliwal North, and has an estimated population of over 2000; 2. *Barkly West*, formerly *Klip-drift*, stands on the right bank of the Vaal opposite Pniel in Griqualand West, about 24 miles to the north-west of Kimberley, and was the site of the first diamonds from river-diggings, which between 1870 and 1886 yielded stones to the total value of over £2,000,000, but are now nearly exhausted. The diamonds of this district are noted for their purity and lustre, and are generally associated with other crystals,—garnets, agates, quartz, and chalcedonies. After the discovery of the Kimberley diamond fields most of the Vaal diggings were abandoned, and the population of Barkly has fallen from about 4000 to less than 2000.

Barletta, a fortified seaport town and archiepiscopal see of the province of Bari, Apulia, Italy, on the S. shore of the Gulf of Manfredonia, 42 miles E.S.E. from Foggia. In 1887 it had an export trade in wine (90 per cent.), brandy, and tartaric acid of the aggregate value of £1,655,000.

By 1895 this had declined to a total of only £137,000, but since then it has increased again (£276,600 in 1899). The port is cleared by an average of 440 vessels of 294,500 tons annually. The chief industry is the manufacture of tartaric acid. Population (1881), 31,994; (1900), 44,891.

Barmen, a town in the Rhine province, Prussia, immediately E. of Elberfeld, 35 miles E. from Düsseldorf by rail. Its industries are identical with those of Elberfeld, with which it virtually makes one town. A pantheon or hall of glory (1900) is destined to contain statues of the Emperors William I. and Frederick III., the municipal library, the collections of the Berg Historical Society, and those of the Barmen Art Association. There are also a new concert hall and a monument of the 1870-71 war. Population (1890), 116,144; (1900), 141,947.

Barnard Castle, a market town and railway station, in the Barnard Castle parliamentary division of Durham, England, on the Tees, 15 miles W. of Darlington. Recent erections are a large county school, two Methodist chapels, and a fever hospital. The Bowes Museum has been extended and endowed. Area of township, 7790 acres; population (1881), 4269; (1891), 4725. Area of urban district, 533 acres; population (1881), 4096; (1901), 4421.

Barnby, Sir Joseph (1838-1896), English musical composer and conductor, was born at York on 12th August 1838. He was a chorister at York Minster from the age of seven, was educated at the Royal Academy of Music under Cipriani Potter and Charles Lucas, and was appointed in 1862 organist of St Andrew's, Wells Street, London, where he raised the services to a high degree of excellence. He was conductor of "Barnby's Choir" from 1864, and in 1871 was appointed, in succession to Gounod, conductor of the Albert Hall Choral Society, a post he held till his death. In 1875 he was precentor and director of music at Eton, and in 1892 became principal of the Guildhall School of Music, receiving the honour of knighthood in July of that year. His works include an oratorio, *Rebekah*, Ps. xcvi., many services and anthems and hymn-tunes, as well as some part-songs (among them the popular "Sweet and Low"), and some pieces for the organ. As a conductor he possessed the qualities as well as the defects of the typical north-countryman; if he was wanting in the higher kind of imagination or ideality, he infused into those who sang under him something of his own straightforward rectitude and uncompromising precision. He was largely instrumental in stimulating the love for Gounod's sacred music among the less educated part of the London public, although he displayed little practical sympathy with opera, the branch of art in which Gounod's best powers were manifested. On the other hand, he organized a remarkable concert performance of *Parsifal* at the Albert Hall in London in 1884. He conducted the Cardiff Festivals of 1892 and 1895. He died in London on the 28th of January 1896.

(J. A. F. M.)

Barnes, William (1800-1886), the Dorsetshire poet, was born 22nd February 1800, at Rushay, near Pentridge in Dorset, the son of John Barnes and Grace Scott, of the farmer class. He was a delicate child, in direct contrast to a strong race of forebears, and inherited from his mother a refined, retiring disposition and a love for books. He went to school at Sturminster Newton, where he was considered the clever boy of the school; and, when a solicitor named Dashwood applied to the master for a quick-witted boy to join him as pupil, Barnes was selected for the post. He was therefore apprenticed to the law,

and worked with the village parson in his spare hours at classics, and studied music under the organist. In 1818 he left Sturminster for the office of one Coombs at Dorchester, where he continued his evening education with another kindly clergyman. He also made great progress in the art of wood-engraving, and with the money he received for a series of blocks for a work called *Walks about Dorchester*, he printed and published his first book, *Orra, a Lapland Tale*, in 1822. In the same year he became engaged to Julia Miles, the daughter of an excise officer. In 1823 he took a school at Mere in Wiltshire, and four years later married and settled in Chantry House, a fine old Tudor mansion in that town. The school grew in numbers, and Barnes occupied all his spare time in assiduous study, reading during these years authors so diverse in character as Herodotus, Sallust, Ovid, Petrarch, Buffon, and Burns. He also began to write poetry, and printed many of his verses in the *Dorset County Chronicle*. His chief studies, however, were philological; and in 1829 he published *An Etymological Glossary of English Words of Foreign Derivation*. In 1832 a strolling company of actors visited Mere, and Barnes was so pleased by their performance that he wrote a farce, *The Honest Thief*, which they produced, and also a comedy which was played at Wincanton. Barnes also wrote a number of educational books, such as *Elements of Perspective*, *Outlines of Geography*, *An Essay on the Advantages of the Study of Mathematics*, and in 1833 first began his poems in the Dorsetshire dialect in the pages of the local paper. In 1835 he left Mere and returned to Dorchester, where he started another school, which, after its removal in 1837 into more commodious quarters, flourished satisfactorily. The year 1844 is a landmark in Barnes's life, for it was then that he published his first series of Dorsetshire poems. They made considerable literary success, the Hon. Mrs Norton busying herself with the advocacy of their claims. Three years later Barnes took holy orders, and was appointed to the care of Whitcombe, three miles from Dorchester. He had been for some years upon the books of St John's College, Cambridge, and took the degree of B.D. in 1850. He resigned Whitcombe in 1852, finding the work too hard in connexion with his mastership; and in June of that year he lost his wife, whom he never ceased to mourn with an intensity of devotion. Continuing his studies in the science of language, he published his *Philological Grammar* in 1854, a remarkable compilation, drawing examples from more than seventy languages. For the copyright of this erudite work he received £5. The second series of dialect poems, *Homely Rhymes*, appeared in 1857, and the third in 1863. *Homely Rhymes* contained some of his best-known pieces, and in the year of its publication he first began to give readings from his works, which were extremely successful. As their reputation grew he travelled all over the country, delighting large audiences with his quaint humour and natural pathos. In 1861 he was awarded a civil list pension of £70 a year, and at the close of the same year published *Tiw*, the most striking of his philological studies, in which an attempt is made to trace the English language to a Teutonic origin. In the next year he broke up his school, and removed to the rectory of Winterborne Came, to which he was presented by his old friend, Captain Damer. Here he worked continuously at verse and prose, contributing largely to the magazines. He was persuaded in 1868 to publish a series of *Poems of Rural Life* in ordinary English, but he was less successful in verse which abandoned dialect. His poems were collected into a single volume in 1879, and on 11th October 1886 he died at Winterborne Came. Barnes's poetry is

essentially English in character; no other writer has given quite so simple and sincere a picture of the homely life and labour of rural England. His work is full of humour and the clean, manly joy of life; and its rusticity is singularly allied to a literary sense and to high technical finish. He is indeed the Victorian Theocritus; and, as English country life is slowly swept away before the advance of the railway and the telegraph, he will be more and more read for his warm-hearted and fragrant record of rustic love and piety. (A. WA.)

Barnet.—Three English towns in the St Albans parliamentary division of Hertfordshire bear this name: (1) CHIPPING or HIGH BARNET, a market town 11 miles north of London by rail; population of parish (1881), 4283; (1891), 4563. (2) EAST BARNET, a village 2 miles south of the above; population of East Barnet Valley urban district (1891), 7715; (1901), 10,094. (3) NEW BARNET, a town formed by portions of the two preceding parishes, with a station 9 miles north of London. The urban district of Barnet has an area of about 690 square miles, and had a population of 6437 in 1891 and 7876 in 1901.

Barnfield, Richard (1574-1627), an English poet, whose obscure though close relationship with Shakespeare has long made him interesting to students, has attracted of late years further attention from the circumstance that important discoveries regarding his life have been made. Until recently nothing whatever was known about the facts of Barnfield's career, whose very existence had been doubted. It was, however, discovered by the late Dr Grosart that the poet was the son of Richard Barnfield (or Barnefield) and Maria Skrymsher, his wife, who were married in April 1572. They resided in the parish of Norbury, in Staffordshire, on the borders of Salop, where the poet was baptized on the 13th of June 1574. The mother died in giving birth to a daughter early in 1581, and her unmarried sister, Elizabeth Skrymsher, seems to have devoted herself to the care of the children. In November 1589 Barnfield matriculated at Brasenose College, Oxford, and took his degree in February 1592. He "performed the exercise for his master's gown," but seems to have left the university abruptly, without proceeding to the M.A. It is conjectured that he came up to London in 1593, and became acquainted with Watson, Drayton, and perhaps with Spenser. The death of Sir Philip Sidney had occurred while Barnfield was still a school-boy, but it seems to have strongly affected his imagination, and to have inspired some of his earliest verses. In November 1594, in his twenty-first year, Barnfield published anonymously his first work, *The Affectionate Shepherd*, dedicated with familiar devotion to Lady Penelope Rich. This was a sort of florid romance, in two books of six-line stanza, in the manner of Lodge and Shakespeare, dealing at large with "the complaint of Daphnis for the love of Ganymede." As the author expressly admitted later, it was an expansion or paraphrase of Virgil's second eclogue—

"Formosum pastor Corydon ardebat Alexin."

This poem of Barnfield's was the most extraordinary specimen hitherto produced in England of the license introduced from Italy at the Renaissance. Although the poem was successful, it did not pass without censure from the moral point of view. Into the conventional outlines of *The Affectionate Shepherd* the young poet has poured all his fancy, all his epithets, and all his coloured touches of nature. If we are not repelled by the absurd subject, we have to admit that none of the immediate imitators of *Venus and Adonis* has equalled the juvenile Barnfield in the picturesqueness of his "fine ruff-footed doves," his "speckled flower call'd sops-in-wine," or his desire "by

the bright glimmering of the starry light, to catch the long-bill'd woodcock." Two months later, in January 1595, Barnfield published his second volume, *Cynthia, with certain Sonnets*, and this time signed the preface, which was dedicated, in terms which imply close personal relations, to William Stanley, the new Earl of Derby. This is a book of extreme interest; it exemplifies the earliest study both of Spenser and Shakespeare. "*Cynthia*" itself, a panegyric on Queen Elizabeth, is written in the Spenserian stanza, of which it is probably the earliest example extant outside *The Faerie Queene*. This is followed by a sequence of twenty sonnets, which have the extraordinary interest that, while preceding the publication of Shakespeare's sonnets by fourteen years, they are closer to them in manner than are any others of the Elizabethan age. They celebrate, with extravagant ardour, the charms of a young man whose initials seem to have been J. U. or J. V., and of whom nothing else seems known. These sonnets, which preceded even the *Amoretti* of Spenser, are of unusual merit as poetry, and would rank as high in quality as in date of publication if their subject-matter were not so preposterous. They show the influence of Drayton's *Idea*, which had appeared a few months before; in that collection also, it is to be observed, there had appeared amatory sonnets addressed to a young man. If editors would courageously alter the sex of the pronouns, several of Barnfield's glowing sonnets might take their place at once in our anthologies. Before the publication of his volume, however, he had repented of his heresies, and had become enamoured of a "lass" named Eliza (or Elizabeth), whom he celebrates with effusion in an "Ode." This is probably the lady whom he presently married, and as we find him a grandfather in 1626, it is unlikely that the wedding was long delayed. In 1598 Barnfield published his third volume, *The Encomion of Lady Pecunia*, a poem in praise of money, followed by a sort of continuation, in the same six-line stanza, called "The Complaint of Poetry for the Death of Liberality." In this volume there is already a decline in poetic quality. But an appendix of "Poems in diverse Humours" to this volume of 1598 presents some very interesting features. Here appears what seems to be the absolutely earliest praise of Shakespeare in a piece entitled "A Remembrance of some English Poets," in which the still unrecognized author of *Venus and Adonis* is celebrated by the side of Spenser, Daniel, and Drayton. Here also are the sonnet, "If Music and sweet Poetry agree," and the beautiful ode beginning, "As it fell upon a day," which were until recently attributed to Shakespeare himself. In the next year, 1599, *The Passionate Pilgrim* was published, with the words "By W. Shakespeare" on the title-page. It was long supposed that this attribution was correct, but Barnfield claimed one of the two pieces just mentioned, not only in 1598, but again in 1605. It is certain that both are his, and possibly other things in *The Passionate Pilgrim* also; Shakespeare's share in the twenty poems of that miscellany being doubtless confined to the five short pieces which have been definitely identified as his. In the opinion of the present writer, the sonnet beginning "Sweet Cytherea" has unmistakably the stamp of Barnfield, and is probably a gloss on the first rapturous perusal of *Venus and Adonis*; the same is to be said of "Scarce had the sun," which is *aut Barnfield, aut diabolus*. One or two other contributions to *The Passionate Pilgrim* may be conjectured, with less confidence, to be Barnfield's. It has been stated that the poet was now studying the law at Gray's Inn, but for this the writer is unable to discover the authority, except that several members of that society are mentioned in the course of the volume of 1598. In all probability Barnfield now married and with-

drew to his estate of Dorlestone (or Darlaston), in the county of Stafford, a house romantically situated on the river Trent, where he henceforth resided as a country gentleman. In 1605 he reprinted his *Lady Pecunia*, and this was his latest appearance as a man of letters. His son Robert Barnfield and his cousin Elinor Skrymsher were his executors when his will was proved at Lichfield; his wife, therefore, doubtless predeceased him. Barnfield died at Dorlestone Hall, and was buried in the neighbouring parish church of St Michael's, Stone, on the 6th of March 1627. The labours of Dr Grosart and of Professor Arber have thrown much light on the circumstances of Barnfield's career. He has taken of late years a far more prominent place than ever before in the history of English literature. This is due partly to the remarkable merit of his graceful, melodious, and highly-coloured verse, which was practically unknown until it was privately printed in 1876 (Grosart), and at length given to the public in 1882 (Arber). It is also due to the mysterious personal relation of Barnfield to Shakespeare, a relation not easy to prove in detail, as it is built up on a great variety of small indications. It is, however, obvious that Barnfield warmly admired Shakespeare, whose earliest imitator he may be said to have been, and that between 1595 and 1600 the younger poet was so close to the elder that the compositions of the former could be confused with those of the latter. Barnfield died, as a poet, in his twenty-fifth year. Up to that time he had displayed a talent which, if he had pursued it, might have placed him very high among the English poets. As it is, he will always interest a certain number of readers as being, in his languid "Italianate" way, a sort of ineffectual Meleager in the rich Elizabethan anthology. (E. G.)

Barnsley, or Black (more properly Bleak) Barnsley, a municipal borough in the Barnsley parliamentary division of Yorkshire, England, 15 miles N. of Sheffield. The borough received a separate commission of the peace in 1895. Modern erections are a church, a new court-house, a public hall, an institute, and a free library (cost about £27,000). The hospital has been enlarged. Area, 2386 acres; population (1881), 29,790; (1891), 35,427; (1901), 41,083.

Barnstaple, a municipal borough, port, and market town, in the Barnstaple parliamentary division (since 1885) of Devonshire, England, on the Taw, 6 miles from its mouth, and 40 miles N.W. of Exeter by rail. The ancient church of St Peter and St Paul has been restored, that of St John the Baptist enlarged, and the infirmary twice extended. Registered shipping in 1900, 43 vessels of 1915 tons; in 1899, 3202 vessels of 212,873 tons entered, and 3167 of 210,822 tons cleared. Area of municipal borough, 1837 acres. Population (1881), 12,282; (1891), 13,058; (1900), 14,137.

Baro River. See NILE.

Baroda, a native state of India, within the Gujarat province of Bombay, but in direct relations with the governor-general. It consists of four isolated divisions, each of which is surrounded by British territory or by other native states. Three of these—Kari, Baroda, and Nausari—are in Gujarat proper; the fourth, Amreli with Okhamandal, is in the peninsula of Kathiawar. The total area covers 8226 square miles. In 1881 the population was 2,185,005; in 1891 it was 2,415,346, giving an average density of 294 persons per square mile, compared with 301 for the Gujarat division of Bombay. Classified according to religion, Hindus numbered 2,137,568; Mahomedans, 188,740; Jains, 50,332; Parsis, 8206; Christians, 646; aborigines, 29,854. In 1901 the population was 1,950,927, showing a decrease of 19 per cent.,

compared with an increase of 11 per cent. in the preceding decade.

The last Gaekwar, Mulhar Rao, was deposed in 1875 for gross misgovernment; but the widow of his brother and predecessor, Khande Rao, was permitted to adopt an heir from among the descendants of the founder of the family. This heir, by name Sayaji Rao, then a boy of twelve years, was educated by an English tutor, the administration being meanwhile placed for eight years under the charge of the late Sir Madhava Rao, formerly Diwan of Travancore, one of the ablest and most enlightened of Indian statesmen. The result was a conspicuous success. The Gaekwar has been a model prince, and his territories are as well governed and prosperous as a British district. He has repeatedly visited Europe in company with his wife. In 1887 the Queen-Empress conferred upon him at Windsor the insignia of G.C.S.I., and in 1892 upon his wife the Imperial order of the Crown of India.

In 1894-95 the gross revenue amounted to Rs. 1,68,14,810, or more than a million sterling. The total expenditure was Rs. 1,62,36,227. The amount of silver coined in 1894-95 was Rs. 31,80,000; but in 1901 the state currency of Babashai rupees was withdrawn, and the British rupee was introduced. The regular military force consists of 1 field battery, 4 regiments of cavalry, and 5 battalions of infantry: total strength, 5000 men, of whom 13 are Europeans. In addition, there is an irregular force of 2000 horse and 1800 foot. The police numbers 4304 men, being 1 for every 547 of the population. In 1897-98 the total number of vernacular schools was 1356, attended by 78,101 boys and 14,892 girls. The proportion of boys at school to those of school-going age is 42 per cent., compared with 27 per cent. for the Bombay presidency; and the proportion of girls 7·2 per cent., compared with 4·2 per cent. For a few years compulsory education has been enforced in 30 villages of the Amreli division with apparent success, the compulsory age being 7 to 12 for boys and 7 to 10 for girls. Special measures are also adopted for the education of low castes and aboriginal tribes. There is a female training college under a Christian lady superintendent. In 1894-95 the Baroda college was attended by 164 students. There were 2 high schools, 13 Anglo-vernacular schools, and 5 aided schools, with a total of 5334 pupils, of whom 51 passed the matriculation. The Kala Bhavan, or technical school, with departments for drawing, carpentry, dyeing, weaving, and agriculture, was attended by 139 students. There is also a state museum under a European director, and a state library of about 6000 volumes. The number of hospitals and dispensaries is 51, which were attended in 1894-95 by 5837 indoor and 339,844 outdoor patients. Portions of the state are crossed by the Bombay and Baroda and the Rajputana railways. In addition, the state has constructed three railways of its own, on three different gauges: total length, 177 miles. Other railways are in contemplation. The state supports a cotton mill, with 260 looms and 12,734 spindles, employing 600 hands. Baroda has suffered considerably from the plague, the total number of deaths down to July 1897 having been 2950; and also from the famine of 1899-1900, the persons in receipt of relief averaging about 60,000 a month.

The city of BARODA is situated in 22° 17' N. lat. and 73° 16' E. long., on the river Viswamitri, a station on the Bombay and Baroda railway, 247 miles north of Bombay. The population in 1881 was 106,512; in 1891 it was 116,420; and in 1901 it was 103,782. The municipal area is about 8 square miles, giving a density of 14,059 persons per square mile. The municipal expenditure in 1894-95 was Rs. 2,69,273, almost entirely contributed by the state. The whole aspect of the city has been

changed by the construction of handsome public buildings, the laying-out of parks, and the widening of the streets. An excellent water-supply is provided from the Ajwa lake. The cantonments, garrisoned by a native infantry regiment, are under British jurisdiction, and have a population of 4000. They contain an Anglo-Indian school, and 2 vernacular schools for boys and girls. In 1894-95 the Baroda high school was attended by 560 boys, of whom 38 passed the Bombay matriculation; and the Anglo-vernacular school by 351 boys. There are also 31 vernacular schools, with 4984 pupils. The chief hospitals are called after the countess of Dufferin, Jamnabai, and Sayaji Rao, with a total of 2856 indoor patients. (J. S. Co.)

Barotse.—This is the name given to a country and a people in South-Central Africa. The name is sometimes spelt Barutse, and is said to be derived from a corruption of Bahurutse, the name of a Bechuana tribe. The word is also given with a different plural prefix as Marotse. It will probably survive for general use in the form which heads this article. Barotseland lies along both banks of the upper Zambezi, from the junction of the Kabompo and the Liambai to the junction of the Kwando and the main Zambezi at Kasungula. Politically, it may be also held to include the adjoining countries inhabited by the Batoka and the Bashukulumbwe—in short, the basins of the upper Zambezi and of the Kafue rivers. On the north it is bounded by Portuguese West Africa and the Congo Free State, on the east by British Central Africa (of which it is sometimes considered to form a geographical part), on the south by Rhodesia, and on the west by the German and Portuguese possessions. Barotseland proper is the very marshy and unhealthy country along the banks of the upper Zambezi, which at certain seasons of the year spreads its floods far and wide. The extreme north of Barotseland is densely forested; elsewhere trees are few and far between. The Batoka and the Bashukulumbwe countries chiefly consist of plateaux with an average elevation of about 2500 feet, here and there rising into hills and mountain ranges of no great altitude. The river Kafue, which is also known as the Kafukwe and the Luenge, is the second most important river of Barotseland, and is by some geographers considered to have been the original head-waters of the Zambezi, in the days before the present upper Zambezi by means of the crack known as the Victoria Falls was deflected towards the Indian Ocean.

The indigenous Negro race of Barotseland proper is known as the Baloi or Balui. They are Bantu Negroes, speaking dialects more nearly related to those of the southern Congo basin than to the Zambezi tongues. Their country was invaded in the early part of the 19th century by ravagers from Bechuanaland across the Zambezi, a people who generally went by the name of Mokololo, but who eventually adopted the term Barotse. These Bechuana conquered Barotseland, and ruled it for about forty years, when an uprising among the indigenous Baloi drove them from power and replaced them by a native dynasty. Nevertheless, Bechuana influence in the country is very marked, and for some time the Bechuana language was the Court tongue. The present king of Barotseland is named Lewanika, and his capital city on the upper Zambezi is Lialui. Lewanika is a very enlightened monarch as African princes go, and rules his country with wisdom, and much under the advice of a Resident of the British South Africa Company and of French Protestant missionaries, who have long been settled in the country. Lewanika's hold upon the Batoka and the Bashukulumbwe is very dubious, but it is probable that for political purposes it may be strengthened, as the best means of bringing

these wild tribes under reasonable subjection. There is a good deal of the West African strain in the manners and customs, trade and religion, of the Barotse, or more properly speaking, of the Baloi. Having, however, for many years past (from the Bechuana invasion and the settlement of the French Protestant missionaries) been brought into connexion with British South Africa commercially, and finally politically, there is a certain amount of "Cape" influence in the new civilization which is springing up. On the other hand, the Batoka, and still more the Bashukulumbwe, are in a completely savage state. The men go absolutely naked (as was formerly the case with allied tribes in West Nyasaland) and wear their hair with artificial additions in a tremendously long peak which is drawn to a fine whip-like point. Physically, they are a fine, handsome race, though the Barotse are not so, resembling rather the West African Negroes in appearance. It is probable that the Bashukulumbwe are in remote origin nearly allied to the Zulu Kaffirs. The Batoka and Bashukulumbwe country is fairly healthy, and adapted for European settlement as much as the Rhodesian territory to the south. On the other hand, Barotseland proper is exceedingly unhealthy, and quite unfitted for European occupation. In flora and fauna Barotseland is closely connected with British Central Africa, though in the north-west there is a marked infusion of West African forms. Politically, the country lies within the limits of the British Empire. It remains under the government of its king, but the British South Africa Chartered Company has by treaty a certain interest in its government, and maintains a Resident at the court of King Lewanika. For geographical reasons it is probable that Barotseland will one day form part of the South African congeries of states, and will be administered quite independently of its eastern neighbour, British Central Africa, which in peoples, languages, history, and methods of administration tends much more towards Eastern Africa and Zanzibar.

Barquisimeto, capital of the state of Lara, in Venezuela, in a valley, 1711 feet above the level of the sea. Its population numbers 40,000. It is an important commercial centre, having great facilities for communication with the states of Carabobo, Zamora, and Falcón, and is connected by rail with the port of Tucacas. It is the seat of an episcopal chair, has many colleges and schools, both public and private, hospitals, &c. The main buildings are the Government palace, the barracks, the market, the cathedral, and several other churches.

Barrackpore, or NORTH BARRACKPORE, a town of British India, in the Twenty-four Parganas district of Bengal, lies on the left bank of the Hooghly, 15 miles above Calcutta. Population, about 21,000. It is the largest cantonment in Lower Bengal, having accommodation for two batteries of artillery, the wing of a European regiment, and two native battalions. It is a station on the Eastern Bengal railway. A fine park along the river contains the country residence of the Viceroy. The English high school was attended in 1896-97 by 201 pupils.

Barracks.—Barracks are necessary accompaniments of a standing army. As long as operations in the field were carried on by means of troops levied especially for the war in hand, no barracks apart from fortifications

were required except those for the royal body-guard; and even after the standing army exceeded those limits, the necessity for additional barracks was often avoided by having recourse to the device of billeting, *i.e.*, quartering the soldiers on the populations of the towns where they were posted. This, however, was a device burdensome to the people, subversive of discipline, and prejudicial to military efficiency in many ways, while it exposed the scattered soldiers to many temptations to disloyalty. Hence, instead of billeting soldiers, there were gradually provided for them barracks, which, in the case of the British empire, were first erected at stations where such an arrangement was most necessary owing to the paucity of the population, or where concentration of troops was most important owing to the disaffection of some of the inhabitants. These barracks sometimes formed part of fortifications and their character was subordinate to considerations of defence. Generally, however, they were separate, and it is such only that are dealt with in this article.

It was in France, where, in the reign of Louis XIV., provision had to be made for the housing of a huge standing army, that barracks were first built upon an organized plan. In 1680 Vauban devised and introduced a system of barrack construction which became universally adopted in France, and maintained its position there for nearly two centuries. Its leading features may be briefly described as follows:—The barrack was a square building

**Conti-
nental
systems.**

of masonry of two or more storeys, with a courtyard in the centre. Staircases connected from the ground with each floor. On either side of the staircase-landings two parallel barrack rooms opened—the one lying to the front and the other to the back (the courtyard side), separated from each other by a stout partition wall. These wards were the barrack rooms of the men for all purposes—living, sleeping, eating, and the furbishing of accoutrements. In process of time the partition wall was removed, and both rooms being thus thrown into one, better ventilation was gained. After an unbroken existence of nearly two centuries the “Vauban” system was modified by that known as the “Belmas,” which introduced a corridor in place of the discarded partition wall. The evils attendant upon this change in internal construction were, from the hygienic point of view, soon apparent. Not only was the corridor dark and incapable of ventilation, but there was a constant interchange of effluvia from one ward to the other through the doors opening into the passage, and the result was soon seen in increased sickness and mortality. Germany and Austria followed in the main the Spanish system, the characteristics of which were an open gallery running round the courtyard quadrangle on every floor, upon which the barrack rooms opened.

The year 1874 inaugurated a new era in barrack construction for the two leading military nations of Europe. With the lessons of the field hospitals in the Franco-German war fresh upon them, and in view of the beneficial results attained in them, each country set itself to work to devise a better sanitary system of housing troops than had hitherto obtained. A new departure was made from the quadrangular systems above described. The “Front” system was now introduced, and became almost universally adopted in the case of new erections. Barracks were now built upon the following plan:—The main building was an oblong front block of at most three storeys, with wings running back at each end, but not exceeding in depth one-third of the frontage. The advantages of this system were increased light and air, and the greater facility afforded for keeping outhouses, such as latrines, wash-houses, kitchens, and harness rooms, away from the living and sleeping accommodation for the men.

The floor- and air-space allotted to each man in the German barracks under the new system is about 550 cubic feet air-space and 49 square feet floor-space. Barracks on this plan have been built in France to accommodate as many as 5000 men under one roof. But perhaps the most perfect arrangement of the kind is to be found in Dresden. The so-called “Albertstadt,” situated about two miles from the centre of that city, consists of seven or more of such barracks, erected on a spacious and even sumptuous scale, with a total frontage of close upon two miles. Indeed, it is only in Germany and in the United States of America where as yet provision has been made for separate living and sleeping accommodation for the soldiers. But in spite of all that the best architects and builders could devise, it has been found, even in the model “Albertstadt” of Dresden, that the sanitary conditions of any system of complete centralization leave much to be desired, as compared with the decentralization exemplified in the pavilion system, which was first established in England after the Crimean war. A somewhat similar system to this, known as the *Tollet*, was introduced in France in 1875, going further in the direction of decentralization even than the English. Its main characteristics are the following:—1. Every pavilion to be of one storey, to have a pitched roof, and to contain at most seventy men. 2. The blocks to be built on stone foundations, and the structure of iron skeleton framework filled in with non-porous bricks. The materials used to be non-inflammable, and capable of being thoroughly cleansed. 3. The blocks to be built outside towns, and 55 square yards space to be allowed per head within the area assigned to the whole of the barrack erections, whilst in the barrack rooms 33 square feet floor-space and 760 cubic feet air-space are allowed for each foot soldier, and 41 square feet floor-space and 860 cubic feet air-space for each trooper. 4. Each block to have separate wash-houses and latrines; whilst the furniture of all rooms must be such as permits of thorough and rapid cleansing and disinfecting. 5. Every block has in the centre an ante-room fitted with all appliances for washing, whilst to the right and left lie the barrack rooms, each 63 feet long and 21 feet broad, lighted by eight large windows, and with ventilators in the roof. At the end of each ward are two rooms occupied by the under-officers responsible for the discipline and general supervision of the rooms. The hygienic results of this change of barrack system in France have been considered very satisfactory.

British Army.—The earliest barracks of which there is record, as regards England, were those for the royal body-guard, *i.e.*, those for the foot-guards, erected in 1660. Among the earliest of those still existing were the Royal Barracks at Dublin, dating from the beginning of the 18th century, about which time barracks were built in several parts of Ireland, but the great barrack-building era in England was the end of the 18th and the beginning of the 19th century, *i.e.*, during the great wars with France. That period saw the erection of a very large number of barracks in towns in Great Britain and Ireland and in the colonies. Communication being slow and difficult, while there was much distress owing to the war, and consequently frequent riots, the barracks were generally placed in large or market towns, where the troops could be most easily supplied, where they would be at hand for putting down disturbances, and where recruits could be most readily obtained. Few barracks were built on a large scale during the next forty years, but the same policy held the field, in spite of the introduction of railroads and steamships, the invention of the electric telegraph, and the establishment of organized and efficient police forces. On the other hand, those forty years

were a critical period. Apart from the violence of strikes and anti-machinery riots, and the excitement of parliamentary elections, there was the tension caused by the Roman Catholic Emancipation Bill, the great Reform Bill, and the abolition of the Corn Laws, besides the catastrophe of the Irish famine, and the Chartist upheaval of 1848, while the effect of the fundamental alteration in the matter of communication had not as yet been fully realized.

The Crimean war and the adoption of rifled guns and small arms brought about a great change. It was recognized that, after the necessary garrisons of fortresses had been provided for, the leading principle of barrack policy must in the future be to facilitate in peace time the training of the army for war; and that this could only be done by barracking troops in large bodies, including all branches of the service, in positions where they would have space for training, gun and rifle practice, and manoeuvring. The camps at Aldershot, Colchester, Shorncliffe, and Curragh were accordingly started between 1856 and 1860, and the same policy has been since pursued by the acquisition of Strensall Common, near York, Kilworth domain, near Fermoy, the lease of a portion of Dartmoor and a large area at Glen Maal, county Wicklow, for the Horse and Field Artillery, and finally the purchase of a great part of Salisbury Plain. It is not at all these places that there are or will be regular barracks. In some cases the troops are encamped while training; but the principle remains that, when permanent barracks are built, they should as a rule be for a force of all arms in a locality where they can be trained. With the present means of communication support to the civil power in case of disturbances can always be afforded in time, without permanently stationing troops in the actual locality where their assistance may be needed.

Unfortunately, however, the old barracks, such as those of the beginning of the 19th century, exist in many towns, and for economy's sake must for the present be utilized. These barracks were built before the true principles of sanitary science were known, and the health of the troops stationed in them was very bad, while the accommodation they afforded was insufficient in many respects. Hardly any provision was made for married men, who were generally placed with their wives and families in ordinary barrack rooms, the space allowed for four single soldiers being allotted to each family, with no privacy beyond that afforded by screens of blankets erected by the occupants. Even for single men the accommodation was inadequate, the space allowed per man being seldom over 450 cubic feet, and sometimes as low as 258 feet, while most of the rooms had windows only on one side, and there were no special means of ventilation. The latrines were often mere privies; the ablution arrangements were very rough, and baths there were none, while the only means of cooking provided for the soldiers was by boiling. There was no sergeants' mess or recreation establishment, while the accessories that were provided were far short of the modern standard. The buildings were often arranged so as to interfere with the proper circulation of air, and the drainage was almost invariably bad.

The result of this state of affairs was disastrous. As late as 1857 the annual rate of mortality in the army at home per 1000 men was 17·5, while the rate among the civil male population of corresponding ages was only 9·2. Contrast with this the rate of mortality in the army at home forty years later, in 1897, which was only 3·42 per 1000. It is not contended that improvement in barracks was the only factor in thus reducing mortality. There have been other causes at work, such as better clothing, better food and cooking, greater temperance, education, amusements, careful supervision of health, and the introduction of short service; but still, the most effectual cause has probably been the improvement in barrack accommodation. The disasters of the Crimean war directed public attention to the health of the army, and resulted in the appointment of the

Reforms. "Official Committee on Barrack Accommodation for the Army," presided over by Viscount Monk, M.P., which reported in 1855. This was followed by a Royal Commission in 1857, resulting, in October 1857, in the appointment of the Barrack and Hospital Improvement Commission to go into the matter in detail as regards the United Kingdom and the Mediterranean stations. The reports of this commission, presented in 1863, besides containing valuable recommendations for the improvement

of almost every barrack inspected by them, laid down the general sanitary principles applicable to the arrangement and construction of military barracks and hospitals, and in spite of the lapse of time they may be still regarded as text-books of sanitary science as applied to the construction and improvement of such buildings. The labours of many contributed to that result, but beyond all others should be remembered the names of Sidney Herbert (afterwards Lord Herbert of Lea), Captain (afterwards Sir Douglas) Galton, R.E., F.R.S., and John Sutherland, M.D. The Barrack and Hospital Improvement Committee was constituted as a standing body in 1862 to continue the work of the commission, changed its name to that of the Army Sanitary Committee in 1865, was reconstituted in 1890, and remains to this day the principal adviser of the Secretary of State for War on sanitary matters. In accordance with the recommendations of these bodies great changes have been made from time to time in those old barracks which were required for constant occupation, while under the same inspiration a high standard for new work was established by the erection of numerous regimental depots and other barracks under the Military Forces Localization Act of 1872. Later a further advance was made when the Barracks Act (1890) was passed, in order to deal with barracks generally, and especially to replace with permanent buildings the worn-out wooden huts at Aldershot, Colchester, Shorncliffe, and Curragh; and under the Military Works Acts of 1897, 1899, and 1901 still further improvements have been introduced. This raising of the standard of barrack accommodation is doubtless bound to continue; for in a country where a short-service army is kept up by a large annual number of voluntary enlistments, in order to encourage recruiting it is necessary to provide for the soldier such advantages as will compare favourably with what he might expect in civil life, and thus make up for the smaller pay and restricted liberty to which he will have to reconcile himself. Hence in dealing with this question there are three great objects to keep in view, viz., the training, the health, and the comfort of the soldier, while in addition financial considerations ordain due regard to economy.

A description of a modern barrack for a battalion of infantry will show how at present these objects are sought to be attained. The general locality for the barrack having been determined by military considerations, especially with regard to proper facilities for rifle practice, training and manoeuvring, the selection of a suitable site becomes a matter of the first importance.

In the United Kingdom an ideal site should be airy, open, and dry in itself, should slope gently towards the south, and be protected from cold winds by trees or rising ground. It should be free from local mists, and from smells from gas or chemical works, brickfields, sewage farms, etc. The levels and situation should be such as to afford ample falls for sewers and subsoil drains, and to prevent flooding or waterlogging by surface or subsoil water from adjacent areas. The surface soil should be light but fairly fertile, uncontaminated by sewage, heavy manuring, or previous occupation. The subsoil, if not rock, should be porous, such as gravel, or absorbent, such as chalk, and it is desirable that the level of the subsoil water should be low and fairly constant throughout the year. Clay, whether as surface or subsoil, should be avoided if possible, especially in the case of barracks for mounted troops, for which sand or gravel are the best soils, as being the least muddy. Finally, there should be a good and ample water supply, facilities for obtaining gas and electricity, means of disposing of sewage in a satisfactory manner, preferably into public sewers, and easy access by road and rail. It cannot be expected that any site would possess all these characteristics, which are not all of equal importance, while the absence of some of them can be remedied. For instance, trees can be planted to give shelter; insufficient drainage-fall can be made up for by pumping; flooding can be prevented by intercepting drains; contaminated surface soil can be purified by burning; and if there are no public sewers or natural sewage-outfalls available, no companies for the supply of water, gas or electricity, insufficient roads or railways, in that case sewage works can be established, wells can be sunk and pumping machinery erected, gas or electricity can be manufactured, roads and railways can be constructed; but the general airiness and salubrity of position, satisfactory subsoil, freedom from noxious and insanitary surroundings, and purity and sufficiency of water sources, are essentials, defects in which cannot be remedied by mere expenditure. These essentials generally indicate a country site, although the proximity of a small town is advantageous for supply, and for residences and lodgings for married officers and soldiers, and also for the sake of the sewers, water and lighting companies, and railway communication that would probably become available. The barrack, however, should not be too near the town, but should be isolated from it if necessary by the purchase of intervening land. The area required for the regimental buildings and parade of an infantry battalion is about 22 acres. A cavalry regiment, or a brigade division of horse or field artillery requires about 30 acres, and a company of garrison artillery, engineers, army

service corps, or army ordnance corps, 3 acres and upwards, according to the number of horses and waggons to be provided for. In addition to these areas, space is required for recreation ground and soldiers' gardens, and for garrison accessories, such as offices for the staff, garrison church, hospital and school establishments, engineer workshops and yard, stores of the army service corps and army ordnance corps, provost or military prisons, with the necessary quarters in each case, apart from any land required for rifle or gun practice, military training and manœuvring. The whole site, perhaps omitting the recreation ground and soldiers' gardens, may be enclosed by a wall or iron railings, although such enclosure is often omitted in the open country, or where there are a number of barracks together, as at Aldershot. Taking the case of an infantry barrack for a single battalion, on a site of about 22 acres, a suitable portion, about 450 feet by 300 feet, is set apart for a parade for forming-up purposes, it being assumed that, as is generally the case, ground is available near at hand for battalion or brigade drill. Round the parade are arranged the several buildings, the men's barracks with their immediate accessories and the canteen being probably on the upper side, the officers' quarters on the opposite side or at one end of the parade, the guard-room, regimental offices, stores and shops, sergeants' mess and recreation establishment, at the other end, the drill shed facing the parade, where convenient, and the married soldiers' quarters either behind the single men's barracks, or in one corner of the site near but not overlooked by them. If garrison accessories are to be provided for, the site would be larger, and they would probably be disposed sympathetically, as it were, *i.e.*, with staff officers' quarters near the officers' quarters, garrison offices, stores and shops near the regimental ones, schools convenient for access both for men and children, church and gymnasium facing the parade, married men's quarters with those for the battalion, the hospital establishment, with quarters, in as isolated and airy a position as the site affords, and any prison buildings in an inconspicuous corner.

Such would be a fairly typical arrangement of the buildings of an infantry barrack; and it would be somewhat similar in other cases, except that with mounted troops the foot parade might be smaller, in which case there might be a stable square or mounted parade, probably behind or flanking the men's barracks, the stables being on the side nearest the men, with forage stores, forges, shops, riding school, waggon or gun sheds round or abutting on the square, infirmaries stables isolated but not far from a forge, and exercising ground and manèges farther in rear, the latter, however, near the riding school. In all cases the general of the district obtains the opinions of an engineer officer, of a medical officer, of the officer in charge of the barracks, and of an officer of the branch of the service for which the building is intended, and he forwards these opinions with his own to the War Office for approval. In the more important cases additional opinions and local information as to climatology are obtained, the site is explored by excavation and boring, and the water sources are tested. Frequently the site is also inspected by officers of the headquarters staff, in order that they may have personal local knowledge to assist them in dealing with the proposals put before them, which are then submitted to the Army Sanitary Committee, who in all important cases inspect and consider them on the spot. Finally, on the buildings, when completed, the general calls for reports as in the case of sites, and they are only taken into occupation if they satisfy the officers consulted.

Scales of floor-space and air-space have been laid down for men in their barrack rooms, in hospital, in school and lecture rooms, in chapel and in confinement, the more important of these scales embracing all climates. The provision of proper arrangements for ventilation is assumed, and the initial point, so to speak, is an allowance of 57 feet of floor-space and 600 cubic feet of air-space per man in a permanent barrack room in England, the allowance for ordinary hospital patients being one and a half that amount of floor-space and twice that amount of air-space. With these scales as a guide it is easy to ensure sufficient spaciousness in all other rooms. To secure dryness of site subsoil drainage is resorted to when necessary, and is always provided for unmetalled surfaces used by horses, such as exercising grounds and manèges. Parades, roads and paths are paved, metalled, or gravelled, according to use, and are provided with surface channels and storm-water drains. Surfaces not exposed to much traffic are laid down in grass, as being generally less costly than gravel, less dusty, and more easily kept in order by the troops. To secure dryness of buildings asphalt damp-courses are provided, and the area of each building is covered with an impervious coating of cement-concrete or paving, to prevent ground-air and damp from rising and to keep out vermin. Hollow external walls were generally adopted for the sake of warmth and dryness during the last 30 years of the 19th century, and are still used in exposed positions. When well built these are quite satisfactory for buildings not exceeding two storeys in height, but their erection requires much care and supervision. The present tendency, therefore, is to have solid walls, which are unobjectionable for most buildings and situations, if of sufficient thickness to keep out damp. With a view to cleanliness, hollows

which might harbour dirt or vermin are avoided as far as possible. With this object, during the last decade of the 19th century, different kinds of water-proof and dirt-proof floors were used, so as to keep the space under them dry and clean. None of them were free from objections of one kind or another, and their use is abandoned for the present; but the sanitary importance of providing such floors is so great that it is to be hoped that renewed efforts will be made to devise a form suitable for barracks.

As for sanitation, the recognized principles of good drainage are adhered to, viz., that well-ventilated air-tight and water-tight pipe drains should be laid in straight lines and with even inclinations from point to point, where there should be manholes for inspection and cleansing, in which changes of direction and inclination and junctions with other drains should take place. No drains are allowed to run under buildings, and the sanitary apparatus therein is doubly cut off from the drains by water-trap and air-disconnexion, the drains themselves being disconnected from the sewers in the same way. The water-supply is to cisterns containing sufficient for two days at the rate of 20 gallons per head and per horse. Water is laid on for all necessary services, that for sanitary purposes being always drawn from separate cisterns. Only cast or wrought iron is, as a rule, used for supply or service pipes. The purity of the water, both as received and as delivered, is guarded by periodical testing and analysis. When pure water is scarce, there is sometimes a separate supply-system of inferior water for sanitary and fire purposes. With regard to the supply of pure air, the principle that holds the field is that of through-ventilation, partly by means of windows on opposite sides of every building and of almost every room, and partly by a system of inlet and outlet ventilation that cannot be completely closed. Half of the air admitted by inlets is brought directly to ventilating grates, which in cold weather warm it before passing it into the rooms. The clear sectional area of fresh air inlets is approximately equal to that of the outlet shafts, and is at the rate of 10 square inches per man in barrack rooms and 20 square inches per patient in hospital wards. With this as a guide it is easy to judge what special ventilation should be provided in other rooms, according to their use and occupation, bearing in mind that no room that is slept in should be without a fresh air inlet and a chimney flue or extracting shaft. As for light, the allowance in open positions is 1 square foot of glass to 100 cubic feet of air-space, but this proportion is exceeded in dark situations, in rooms that are thronged at times, such as recreation- and tap-rooms, and also in lavatories and bath-rooms, kitchens and sculleries, which cannot be made too light. For the sake of both light and air, buildings facing each other are placed at least as far apart as twice the height from ground floor to eaves, and the ends of the spaces or lanes between them are kept open. With regard to sunshine, officers' quarters are planned so that no rooms intended for habitation should face north, while all other blocks of inhabited buildings, especially the ward-blocks of hospitals, are arranged to run approximately north and south, so that the majority of windows may face east and west and receive sunshine at some time during the day. As also bearing on the question of health it should be mentioned that, except a few attic bedrooms in one type of married quarters, no rooms are less than 9 feet high, the great majority being from 9 feet 6 inches to 11 feet 6 inches high.

The amenity of a barrack is secured partly by planting trees, especially round the parade and recreation ground, and by providing a certain amount of shrubbery and grass-plot in connexion with such buildings as the officers' quarters and mess, sergeants' mess, recreation establishment, hospitals, &c.; and partly by such attention to architecture as is fairly consistent with economy, the result aimed at being to avoid a sordid or repellent appearance, and to emphasize the different buildings according to their occupation and importance. In some conspicuous situations, such as facing Southsea Common, and on some historic sites, such as the Tower of London and Edinburgh Castle, the attention paid to architecture has rightly far exceeded this limit. Soundness of construction is a matter of course, for barracks are built to last and not to sell. The only points worth mentioning, besides those already noticed, are that stairs are almost always of stone or iron, and that, in order to keep down repairs, few buildings have plastered walls except those used by officers and warrant officers, school-rooms, and hospitals. Barracks are generally lighted by gas, both internally and externally, or by mineral oil when gas is not available. At some stations, however, electric light is being introduced, especially for hospitals, and it is doubtless the light of the future. For habitation, buildings of two storeys are preferred to those of one storey, as being warmer and more convenient, while they occupy somewhat less space, and are a little less costly, taking all things into consideration. It is only on restricted sites that buildings of more than two storeys are adopted.

For the lieutenant-colonel commanding there is provided a house, generally detached, of ten rooms of moderate size, besides offices. Majors get two good-sized rooms and a servant's room;

captains and subalterns get half that amount, a portion of the officer's room, with a window in it, being often partitioned off for sleeping in. The quartermaster gets a seven-roomed house with small rooms, and the riding-master gets similar accommodation. Special quarters for married officers are also in future to be occasionally provided. The officers' mess contains a mess-room, ante-room, and billiard-room, with the necessary offices, and the block of officers' quarters and mess is so designed that the officers can reach the mess under cover. For general, staff, and departmental officers, quarters are provided as may be required, generally in detached houses, and varying in size according to the probable rank of the occupant, from the house for the general, with twenty rooms besides offices, to the six- or seven-roomed cottage of the married aide-de-camp or staff captain. Warrant officers get quarters consisting of a living-room, kitchen, scullery, and three bedrooms. Married sergeants and rank and file, numbering about fifty in the case of an infantry battalion, get quarters consisting of a living-room, small kitchen or scullery, and one, two, or three bedrooms, according to the number of children. There have been several types of married soldiers' quarters, each an improvement on the last. In the latest type each quarter is self-contained and opens off a verandah, each family having its own water-closet, reached by a ventilated lobby from the quarter itself. Near the quarters is a good laundry with washing-room, heated drying-closet, ironing-room, and drying-ground. The proportion of quarters of each size is arrived at from statistics as to 10,000 soldiers' families, and, though based solely on the number of children, it varies according to rank, and even according to the character of the barrack. For sergeants are, on the whole, men of longer service than the rank and file, and therefore have larger families, and the married sergeants and rank and file at depots have, as a rule, more years' service than those at headquarters. The proportion of quarters with one bedroom ranges from 52 to 68 per cent.; with two bedrooms, from 35 to 27 per cent.; with three bedrooms, from 5 to 13 per cent. Out of the 10,000 families referred to, no less than about 24 per cent. had no children, about 20 per cent. had only one child, about 19 per cent. had two children, about 14 per cent. had three children, under 10 per cent. had four children, and only about 13 or 14 per cent. had more than four children living with the parents, *i.e.*, under 14 years of age if boys, and under 16 years if girls.

For the single non-commissioned officers and men of each half-battalion, according to the latest designs, two parallel two-storeyed blocks are built facing each other, and about 200 feet apart, with verandahs on both floors, and each containing two companies. Midway between these blocks is the cook-house for the half-battalion, and attached to it is a bath-house and four company drying-rooms for wet clothes. Close to the cook-house, and between it and each barrack block, are company dining-rooms, with wash-up sculleries. These five blocks of buildings are connected by verandahs, so that from any barrack-room a man can go under cover to any room in that block, to his dining-room and drying-room, to the bath-house and kitchen. The barracks for a half-battalion occupy a square plot, and can therefore be turned to face in the direction that may best suit the site. The barrack blocks contain for each company two sergeants' rooms, two store-rooms, eight men's rooms 80 feet by 23 feet 6 inches, each for twelve men, and four ablution-rooms. Thus not only each company, but each section or quarter-company, has its own separate accommodation. The barrack-rooms, 10 feet 6 inches in height, afford 57 square feet of floor-space and 600 cubic feet of air-space per man. They have windows on opposite sides of the rooms, so as to give through-ventilation, and the beds are arranged with their heads to an external wall, seldom less than 18 inches apart, and generally in pairs, with a window and an inlet ventilator to each pair. An arm-rack and shelves for each man's arms, kit, and belongings are fixed at the head of each bedstead, which can be shortened to half its length in the daytime, when it serves as a seat. Each man has a box with a lock beside his bed, and tables and forms are provided as required. In the ablution-rooms water is laid on and basins provided at the rate of one to six men. In the cook-house is apparatus for all ordinary modes of cooking, except roasting before an open fire. The bath-house, with one bath for the sergeants and four for the men of the half-battalion, has hot and cold water laid on, as also have the wash-up sculleries, and the drying- and dining-rooms are heated with hot water. Water-latrines and urinals are provided, with all due regard to decency, in convenient positions not far from the barrack blocks, at the rate of 5 per cent. on the accommodation for single sergeants and men, those for sergeants being kept separate. When water-drainage is not available, the earth-closet system is adopted.

Such is the approved design at the commencement of the 20th century. Up to that time each company had a separate block, and there were no dining-rooms with sculleries, no drying-rooms, and no covered communication with the kitchen, while hot water

laid on to baths was only allowed at stations where many recruits were received. Such barracks were good in essentials, but the new type gives much greater comfort. Any further advance in barrack-room construction is likely to be in the direction of providing separate cubicles for each man, a system which, some hope, will improve recruiting in consequence of the greater privacy afforded; against which advantage, however, must be set disadvantages of a hygienic, disciplinary, and social character.

The guard-house, situated at the main entrance to the barrack, contains a guard-room, with a prisoners' room opening off it, and four cells. A small-arm ammunition store, fire-engine house and ladder-shed, form part of the same block, or are near it. Close to the guard-room are the regimental offices, embracing the commanding officer's office, or orderly-room, the clerk's office, and an officers' waiting-room. Here also is the telegraph- or telephone-room, when such is required. A medical-inspection-room, with waiting-room, is also provided if the hospital is too far off for the sick to be marched thither for examination. The drill-shed, facing the parade ground, and 150 feet long by 30 feet wide, is usually open on one side and floored with gravel. When there is no gymnasium it is closed on the fourth side, has a wood-block floor and a little gymnastic apparatus, and is lighted with gas. The shooting-gallery is sometimes combined with the drill-shed. The sergeants' mess, in a pleasant situation not too close to the canteen or men's barracks, but convenient for access both for single and married sergeants, contains a mess-room, about 40 feet by 24 feet, and the necessary adjuncts and offices, including a jug-department with separate entrance for sergeants' families.

The regimental institute consists of two parts, the canteen and the recreation establishment. The former contains a bar, a tap-room, about 48 feet by 25 feet, with a stage at one end for music and entertainments, and a room for corporals, with a separate entrance. There is also a separate jug-department for soldiers' wives, the necessary cellars and accessories, and a quarter for the manager. The recreation establishment, in a cheerful position and quite separate from the canteen, though often near it, contains a recreation- or games-room, a reading-room with library, a coffee-room and coffee-bar, kitchen and offices, a grocery shop and store, with separate entrance, and quarters for the manager. The public-rooms have an area of about 2500 square feet, and are about 15 feet high. Attached to the building, and capable of being used for recreation when required, is a lecture-room for the instruction of companies by their officers. Additional means of recreation are provided in the shape of a five-court, a shooting-gallery, and, when land is available, a cricket-ground and soldiers' gardens.

The regimental stores and shops include an office for the quartermaster, stores for bread and meat, clothing, general purposes, coal, musketry, and pioneers, and for oil, if the barrack is not lighted by gas or electricity. The shops are for tailors, shoemakers, armourers, carpenters, plumbers, painters and glaziers. Transport stables for six horses, with harness-room and forage store, and sheds with gates for the waggons and carts used in peace time, for mobilization vehicles and for two machine guns, complete the purely regimental buildings. In addition, there are the garrison accessories, arranged to serve all the barracks at an ordinary station, or groups of barracks at such a station as Aldershot.

The army service corps buildings may comprise only the ordinary stores for bedding, utensils, unserviceable stores, &c., and for forage for any mounted troops, or they may include a bakery with flour and bread stores, an abattoir with cattle byres and meat stores, and reserve provision stores, according to the circumstances of the station. A chapel is seldom built for a single barrack if arrangements can be made for divine services for the troops at neighbouring places of worship. Gymnasias vary in size from 80 feet by 40 feet to 150 feet by 50 feet, according to the force they have to serve. Military prisons for the longer sentences are few in number, and provost prisons for the shorter sentences are less necessary than used to be the case. They are both constructed in accordance with the regulations of the Prison Department of the Home Office, modified as necessary to meet military requirements, and are certified as fit for occupation by the inspector-general of military prisons.

For the engineers there are ordinarily stores for tools, &c., for field-works, and a building yard, with shops, stores, and offices, while sometimes pumping establishments and sewage, gas, electric, and railway works have also to be provided.

Schools are of two kinds, one for men and for children over seven years of age, under masters, and the other for the younger children, under mistresses. They are built in accordance with the principles and regulations of the Committee of Council for Education, modified slightly to suit military requirements. School seats in the adult and elder children's school are provided according to a sliding scale which works out at 10½ per cent. for a battalion, but gives a somewhat higher percentage for smaller bodies of troops and a lower percentage for larger bodies. In infant schools

Miscellaneous buildings.

the provision of seats is at the rate of about one per family on the married establishment, with a similar variation in the case of large and small numbers.

Hospitals are fenced off from the rest of the barrack buildings, and are constructed in accordance with the approved principles of modern hospital construction, avoiding, however, the extravagance with which they are often applied. As there are no facilities for treating in their quarters men who are slightly ill, many patients are admitted to military hospitals who, in civil life, would be out-patients, or would be treated in their own homes. The number of beds provided is at the rate of 5½ per cent. on the strength of the garrison, exclusive of officers. In civil life the provision of hospital beds, at the rate of one per 1000 of population, is considered by some authorities to be fairly sufficient; and even if this proportion is multiplied fivefold, nothing more emphasizes the difference of character between civil and military hospitals than the contrast of such a number with the 58 beds per 1000 provided for the army. In the United Kingdom the allowance of floor-space and air-space for patients is as follows:—

	Floor-space.	Air-space.
For light cases .	65 square feet	900 cubic feet
For ordinary cases .	85 "	1200 "
For infectious cases .	110 "	1500 "

The construction adopted is the pavilion system. In a large hospital the light-case wards are for about 28 beds each, and the ordinary large wards are for 22 beds, one of them specially fitted up and warmed for pneumonia cases. There are smaller wards for cases under observation, for prisoners, lunatics, ophthalmia, itch, and serious cases requiring quiet and special nursing. General reading-rooms and dining-rooms are provided for patients able to avail themselves of them. There are the usual accessories of a hospital, namely, the administrative department, the stores, kitchens, quarters for medical staff and hospital orderlies, and for nursing sisters in the larger hospitals, in which also are provided an operating-room, lift for recumbent patients, and apparatus for disinfection and destruction, unless these processes can be carried out in existing local establishments. The isolation wards for infectious cases form a separate hospital as far as nursing goes, cut off from the rest by double fences with neutral space between, and there is no covered communication between the different wards or ward blocks, which are at least two, and often three, in number, so that the three prevalent diseases, scarlet fever, diphtheria, and typhoid, can be kept separate. At some large stations a separate isolation hospital is provided, with its own staff and administration, and divided into two portions, one for men and one for women and young children, if the latter cannot be provided for in local hospitals. Occasionally a hospital for women and children is also provided, with a general wing and a maternity wing.

The barracks for other branches of the army are very similar to those for infantry as far as officers and men are concerned, with the addition of stables and their accessories, sheds for waggons and guns, stores and shops, to meet their several requirements. In stables each horse is allowed at least 1500 cubic feet of air-space

Stables. and from 85 to 110 feet of floor-space. The stalls, 11 feet long by 5 feet 6 inches to 6 feet wide, are arranged against the outer walls, with windows over them. In addition to inlet ventilation at the eaves, fresh air is brought to each horse when lying down by ducts at a height of 15 inches above the floor. Windows and skylights are provided to give 9 square feet of glass-space per stall, and the windows are arranged on each side of the stable, and are all made to open, so as to give cross ventilation. Stables generally have open roofs with roof ventilation, but if there are rooms over them they have concrete ceilings and large extracting shafts to carry off vitiated air. Paving is generally of cement concrete, as being unabsorbent and free from joints. It is grooved to prevent slipping as far as possible, the grooves being arranged to run to surface channels and to be easily swept out. Infirmary stables are similar but larger, giving 1800 cubic feet per horse; but half the infirmary accommodation of 6 per cent. on the total number of horses is in the shape of loose boxes, some of them fitted with slings, and giving at least 2000 cubic feet per horse. Two of these boxes are in a separate building for isolation purposes.

For a cavalry regiment a riding-school 150 feet by 53 feet 6 inches, 8 open manèges each 180 feet by 60 feet, and courses for jumping and "heads and posts" exercise, about 1100 or 1200 feet long by 150 feet wide, are also provided, as well as shops for saddlers and saddle-tree makers, and a four-fire forge with a couple of enclosed shoeing sheds. Each horse and field artillery battery, besides its barrack and stable accommodation, has its own battery office, store, shops for collar-makers and wheelers, forge, harness rooms, gun-shed and manège; while all other accessories are for joint use, on a scale proportionate to the number of batteries stationed together; and a system similar in principle prevails in barracks for garrison artillery, engineers, army service corps, army ordnance corps, and army medical corps, in all which branches of

the service the troop or company is the administrative unit, instead of the battalion or regiment.

At foreign stations similar accommodation is provided for white troops, and the same general principles hold both for European and native troops, but the air-space and floor-space allowed, and the details of construction, vary greatly according to climate and locality. The main difference is that in tropical and sub-tropical countries provision is made for the freest possible circulation of air below the ground floors of inhabited buildings, which are raised at least 4 feet above cement concrete paving covering the site. All such buildings are provided with verandahs, generally on all four sides within the tropics, and on the sunny side, at any rate, at sub-tropical stations. These verandahs are commonly used for dining in, and as they take the place of passages, the internal arrangement of the buildings is, as a rule, simpler than at home. The space for Europeans allowed in barrack rooms varies from 60 square feet of floor-space and 630 cubic feet of air-space in Nova Scotia and a hill-station in Mauritius to 80 feet of floor-space and 1000 feet of air-space at the hottest or unhealthiest stations, such as Port Louis in Mauritius, Sierra Leone, Ceylon, Singapore, &c.; while in hospitals the allowance varies between 85 feet of floor-space with 1200 feet of air-space and 110 feet of floor-space with 1600 feet of air-space, or 150 feet of floor-space with 2100 feet of air-space for infectious cases. For native troops in all climates the normal 57 feet of floor-space and 600 feet of air-space in barracks is generally adhered to.

The aspect of buildings in hot climates is in most cases either north and south instead of east and west, or else such as to catch the prevailing winds. In some places it is necessary, especially in the case of hospitals, to fill the openings of the verandahs with movable louvres; and in some stations, such as Sierra Leone, where tornadoes are common, it is found advisable to enclose the verandahs to a considerable extent to prevent the rooms from being flooded by driven rain, or to provide hurricane shutters. The mode of construction varies greatly, according to the custom and resources of the country, both as regards labour and materials, the local construction being generally adopted, provided it gives sufficiently sound sanitary and vermin-proof buildings. For several stations, however, it has been found cheaper as well as better to send many of the materials from England, even including bricks. In hurricane countries, if wooden buildings are used, they should not be more than one storey in height. In earthquake countries one-storeyed wooden buildings with iron frames are the best, and they should have wooden ceilings instead of plaster. In white-ant countries as little wood should be used as possible, and that should be ant-proof.

Outside India British barracks have to satisfy the manifold needs of all the branches and establishments of an army of upwards of 200,000 men; or, in other words, they form a landed and house estate of the value of somewhere about 40 million pounds, scattered in many hundreds of localities all over the world, with all kinds of varieties of climate, position, and altitude, subject to many different systems of law and government, and adapted to meet the customs, prejudices, and religious requirements of many different races. (H. Lo.)

India.—The changes which have led up to the present status of barracks and military sanitation in India are directly traceable to the recommendations of the Royal Commission of 1859, and are primarily accountable for a net decrease in the annual army death-rate in India, since that date, of about 54 per mille, *i.e.*, from 69 to 15 per mille. In the upkeep of the necessary standard plans and regulations, whether for British or native troops, in hills or plains, the Government of India is guided by the Royal Engineers and medical services. Further assistance in these matters is given by special sanitary commissioners, who report annually on the health of the troops, and incidentally on the military works carried out in each Presidency, and by the Army Sanitary Committee at home; Parliament being kept informed of all Indian sanitary measures in a consolidated report framed every year by the India Office. Present practice, so far as it differs materially from that of the United Kingdom, is briefly described below.

The common difficulty of obtaining sufficient gradients or suitable outfall for ordinary pipe drainage has resulted, except in rare cases, in the adoption of the primitive methods of conservancy known as the "removal" and "trench" systems. In the former, which is common to private quarters and dwelling-houses as well as to public latrines, the foul matter is removed by a native "sweeper" in constant attendance, and transported nightly to

isolated plots of ground, where it is lightly buried in a series of shallow trenches. In the "trench" system, which is commonly used by natives and in camp, the latrines themselves are on the disposal ground, and consist of light screens which are daily shifted over the trenches, the ground in either system being subsequently cultivated. Incineration is also sometimes used. Waste water from cook-houses and baths is carried in channels to, or poured from receptacles over, patches of grass or neighbouring gardens. Although readily open to inspection, and well suited to a country where space is often unlimited, these operations require the most rigid regimental supervision; and the necessary precautions to this end, together with the proper sanitary policing of all native lines and bazars, are among the most important safeguards of the health of the army in India.

While pipe systems for water supply are now being generally introduced, the older method of direct carriage from wells or reservoirs by hand, bullock, or cart is still practised. Special care is taken to ensure a pure as well as a plentiful supply in the immediate neighbourhood of every barrack.

Sites for barrack and hospital buildings, being more extensive, allow greater dispersion and consequently freer circulation of air among buildings than is either necessary or possible at home; parade and cricket grounds and soldiers' gardens are easily provided, and tree planting is general. For British troops double-storeyed barrack blocks, with sleeping rooms above and day-rooms and other regimental accessories below, were very generally introduced after 1859. Single-storeyed barracks, while more convenient, are, however, found to be equally sanitary if sufficiently raised from the ground, and are now the ruling type. Each standard block (for half-company, half-troop, etc.) consists of two dormitories 20 feet high, giving 90 square feet and 1800 cubic feet per man (this allowance was frequently given before 1859), with central mess-room affording 30 square feet per man, and a sergeants' quarter of two rooms and bath-room at either end. A store for each barrack room is provided in the verandahs, which are 12 feet in width. Detached lavatories, which are provided at the rate of one to each two barrack blocks, contain fixed basins at 20 per cent. and private ablution-rooms at 8 per cent., water being laid on from outside cisterns. A large plunge-bath is also generally supplied to every half-battalion. Cook-houses are arranged in blocks for 2 companies, and have each 2 kitchens, 2 cooking places, and 2 cooks' rooms. Native cooks are still generally employed, and the apparatus is of the simplest.

Married quarters are of six classes, three for sergeants, varying with rank, and three for men, varying with size of families, as follows:—*Sergeants' quarters*.—Class A, 1 sitting- and 2 bed-rooms; class B, 1 sitting- and 1 bed-room; class C, do. (smaller). *Men's quarters*.—Class 3, 1 sitting- and 1 bed-room; class 2, do. (smaller); class 1, 1 bed-sitting-room. There is a bath-room in the verandah in all cases. Although the married establishments in India are liberal—viz., 100 per cent. for sergeants and 4 per cent. for rank and file—it is found in practice that these figures are never worked up to; and the percentage of married quarters actually provided is as follows for the different arms:—

	Infantry. Per cent.	Cavalry. Per cent.	Artillery. Per cent.
Sergeants	36	40	56
Rank and file	1-25	3	4

Warrant officers' quarters consist of 1 large sitting-, 2 bed- and 2 bath-rooms, besides cook-house and outside latrine.

The institute contains a liquor bar (now invariably in a separate building), a library, and a recreation and refreshment portion, corresponding to the English canteen and recreation establishments, but on a slightly more lavish scale. The remaining accessories are also more liberal, notably in the case of the voluntary shops, which include tinsmith's, printing, painting, bookbinding, and watchmaking shops. Furniture stores in charge of the royal engineers, who make the furniture, are an extra; whilst laundries are never found except in hospitals, owing to the general adoption of the native outdoor system of washing.

Stables for mounted branches consist of long double rows of stalls 14 feet by 7 feet, in which the horses are picketed, facing inwards to a central passage; the construction is light, and mangers are dispensed with. The floors are normally of earth, periodically renewed, or of more permanent material if readily available. Open terraces for use of horses in temperate weather are often built regimentally. Separate harness-rooms, stores, and night picquet guard-rooms are invariably provided. Infirmary stables generally include a casting shed. Closed riding-schools are unusual, and the open manèges are fewer than in the United Kingdom. All mounted corps are allowed dummy waggons and trucks for practice in entraining horses and guns.

Besides the usual station buildings, a reading-room for religious literature is invariably provided. School accommodation is at the rate of 120 adults and 64 children per battalion, as compared with 84 and 60 at home. Lines or huts for native followers are a necessary

adjunct of every barrack. Transport lines or standings for pack animals are also necessary where the latter are kept regimentally.

In hill stations or convalescent depots the scale of accommodation is somewhat reduced, the individual allowance being 60 square feet and 600 cubic feet. The type buildings are light permanent huts designed in bays, capable of being combined in any numbers, with or without verandahs, closed or open.

Native barracks are, except in special cases, built by the sepoys with materials provided by themselves, as in the cavalry, or as in the infantry, out of a hutting allowance granted by Government, the buildings, when completed, becoming in the former case the property of the men, and in the latter that of Government. The forms of construction are, owing to the native mode of life, essentially simple, and vary slightly in different parts of the country. Quarters for married non-commissioned officers and men consist of lines of huts 12 feet to 14 feet high, slightly raised off the ground, and divided into separate single rooms, about 12 feet by 10 feet, with verandahs, bath-rooms, and court-yards, whereby privacy and individual responsibility for cleanliness and protection of property are ensured. For unmarried men, continuous huts or "pendals," with non-commissioned officers' rooms, are provided, giving a minimum of 60 square feet and 810 cubic feet per man in the plains, and 45 square feet and 400 cubic feet in the hills. In some cases two single men are allotted to a married man's quarter. Native officers have separate establishments similar to the married men's quarters, but with a varying number of rooms and proportion of servants' huts and outhouses, according to rank. The remaining accessories of a native barrack, which are provided and built by Government, are on the same simple scale, no permanent latrines, cook-houses for married men, ablution-rooms, mess- or recreation-rooms being required, and no furniture, &c., being provided.

Native cavalry have open standings for their horses (which are their own property) adjoining their quarters, and sheds for camels and saddle-rooms are provided. In the native mountain artillery stables are generally built for the mules.

Quarters and messes for European officers are occasionally provided by Government at reasonable rents, according to rank; but more often officers make their own arrangements for hiring, their pay being intended, except in special cases, to cover either contingency. Where neither of these courses is possible Government occasionally advances the necessary money for building at a moderate rate of interest.

Hospitals for British troops are allotted on the station system. The typical ward block consists of a single-storeyed building in the style of a half-company barrack, and containing, besides the necessary wards, one attendants' and one day-room, with bath-rooms, &c., at the ends. The beds, reckoned at 10 to 12 per cent. of garrison, are allowed 120 square feet and 2400 cubic feet in ordinary wards, and 150 square feet and 3000 cubic feet in separate isolation blocks. These latter, in common with officers' wards, are provided at special stations only. A women's and children's ward, with a matron's quarter to every ten beds, is usually an adjunct of every hospital, the beds being calculated at 8 per cent. of the men in garrison. Wards for followers, for severe cases or accidents, at fixed proportions for different units, are built and kept up by the departments concerned. The remaining hospital buildings comprise quarters for lady nurses and medical subordinates, with outhouses and stables; lines for hospital servants, an administration block, with stores, cow-shed, ambulance-shed, lamp-room, guard-room, mortuary, disinfectant and latrines, ablution-rooms and laundry. In the hills provisions are similar, but somewhat curtailed, the allowance per bed being 102 square feet.

In the case of native troops, although the station hospital system is approved for new barracks, the existing hospitals are chiefly regimental. The main building, which follows generally the lines of the ward block for British troops, includes the wards, giving 60 square feet and 810 cubic feet per bed, as well as the administration offices, stores, and bath-rooms. The cookhouses, latrines, washing-well, mortuary, and quarters are provided separately. Hut wards for contagious diseases, giving 110 square feet and 1800 cubic feet per man, are also provided when required.

Although the standard types for barracks and hospitals are essentially adhered to, climatic conditions and local resources govern the materials used to a certain extent. Periodical repairs are more frequent than in the United Kingdom. Walls are usually of burnt brick, built hollow, or of solid sun-dried bricks or stone. Raised plinths are commonly filled in, but are sometimes arched. Roofs are either flat, or single- or double-tiled, or occasionally of corrugated or plain sheet iron at hill stations—thatched roofs nowadays being forbidden, except in the case of unimportant outhouses, on account of the danger from fire. Verandahs, which are a necessary accompaniment of every inhabited building, may be double or single, clerestory windows being usually provided above them. Fireplaces are provided where required, designed without projections, so that they can be filled in and the wall space utilized if necessary. Fuel, when required, is issued according to a fixed scale. Cooling devices in the plains

consist of punkahs pulled in series, or of tatties or fibre hurdles in the doorways kept continually wet, or of therm-antidotes by which air is artificially forced through wet fibre into the rooms. Where electric or other mechanical power is not available for working these appliances, a special staff is hired for this purpose. Except at very large stations where gas is specially made, the lighting of barracks is almost universally by oil lamps, the standard pattern lamp being considered sufficient to light 200 square feet of floor, and each British soldier in barracks being allowed 45 square feet of such illuminated area. For other military buildings lighted by Government the number of lamps is regulated by a fixed scale. Barracks for native troops are not lighted by Government.

(E. H. H.)

AUTHORITIES.—*The Army Book for the British Empire*. London, 1893.—F. RICHTER. "Gebäude für Militär. Zwecke" (in *Handbuch der Architektur*). Darmst., 1887.—BROCKHAUS. *Konversations-Lexicon*, 14th ed. 1895.—MEYER'S *Konversations-Lexicon*, 5th ed. 1898.

Barrafranca, a town of Sicily, in the Italian province of Caltanissetta, 11 miles S.E. from Caltanissetta. It has sulphur mines, olive-oil mills, and sulphur springs. Population (1881), 9052; (1891), about 10,000.

Barranquilla, the capital of a province of the same name in the department of Bolivar, Colombia, South America, and the great commercial centre of the republic, situated on a slightly sloping plain on the left bank of the Magdalena river, about 7 miles from its mouth, and about 85 miles N.E. of Cartagena. The river below the town being dangerous for large steamers, it is connected with the ocean by a railway running to Puerto Colombo (Sabanilla), where there is a steel pier 4000 feet in length, permitting the approach of vessels drawing 26 feet of water, and affording accommodation for five large ocean steamers. Situated at the initial point of the navigation of the Magdalena river, on which there is an excellent service of steamboats to Honda 592½ miles distant, Barranquilla, now more than rivals Cartagena as a commercial centre. Originally founded in 1629, it is only within recent years that it has risen into importance. It is regularly laid out, and the better-class houses are surrounded by beautiful gardens, while the business portion contains many fine warehouses. A few of the houses are constructed of wood, those of the better classes being built of brick with tile roofs, and those of the poorer classes of clay supported by a framework of split guadua cane, the roofs being thatched with rushes. There are three Roman Catholic churches and a Protestant mission, the other principal public buildings being the market, the hospital, and the theatre. The city is supplied with water from the Magdalena river, and possesses a telephone system, and a street railway with cars drawn by mules. There are large tanneries, shoe factories, hat factories, tin shops, soap and candle works, brick and tile works, match works, furniture works and rum distilleries. The population now approaches 50,000.

(T. F. H.)

Barre, a city of Washington county, Vermont, U.S.A., north of the centre of the state, a few miles south of Montpelier, the state capital, on branches of the Central Vermont and of the Montpelier and Wells River Railways. Formerly a village in Barre town, it has been separated from the latter and given a city charter. Population (1890), 4146; (1900), 8448.

Barrett, Lawrence (1831-1891), American actor, was born of Irish parents in Paterson, N.J., 4th April 1838. Beginning as a call-boy, he advanced steadily in his profession, gradually coming into prominence in leading parts. At the age of twenty he was acting with Charlotte Cushman and Edwin Booth. He served with distinction in the civil war as captain in a Massachusetts regiment. From 1867 to 1870 he managed the California theatre, San Francisco, together with John McCullough.

He rendered the drama of his country a special service by successfully producing new plays at a time when the American playwright was almost without recognition. He frequently supported Edwin Booth, who was a close personal friend, playing always with admirable intelligence and distinction. Among his many and varied parts may be mentioned Hamlet, Lear, Macbeth, Shylock, Richard III., Wolsey, Benedick, Richelieu, David Garrick, Hernani, Alfred Evelyn, Lanciotto; and his performance of *Richelieu* was one which attracted considerable attention when he appeared in London. He wrote a life of Edwin Forrest in the American Actors Series (Boston, 1881), and an admirable sketch of Edwin Booth in *Edwin Booth and His Contemporaries* (Boston, 1886). He died 20th March 1891.

Barrhead, a police burgh of Renfrewshire, Scotland, 8½ miles S.W. of Glasgow by rail. Iron and brass works, calico-printing, cotton-spinning, and the manufacture of sanitary appliances are all now important. A drainage scheme has been inaugurated. Population (1891), 8215; (1901), 9855.

Barrie, the capital of Simcoe county, Ontario, Canada, 53 miles N. of Toronto, on Lake Simcoe. It is an important railway centre on the Grand Trunk Railway, and has steamboat communication with various points on Lakes Simcoe and Conchiching. It contains railway shops, agricultural implement works, and saw and grist mills. Population (1881), 4804; (1899), 5980.

Barrow-in-Furness, a civil parish, municipal, county (1888), and parliamentary borough (1885), seaport and market town of Lancashire, England, including the isle of Walney; 87 miles N.N.W. of Manchester by rail. The corporation consists of a mayor, 8 aldermen, and 24 councillors. The cemetery, with three mortuary chapels, covers 55 acres. The educational institutions include a school of science and art, a girls' high school, a higher-grade board school, and a technical school (1901). The principal building is the new town hall, which is fronted by a statue of Lord Frederick Cavendish (assassinated in Dublin, 1882). The main reservoirs of the water supply, 90 acres in area, will hold 578,000,000 gallons. The Bessemer steel works now have only 9 blast furnaces in use, but the works of one firm of shipbuilders cover 82 acres, and the slipways allow of the building of 14 vessels at a time. There have come into importance a petroleum establishment holding over 22,500 tons of oil, and a paper-pulp factory employing about 450 hands. Sailing vessels at port in 1888 were 88 of 10,599 tons; steam vessels, 51 of 53,487 tons: in 1899—sailing vessels, 227 of 31,255 tons net reg.; steam vessels, 1162 of 444,957 tons net reg. Vessels entering port in 1888 were 2283 of 460,579 tons; clearances, 2296 of 452,202 tons; in 1899—entrances, 1389 of 476,212 tons net reg.; clearances, 1377 of 455,408 tons net reg. The imports of foreign and colonial produce for 1899 amounted to the value of £721,519 against £396,240 in 1888. Population of the civil parish, the municipal and county borough, and the parliamentary borough, which are all three co-extensive, covering an area of 21,009 acres (including 11,000 acres of sand and water) (1881), 47,259; (1891), 51,712; (1901), 57,589.

Barry, a town and seaport of England, on the Bristol Channel, opposite Barry Island, 8 miles S.W. of Cardiff, in the southern parliamentary division of Glamorganshire. In 1894 the parishes of Barry, Cadoxton, Merthyr Dovan, and part of St Andrews and of Sully, were constituted the urban sanitary district of Barry and Cadoxton. A village of no significance till 1888, Barry is now, in conjunction with Cadoxton, owing mainly to the docks, a

populous and important town. Besides the churches of St Nicholas (1876) and St Paul (1893) there are numerous dissenting places of worship. There are also three board schools, a county school, a seamen's institute, a free library, and a market, and two weekly newspapers. Area of urban

district, 3323 acres. Population (1891), 13,278; (1901), 27,028. Barry docks, the first of which was opened in 1889, lie about 8 miles S.W. of Cardiff, and 4 miles S.W. of Penarth. The following are the dimensions of the docks:—

Docks, &c.	Area.	Length.	Width.	Quayage.	Width of Entrance Gates.	Depth of Water on Sill.	
	Acres.	Feet.	Feet.	Feet.	Feet.	H.W.O.S.T.	H.W.O.N.T.

Barry Railway Company's graving dock can be divided into outer and inner docks of 384 and 359 feet respectively: depth on outer sill H.W.O.S.T., 26' 8"; H.W.O.N.T., 18' 4". Barry Graving Dock Company's graving dock can be divided into outer and inner docks of 354 feet each: average depth on sill, spring tides, 24' 8"; neap tides, 16' 4". No. 1 Dock and Basin are provided with 11 high- and 10 low-level fixed, 2 high- and 3 low-level movable, coal staiths; and 31 cranes, including 20 movable and 4 fixed hydraulic ballast cranes and one 50-ton crane. The total tonnage increased from 567,958 for half-year ending 1889, to 1,290,665 for half-year ending 1895. When the dock was opened in 1889 all the railway service was between Barry and Cogan. Now there is a through-service between Barry, Cardiff, and the Bute docks, between Barry and Perth in the Rhondda valley; and between Cardiff, Barry, and Bridgend. There are altogether about 29½ miles of railways of the Barry Railway Company connecting the dock with the various collieries and with the Taff Vale Company's lines at Penarth Dock. When completed, the Bute, Penarth, and Barry docks, all comprised within the Port of Cardiff, will have 14 miles of quayage, and about 200 miles of sidings.

Barry, Sir Redmond (1813-1880), British colonial judge, son of Maj.-Gen. H. G. Barry, of Ballyclough, county Cork, was born in 1813. He was educated at a military school in Kent, and at Trinity College, Dublin, where he graduated B.A. in 1833, and was called to the Irish bar in 1838. He emigrated to Australia, and after a short stay at Sydney went to Melbourne, with which city he was ever afterwards closely identified. After practising his profession for some years, he became commissioner of the court of requests, and after the creation in 1851 of the colony of Victoria, out of the Port Phillip district of New South Wales, was the first solicitor-general with a seat in the legislative and executive councils. Subsequently he held the offices of judge of the supreme court, acting chief-justice, and administrator of the Government. He represented Victoria at the London International Exhibition of 1862, and at the Philadelphia Exhibition of 1876. He was knighted in 1860 and was created K.C.M.G. in 1877. Sir Redmond Barry was the first person in Victoria to take an interest in higher education, and induced the local government to expend large sums of money upon that object. He was the founder of the University of Melbourne, of which he was the first chancellor, was

president of the Melbourne public library, national gallery and museum, and was one of the first to foster the volunteer movement in Australia. To his exertions is due the prosperity of the two institutions with which his memory is identified. The university was founded in 1854, and was thrown open to women in 1880. It has three affiliated colleges, Trinity (Anglican), Ormond (Presbyterian), Queen's (Wesleyan), and a conservatorium of music. The total number of graduates is 2066, about half being in arts, and the remainder in medicine, law, and science. The total number of persons attending lectures in 1898 was 668, and 147 took degrees. The teaching staff numbers 35, and about 1100 persons present themselves for matriculation every year, of whom about 500 pass, but a large proportion do not pursue their studies any farther. The total income of the university in 1898 was £30,110, of which £9000 was contributed by the Government. The Melbourne public library was opened 3rd July 1853, is free to every one, contains 480,000 volumes including pamphlets and periodicals, ranks as the tenth library in the British dominions, and is visited by about half a million of people every year. The national gallery of Victoria contained, in 1898, 434 oil paintings, 3451 statues and works of art. The total sum expended by the trustees has been £600,000. (G. C. L.)

Barsi, a town of British India, in the Sholapur district of Bombay, lying within a tract entirely surrounded by the Nizam's dominions. It is situated in 18° 13' N. lat. and 75° 44' E. long. Population about 20,000. Barsi is a flourishing centre of trade, exporting to Bombay large quantities of cotton and oilseeds. It has eight factories for ginning and pressing cotton—some on a large scale. It is connected with the main line of the Great Indian Peninsula Railway by a light railway of 22 miles, the property of a company, which will be extended 32 miles in another direction to Pandharpur.

Barth, a seaport town of Prussia, province Pomerania, on a coast lagoon, 19 miles by rail W. by N. from Stralsund. It has a mercantile fleet and a school of navigation, and carries on shipbuilding, sugar manufacture, the export of herrings, &c. Population (1895), 6223.

Barthélemy Saint-Hilaire, Jules (1805-1895), French scholar and statesman; was born at Paris. 19th August 1805. In his early days he was connected with the *National* newspaper, and in its office he formed

the intimate friendship with Thiers and Mignet which continued all his life. In 1833 he quitted politics for a time to devote himself to literature, and especially the study of ancient philosophy. Victor Cousin had won fame as the translator of Plato, Barthélemy Saint-Hilaire in like manner attached himself to Aristotle, and undertook a translation of his works. The first of thirty-five volumes appeared in 1837 and the last in 1892. This great work gained him the patronage of Cousin, a seat in the Academy, and the professorship of ancient philosophy at the College of France. During its progress he published a treatise on *The Logic of Aristotle*, 1839, and another on *The School of Alexandria*, 1845. The revolution of 1848 brought him back for a while to public life; he entered the Assembly, and was president of the commission on public instruction, but upon Louis Napoleon's *coup d'état* he again gave up concern in public affairs. Absorbing himself in Sanskrit studies he produced important works on the *Vedas*, 1854, and on *Buddhism*, 1858. In 1855 he travelled in Egypt, and in the following year published a book on the country, warmly vindicating his friend Lesseps's project, at that time much contested, for the construction of the Suez Canal. After the disasters of 1870 M. Barthélemy Saint-Hilaire reappeared in politics, exerted his utmost efforts to secure the election of Thiers as provisional President of the Republic, and upon this taking place became his secretary, and continued his most intimate confidant and counsellor until the statesman's death. In 1875 he was made perpetual senator, and he was Minister of Foreign Affairs in Jules Ferry's cabinet, from September 1880 to November 1881. The most important event of his administration was the annexation of Tunis under the form of a French protectorate, which he actively promoted. His latter years were chiefly employed in writing the life and publishing the correspondence of his former patron, Victor Cousin, who had bequeathed him a handsome fortune; he also commenced a new edition of Cousin's translation of Plato, which he did not live to complete. He died, labouring to the last, on 24th November 1895. Among his other works may be named *Mahomet et le Coran*, 1865, a translation of Marcus Aurelius, and a metrical version of the *Iliad*. (R. G.)

Bartlett, John (1820—), American publisher and compiler, was born in Plymouth, Massachusetts, on the 14th of June 1820. He became the university bookseller (and also a publisher) in Cambridge, Massachusetts, and from 1865 to 1889, when he retired, was a member of the bookselling and publishing firm of Little, Brown, and Co., in Boston. In 1855 he published the first edition of his dictionary of *Familiar Quotations*, long the best-known collection of the sort, and in 1894 (although it had been copyrighted five years before), after many years' labour, he published his *New and Complete Concordance or Verbal Index to Words, Phrases, and Passages in the Dramatic Works of Shakespeare; with a Supplementary Concordance to the Poems*—surpassing any of its predecessors in the number and fulness of its citations from the poet's writings.

Bartlett, John Russell (1805-1886), American historical and linguistic student, was born in Providence, Rhode Island, 23rd October 1805, and died there 28th May 1886. Several of his minor writings were devoted to matters connected with the earlier or later history of Rhode Island, of which he was secretary of state between 1855 and 1872; but his place in American scholarship is chiefly due to his *Dictionary of Americanisms*, of which the first edition appeared in 1850; a pioneer work which, although later dialect-changes have of course deprived it of completeness or final authoritative-

ness, was long of value to students of language, and remains the chief contribution to the subject.

Barwani, a native state of India, in the Bhopawar agency. It lies in the Satpura Mountains, south of the Narbada. Area, 1362 square miles; population, about 80,000; average density, 59 persons per square mile. Many of the inhabitants are Bhils. Revenue (1897-98), Rs.3,14,246; subsidy to Bhil corps, Rs.4000. The chief, whose title is Rana, is a Rajput of the Sesodia clan, connected with the Udaipur family. The forests are under an English official. The town of Bhawani is situated near the left bank of the Narbada. Population, about 5500.

Barye, Antoine Louis (1795-1859), one of the greatest sculptors of the French school, was born in Paris in 1795. Like many of the sculptors of the Renaissance he began life as a goldsmith. After studying under Bosio, the sculptor, and Gros, the painter, he was admitted to the École des Beaux Arts. But it was not till 1823, when he was working for Fauconnier, the goldsmith, that he discovered his real bent from watching the wild beasts in the Jardin des Plantes, making vigorous studies of them in pencil drawings worthy of Delacroix, and then modelling them in sculpture on a large or small scale. In 1830 he exhibited a "Tiger," and in 1832 had mastered a style of his own in the "Lion and Snake" (see Plate). Thenceforward Barye, though engaged in a perpetual struggle with want, exhibited year after year these studies of animals—admirable groups which reveal him as inspired by a spirit of true romance and a feeling for the beauty of the antique, as in "Theseus and the Minotaur," "Lapitha and Centaur," and numerous minor works now very highly valued. Barye was no less successful in sculpture on a small scale, and excelled in representing animals in their most familiar attitudes. As examples of his larger work we may mention the Lion of the Column of July, various Lions and Tigers in the Gardens of the Tuileries, and the four groups—War, Peace, Strength, and Order. The fame he deserved came too late to the sculptor. He was made professor at the museum in 1854, and was elected to the Academy of Fine Arts in 1868, only five years before his death. The mass of admirable work left to us by Barye entitles him to be regarded as the greatest artist of animal life of the French school, and as the creator of a new class of art which has attracted such men as Frémiet, Peter, Cain, and Gardet, who are regarded with justice as his worthiest followers.

See EMILE LAMÉ. *Les Sculpteurs d'Animaux: M. Barye*, Paris, 1856.—GUSTAVE PLANCHE. "M. Barye," *Revue des Deux Mondes*, July 1851.—THEOPHILE SILVESTRE. *Histoires des Artistes Vivants*, Paris, 1856.—ARSENE ALEXANDRE. *Les Artistes Célèbres: A. L. Barye*, Paris, 1889. (H. FR.)

Base-ball.—Base-ball, especially in the United States, has two distinct phases—one professional, and the other amateur. The sport itself has been traced back through various forms of trap ball, "one old cat," and rounders, to a comparatively early period. While England was developing cricket, America developed base-ball. The principal feature in the American pastime, as distinguished from cricket, is the limited time in which a game can be finished. One other vital point in which the two sports differ is that in base-ball if the ball is knocked in a certain direction it is called a foul, and the player who knocked it has not the privilege of making a run, but he may be caught out. This rule seems to a cricket lover a blunder in legislation, because if a player is not privileged to take advantage of the hit by making a run he ought not to be put to the risk of being caught out. Professional base-ball in the United States began soon after 1850; but the sport itself was not regarded then as a pro-

"LION AND SNAKE." By ANTOINE LOUIS BARYE.

fession. A man who played for a financial consideration always had some other means of a livelihood, as the income to be derived from playing ball in the summer time was not nearly enough to support him throughout the year. While the game grew for a time in popularity, it soon acquired certain adjuncts which were by no means desirable. The betting evil became prominent, as did also pool selling, and before long the game had little standing in respectable communities. It was not only generally supposed that the matches were not played on their merits, but it was known that players themselves were not above selling contests. At that time many of the journals of the day foretold the speedy downfall of the sport. A convention of those interested in the game, both financially and otherwise, was accordingly held in 1867 in Philadelphia, and an effort was made to effect a reformation. That the sport even then was by no means insignificant can be seen from the fact that in that convention some 500 organizations were represented. While the work done at the convention did not accomplish all that was expected, it did produce certain reforms, and the sport grew rapidly thereafter both in the eastern and in the middle western part of the United States. In the next five years the interest in the game became so great that it was decided to send a representation of American base-ball players to England; and two clubs, the Bostons, who were the champions that year, and the Athletics, former champions, went over and played several exhibition games with each other. While successful in exciting some interest, the trip did not succeed in popularizing base-ball in Great Britain. Fifteen years later two other Nines, representing American base-ball players, made a general tour of Australia and various other countries, completing their trip by a contest in England. This too, however, had little effect, and later attempts to establish base-ball in England have likewise been unsuccessful. But in America the game continued to prosper. In 1876 was formed the National League, of eight clubs, which contained the expert ball-players of the country. There were so many people in the United States who wanted to see professional base-ball that this organization proved too small to furnish the desired number of games, and hence in 1881 the American Association was formed. For a time it seemed that there would be room for both organizations; but there was considerable rivalry, and it was not until an agreement was made between the two organizations that they were able to work together in

harmony. They practically controlled professional base-ball for many years, although there were occasional attempts to overthrow their authority, the most notable being the formation of a Brotherhood of players, organized for the purpose of securing some of the financial benefits accruing to the managers, as well as for the purpose of abolishing black-listing and other supposed abuses. The Brotherhood proved not sufficiently strong for the task, and fell to pieces. For the last few years professional base-ball has been somewhat under a cloud, owing to questionable practices and rowdism on the field, as well as quarrels among the managers. Whether it will ever again be as popular as it once was is a question which time alone can determine. Careful legislation only can effect the desired end.

Amateur base-ball in America dates back to the time of the formation of the professional clubs, and the two have progressed along similar lines so far as rules and style of play are concerned. Frequently, however, the amateur rules, and especially the college rules, have differed from those of the professional in minor points. The history of college base-ball has been marked by the formation and dissolution of leagues and by individual championships between universities or colleges, and by some quarrels and disagreements, but never by anything like the unpleasant practices which have at times crept into the professional games. For this reason the sport has maintained its hold more strongly

DIAGRAM OF BASE-BALL FIELD.

during the last few years, and while the attendance at games by no means equals that at the younger sport of football, it has fully as constant a following and apparently an equally long lease of life.

Any comparatively level field over 100 yards square will serve for a base-ball ground. Upon this field is marked out a square, commonly called the "diamond," whose sides measure 30 yards each, and whose nearest corner is distant about 90 feet from one end of the field (see diagram). This corner is marked by a white plate a foot square, sunk level with the ground, and called the home base. At the other three corners are canvas bags 15 inches square, and called, beginning at the right as one looks into the field from the home plate, the first, second, and third bases respectively. The lines from home base to first, and from home base to third, indefinitely prolonged, are called the foul lines. The game is played by two sides of nine men each, one of these taking its turn at the bat while the other side is in the field endeavouring, as provided by certain rules, to

retire or put out the side at bat. Each side has nine turns at the bat. The arrangement of the men in the field, with the exception of pitcher and catcher, is in the form of two arcs, facing the home plate, whose radii are, roughly speaking, 30 and 60 yards. The arc with the lesser radius consists of four men called the in-fielders, and named the first, second, and third basemen and the short-stop. The last-named player stands midway between the second and third basemen. The other arc is composed of the out-fielders, and they are named, right, centre, and left fielders. Inside the diamond, and distant in a straight line in front of the home plate some 55 feet, is the pitcher's position, upon which he is obliged to stand when delivering the ball to the batsman. The catcher's position is not thus defined, but according as necessity requires he stands either close behind the batsman, or, when no runner is on the bases, and the batsman has not reached his last strike, some 70 feet behind the plate. When standing thus he simply performs the duty of returning the ball to the pitcher, as it is then unnecessary for him to catch it. The players of the side at the bat take their turn in regular rotation, and continue until three of them have been put out by the opponents. This retires that side to the field, and the other comes in to the bat. The batsman has a certain space marked off in which he must stand when striking at the ball. The batsman becomes a base-runner immediately he has made a "fair hit" (that is, knocked the ball so that it will fall in front of the foul lines), or when he has had "three strikes" (that is, three fair opportunities of hitting the ball), or, finally, when the pitcher has delivered "four balls," none of which have passed over the plate at the proper height, or have been struck at by the batsman. In this latter case he is entitled to occupy first base without being put out. In the other cases, *i.e.*, when he has made a fair hit or has had three strikes, he must start to make the round of the bases, which are to be taken in regular order (first, second, third, and home), and the first of which at least he must reach before he is temporarily safe from being put out. When he completes this circuit and crosses the plate without being put out, he scores a run; and the number of runs thus scored in nine innings decides the match. A batsman is put out if he hits the ball and the ball is caught by an opponent before touching the ground, or if he make three foul bunts (that is, attempts to block the ball with the bat). (By recent legislation a foul counts as a strike until a batsman has had two strikes.) A base-runner may be put out in any one of the following ways—if, having made a fair hit, the ball be caught by an opponent before touching the ground, or, having touched the ground, be held by a fielder any part of whose person is touching the first base, before the runner reaches the base; if, after three strikes, the ball be caught before it touches the ground, or, having touched the ground, be held at first base as above described; and, finally, if he be touched by the ball in the hands of a fielder at any time during his circuit of the bases when he is not touching the base which he is legally entitled to occupy. To provide for the satisfactory conduct of the game an umpire is agreed upon by the contesting Nines, and it is his duty to see that all the provisions of the rules are observed. He is also the judge of good and bad balls, put-outs, and runs. Any other point liable to become a point of dispute comes under his jurisdiction. Sometimes two umpires act at the same time, one at the plate and the other at the bases. (W. CA.)

Basel, or BÄLE (Basle is a wholly erroneous form), one of the Swiss cantons, which since 1833 has been divided into two half cantons—Basel-Stadt (urban Basel)

—which besides the town includes three country districts—and Basel Landschaft (rural Basel). The total area of *Basel Stadt* is 13·8 square miles, of which 11·7 square miles are reckoned as "productive." Of this 1½ square miles are covered by woods, and 0·19 square miles by vineyards. The statistics of this half canton are as follows:—*Population*.—(1880) 64,207, (1900) 112,246. In 1900 there were 8133 inhabitants to each square mile, the highest rate of density in Switzerland. *Religious*.—Protestants, (1880) 44,236, (1888) 50,081, (1900) 73,126; Romanists, (1880) 19,288, (1888) 22,132, (1900) 36,987; Jews, (1880) 830, (1888) 1086, (1900) 1903. *Linguistic*.—German-speaking, (1880) 62,644, (1888) 71,113, (1900) 107,205; French-speaking, (1880) 1901, (1888) 2040, (1900) 2741; Italian-speaking, (1880) 338, (1888) 346, (1900) 2361. The capital of this half canton is Basel. The cantonal constitution dates from 1889. The executive of seven members and the legislature of 130 members are elected by a popular vote, each for three years. Since 1875 the "obligatory referendum" obtains for all laws, while 1000 citizens can exercise the right of "initiative" in legislative matters, or demand the revision of the cantonal constitution. In 1897 the state revenue was 9,359,412 frs. (a rise of 101 per cent. since 1885), and the state expenditure 9,352,414 frs. (a rise of 99 per cent. since 1885), while in 1898 the surplus was 461,519 frs.; but in 1900 there was a deficit of 1,190,631 frs. In 1897 the public debt was 30,050,800 frs.

The total area of *Basel Landschaft* is 163·8 square miles, of which 158·8 square miles are classed as "productive." Of this 55·9 square miles are covered by forests and 1·7 square miles by vineyards. The statistics of this half canton are as follows:—*Population*.—(1880) 59,171, (1900) 68,451. In 1900 there were 411 inhabitants to each square mile. *Religious*.—Protestants, (1880) 46,670, (1888) 48,698, (1900) 52,617; Romanists, (1880) 12,109, (1888) 12,921, (1900) 15,775; Jews, (1880) 223, (1888) 165, (1900) 135. *Linguistic*.—German-speaking, (1880) 58,961, (1888) 61,507, (1900) 66,581; French-speaking, (1880) 217, (1888) 303, (1900) 598; Italian-speaking (1880) 72, (1888) 115, (1900) 1470. (Earlier figures are untrustworthy.) The capital of Basel Landschaft is Liestal. The cantonal constitution dates from 1892. The executive of five members and the legislature (one member per 800 inhabitants or fraction over 400) are elected by a popular vote. The "obligatory referendum" obtains in the case of all laws, while 1500 citizens have the right of "initiative" whether in legislative matters or in demanding the revision of the cantonal constitution. In 1897 the state revenue was 1,496,726 frs. (a rise of 123 per cent. since 1885) and the state expenditure 1,480,684 frs. (a rise of 126½ per cent. since 1885), while the surplus in 1898 was 49,382 frs.; the public debt in 1897 was 56,000 frs. (W. A. B. C.)

Basel, or BÄLE, the capital of the Swiss half canton of Basel Stadt or urban Basel. It is now the largest city in the Swiss confederation except Zürich. It is also the richest city in Switzerland, having vastly increased in wealth and importance since the opening of the St. Gotthard railway in 1882. Its statistics are as follows:—*Population*.—(1880) 60,550, (1900) 107,287. *Religious*.—Protestants, (1880) 41,308, (1888) 47,007, (1900) 70,520; Romanists, (1880) 18,556, (1888) 21,312, (1900) 36,524; Jews, (1880) 801, (1888) 1047, (1900) 1898. *Linguistic*.—German-speaking, (1880) 59,002, (1888) 67,265, (1900) 104,155; French-speaking, (1880) 1867, (1888) 1997, (1900) 2720; Italian-speaking, (1880) 324, (1888) 305, (1900) 2348. The university library now contains 220,000 volumes and 4000 MSS., while in the

"THE MEETING." By MARIE BASHKIRTSEFF.

winter of 1898-99 the matriculated students of the university numbered 332, and in that of 1899-1900, 603 (including "hearers"). A number of new buildings (e.g., the Bernouillianum and the Vesalianum) for the purposes of natural science have of late years been erected in Basel. In modern days it has become known as a centre of missionary enterprise.

Landschaft Basel* (from 1881) and ditto for the city of Basel (from 1890). (W. A. B. C.)

Bashahr, or BISHAHIR, a native state of India, within the Punjab, amid the Himalayan mountains, with an area of 3300 square miles, and a population of about 75,000. The estimated gross revenue is Rs.70,000; the tribute is Rs.39,450. The administration is temporarily in charge of a British official.

Bashan, a country on the E. side of the Jordan valley, often mentioned in the Bible. It included the Roman districts Iturea, Gaulanitis, Trachonitis, Auranitis, and Batanæa, the present Jeidûr, Jaulân, Lejá, Haurân, and Ard el-Batanfeh. The region is now remarkable for the fertility of its friable volcanic soil, and for the character of its archæological remains. It is for the most part a plateau, 1500-2000 feet above the sea, with small isolated volcanic hills rising above its surface, and near its eastern extremity the Jebel Haurân, or Jebel ed-Druz mountains. The climate is healthy and the summer heat is mitigated by the prevailing westerly winds. The soil is peculiarly suitable for the growth of wheat and barley, especially the highly-prized hard wheat. The area under cultivation has increased greatly since the railway was opened in 1894, from Damascus to Mezeirib; but much of the produce is still sent by camel to Acre and Haifa. Fruit trees and eucalyptus have been introduced on the Haurân property of Baron Edmond de Rothschild, and thrive well. At Adrááh (*Edrei*) there are subterranean dwellings which are evidently of very early date. Great interest attaches to the stone houses, built without using wood, and to the numerous temples, mausolea, reservoirs, and conduits, all constructed with basalt. Most of the buildings are the work of the Ghassanide Arabs, who came under Greco-Roman influence, and at an early period embraced Christianity. The decorative details of the temples show strong local influence, and they and the dwelling-houses have many points in common with the temples and houses, built about the same time, in the treeless districts of Moab and Edom, where, however, the material is usually limestone or sandstone. The usual identification of the Lejá with the Argob of the Bible is now rejected by some scholars.

Schumacher, *Across the Jordan*, 1886; *the Jaulân*, 1888; *Northern 'Ajlûn*, 1890. (C. W. W.)

Bashkirtseff, Maria Constantinova (Marie), (1860-1884), Russian artist and writer, was born at Gavrontsi in the government of Pultowa in Russia, on the 23rd of November 1860. When Marie was seven years old, as her father (marshal of the nobility at Pultowa) and her mother were unable through incompatibility to live together, Madame Bashkirtseff, with her little daughter, left Russia, to spend the winters at Nice or in Italy, and the summers at German watering-places. Marie acquired an education superior to that given to most girls of her rank. She could read Plato and Virgil in the original, and write four languages with almost equal facility. A gifted musician, she at first hoped to be a singer, and studied seriously in Italy to that end; her voice,

however, was not strong enough to stand hard work and failed her. Meanwhile she was also learning to draw. When she lost her voice she devoted herself to painting, and in 1877 settled in Paris, where she worked steadily in Tony Robert-Fleury's studio. In 1880 she exhibited in the salon a portrait of a woman; in 1881 she exhibited the "Atelier Julian"; in 1882 "Jean et Jacques"; in 1884 the "Meeting" (see Plate), and a portrait in pastel of a lady—her cousin—now in the Luxembourg gallery, for which she was awarded a *mention honorable*. Her health, always delicate, could not endure the labour she imposed on herself in addition to the life of fashion in which she became involved as a result of her success as an artist, and she died of consumption on the 31st of October 1884, leaving a small series of works of remarkable promise. From her childhood Marie Bashkirtseff kept an autobiographical journal; but the editors of these brilliant confessions (*Journal de Marie Bashkirtseff*, 1890), aiming apparently at captivating the reader's interest by the girl's precocious gifts and by the names of the various distinguished persons with whom she came in contact, so treated certain portions as to draw down vehement protest. This, to some extent, has brought into question the stamp of truthfulness which constitutes the chief merit of this extraordinarily interesting book. More recently a further instalment of Marie Bashkirtseff literature has been published in the shape of letters between her and Guy de Maupassant, with whom she started a correspondence under a feigned name and without revealing her identity.

See MATHILDE BLIND, *A Study of Marie Bashkirtseff*. T. Fisher Unwin, 1892.—*The Journal of Marie Bashkirtseff: an Exposure and a Defence*. By "S." (Showing that there is throughout a mistake of four years in the date of the Diary). *Black and White*, 6th Feb. and 11th April 1891, pp. 17, 304.—*The Journal of Marie Bashkirtseff*. Translated,—with an Introduction. By MATHILDE BLIND (2 vols.), London, 1890.—*The Letters of Marie Bashkirtseff*, 1 vol. (B. K.)

Basilicata, a territorial division of S. Italy, lying between Apulia, Calabria, Campania, and the sea, contains the one province of Potenza, with an area of 3845 sq. miles, and a population of (1901) 490,000. Marble, lignite, and chalk are the most important minerals worked. Mineral springs, especially sulphur springs, are abundant. Industrial activity is but little developed. Its towns are mostly small, the more important being Potenza, Avigliano, Rionero, Melfi, Matera, and Lauria.

Basim, a town and district of India, in Berar or the Haidarabad assigned districts, under British administration. The town is 52 miles south from Akola railway station. Population, about 12,000; municipal income in 1897-98, Rs.14,868.

The district of BASIM has an area of 2956 square miles. The population in 1891 was 398,179, being 135 persons per square mile. Classified according to religion, Hindus numbered 371,537; Mahomedans, 23,020; Christians, 88, of whom 17 were Europeans; "others," 3534, chiefly Jains. In 1891 the population was 353,522, showing a decrease of 11 per cent., compared with an increase of the same amount in the preceding decade. The land revenue and rates in 1897-98 were Rs.6,76,026, the incidence of assessment being nearly 9 annas per acre; the number of police was 426. The principal crops are millet, wheat, other food grains, pulse, oilseeds, and cotton. There is some manufacture of cotton-cloth and blankets. There is no railway, but the district is traversed from north to south by an old military road. In 1896-97 the number of schools was 118, attended by 4127 pupils, the proportion of boys at school being 13 per cent. of the male population of school-going age. The death-rate in 1897 was 42·7 per 1000.

Basingstoke, a municipal borough (extended 1891) and market town, in the Basingstoke parliamentary division of Hampshire, England, 19 miles N.E. by N. of Winchester by rail. A cottage hospital and a "home" for women have been built. Area, 4,194 acres; population on this area (1891), 8,213; (1901), 9,793.

Basque Provinces, an old division of Spain, now subdivided into the provinces of Viscaya or Biscay, Alava, and Guipuzcoa, for particulars of each of which see under the separate headings. The total area is 2,958 square miles; population about 570,000. The second Carlist insurrection (1870 to 1876) led to some curtailment of the almost complete local self-government previously enjoyed by these provinces, and especially to their forfeiting exemption from conscription. When the three provinces sent in their first contingent of 2046 conscripts in 1877 it was found that all but about 60 knew how to read and write, and succeeding contingents have kept up to this average of primary education. After the close of the civil war in 1876, the representatives of the three provincial councils, assisted by the senators and deputies of the Basque provinces in the Cortes, negotiated several successive pacts, each lasting some years, and the last still in force, securing for the three provinces their municipal and provincial self-government, the administration of their local affairs, and the assessment, distribution, and collection of their principal taxes and octroi duties, on the understanding that a lump sum, agreed upon beforehand, but subject to increase whenever the national taxation of other provinces was augmented, should be paid annually. These pacts have been scrupulously observed, and as the local authorities levy the contribution after their own ancient customs, landed property and the industrial and commercial classes are less heavily taxed in these territories than in the rest of Spain. Enough is raised, however, besides the amount handed over to the Government, to enable the schools, roads, harbours, and public works of every kind to be maintained at a standard which compares very favourably with that maintained elsewhere in Spain. The present provincial deputations of the three provinces have less power than the ancient "foral diputaciones"; they are now elected like the rest of the Spanish provincial councils, and are subject to the ordinary interference of the civil governors in their deliberations. (A. E. H.)

Basra, or BUSSORAH. (1) A vilâyet of Asiatic Turkey formed in 1884 by detaching the southern districts of the Baghdad vilâyet. It includes the great marshy districts of the Lower Euphrates and Tigris, and of their joint stream the Shatt el-Arab, and a sanjak, Nejd, on the western shore of the Persian Gulf. The climate is humid and unhealthy. There are large numbers of sheep, camels, and cattle. The exports are dates, wool, cereals, and indigo. Population, 950,000 (Moslems, 940,000, of whom 664,000 are Shiâs; Christians, 6000; Jews, 4000).

(2) The capital of the vilâyet, situated two miles from the right bank of the Shatt el-Arab, was founded by Midhat Pasha. It is reached from the river by a narrow winding creek, but the British Consulate and the merchants' houses are at Margil on the bank of the river. The water supply is bad, the climate trying and at times unhealthy, and there is much malarial fever. The country on both banks is liable to floods, which sometimes, as in 1896, when 2,000,000 date trees were destroyed, do much damage. The ruins of the Basra of the Khalifs and of the Arabian Nights are to the south-west of the present town. Basra is the port of transshipment from river boats to ocean steamers which run to England and India, and is the seat of a British Consul. The principal exports are wool, dates, cereals, gum, liquorice root, &c. Most of the

exports and imports are from and to Baghdad. The average exports of the five years 1894-98 were valued at £996,224, and the imports at £1,103,356.

Bassam, Grand. See IVORY COAST.

Bassano, a town of the province of Vicenza, Venetia, Italy, picturesquely situated at the foot of the Venetian Alps and on the torrential Brenta, 24 miles N.E. from Vicenza by rail. Its most important building is the museum, which contains a picture gallery and a library. Bassano also possesses a bronze statue of Garibaldi, a monument to Victor Emmanuel, and a school of industrial design. Population, about 8000; of commune, about 15,000.

Bassein, a district in the Irrawaddy division of Lower Burma, in the delta of the Irrawaddy. It has been reduced to 4090 square miles, from 8954 square miles in 1871, having given up a large tract to the district of Myaungmya formed in 1896. In 1871-72 the population of the larger area amounted to 316,883 in 1554 villages. In 1891 the smaller district had 1439 villages, with a total population of 311,262, paying in 1898-99, Rs.14,98,772 revenue. Of the population 284,349 were Buddhists and Jains, 6315 Hindus, 4741 Mahomedans, and 15,857 Christians, of whom 15,610 were natives, chiefly Karens. Of a total area of 2,617,600 acres, 472,357 were cultivated in 1898-99, and 1,125,935 acres were not available for cultivation, the cultivable area apart from fallow being 927,833 acres. The rainfall in 1898-99 was 124.56 inches. Apart from Bassein the chief town is Ngathainggyaung, which had a population in 1891 of 5608. It is a municipal town. BASSEIN, the chief town and port, which had 19,577 inhabitants in 1871, had 30,177 in 1891. It has a municipal committee of 16 members, of whom 12 are elective, and there is a central jail capable of holding 1242 prisoners. There is a large rice export from Bassein, with several steam rice mills. In 1898-99 forty sea-going vessels with a burden of 78,123 tons entered Bassein port, and 42 with a tonnage of 78,058 cleared. The vessels of the Irrawaddy Flotilla Company ply between Rangoon and Bassein by inland waters.

Bastar, a feudatory state of British India, in the Chhattisgarh division of the Central Provinces, with an area of 13,062 square miles. In 1881 the population was 196,284, and in 1891 it was 310,884, being 24 persons per square mile. In 1901 the population was 306,544, showing a decrease of 1 per cent., compared with an apparent increase of 58 per cent. in the preceding decade. The estimated revenue was Rs.2,50,162; the tribute Rs.17,200. The chief town and residence of the Raja is Jagdalpur, on the river Indravati. The principal products are rice, oilseeds, lac, tusser silk, horns, hides, wax, and a little iron. Teak timber is floated down the rivers to the Madras coast. The state is (1901) under British administration, while the young Raja is being educated at the Rajkumar college at Raipur. A good road will shortly bring Jagdalpur into connexion with the railway at Raipur.

Basti, a town and district of British India, in the Gorakhpur division of the North-West Provinces. The town, a collection of villages, is on the river Kuana, 40 miles from Gorakhpur by railway. The population in 1891 was 13,630. It has no municipality. The district has an area of 2767 square miles; the population in 1891 was 1,785,944, being 645 persons per square mile. Classified according to religion, Hindus numbered 1,510,149; Mahomedans, 275,729; Christians, 66, including 23 Europeans. In 1901 the population was 1,845,758,

showing an increase of 3 per cent. The land revenue and rates were Rs.24,26,828, the incidence of assessment being R.1:8:10 per acre; the number of police was 2476. There are no canals, but the country is watered by rivers from the hills. In 1896-97, out of a total cultivated area of 1,169,887 acres, 494,814 were irrigated from wells, tanks, &c. A railway from Gorakhpur to Gonda runs through the district; and the river Gogra is navigable. A large trade is conducted with Nepal.

Bastia, chief town of arrondissement in the island of Corsica, 94 miles N.E. of Ajaccio, by rail. The new port has 1100 feet of quayage, served by a railway, and with a depth alongside of 25 feet. The total number of vessels entered and cleared in 1899 was 620, with a tonnage of 279,823. Population (1896), 28,357.

Bastian, Adolf (1826—), German ethnologist, was born at Bremen 26th June 1826. From his early years he devoted himself to travel. Proceeding to Australia in 1851 as surgeon on a vessel, he had visited almost every part of the world before his return in 1859. In 1861 he departed on an expedition to the Far East, which lasted five years. Upon his return he commenced the publication of his great work on *The Peoples of Eastern Asia*, an immense store-house of facts owing little to arrange-

times undertook further scientific travels in Africa, South America, and India. The results of these explorations were made public in a long series of separate publications, comprising several on Buddhism, and on the psychological problems presented by native superstitions. Bastian also edited the *Zeitschrift für Ethnologie* from 1869, in conjunction with Virchow and Robert von Hartmann. On his seventieth birthday, 1896, he was presented with a volume of essays composed by the most distinguished ethnologists in celebration of the event, and dedicated to him.

Bastien-Lepage, Jules (1848-1884), French painter, was born in the village of Damvillers, Meuse, France, on the 1st of November 1848, and spent his childhood there. He first studied at Verdun, and prompted by a love of art went in 1867 to Paris, where he was admitted to the École des Beaux Arts, working under Cabanel. After exhibiting in the Salons of 1870 and 1872 works which attracted no attention, in 1874 he made his mark with his "Song of Spring," a study of rural life, representing a peasant girl sitting on a knoll looking down on a village. His "Portrait of my Grandfather," exhibited in the same year, was not less remarkable for its artless simplicity, and received a third-class medal. This success was confirmed in 1875 by the "First Communion," a picture of a little girl minutely worked up as to colour, and a "Portrait of M. Hayem." In 1875 he took the second Prix de Rome with his "Angels appearing to the Shepherds," exhibited again in 1878. His next endeavour to win the Grand Prix de Rome in 1876 with "Priam at the Feet of Achilles" was again unsuccessful (it is in the Lille gallery), and the painter determined to return to country life. To the Salon of 1877 he sent a full-length "Portrait of Lady L." and "My Parents"; and in 1878 a "Portrait of M. Theuriet" and "The Hayfield." The last picture, now in the Luxembourg gallery, is regarded as a typical work from its stamp of realistic truth. Thenceforth Bastien-Lepage was recognized in France as the leader of a school, and his "Portrait of Mme. Sarah Bernhardt," 1879, painted in a light key, won him the Cross of the Legion of Honour. In 1880 he exhibited a small portrait of M. Andrieux and "Joan of Arc listening to the Voices"; and in the same year, at the Royal Academy, the little portrait of the "Prince of Wales." In 1881 he painted "The Beggar" and the "Portrait of Albert Wolf"; in 1882 "Le Père Jacques"; in 1883 "Love in a Village," in which we find some trace of Courbet's influence. His last dated work is "The Forge," 1884. The artist, long ailing, had tried in vain to re-establish his health in Algiers. He died in Paris, 10th December 1884, when planning a new series of rural subjects. Among his more important works may also be mentioned the portrait of "Mme. J. Drouet," 1883; "Gambetta on his Death-bed," and some landscapes; "The Vintage," 1880, and "The Thames at London," 1882. "The Little Chimney-Sweep" was never finished. An exhibition of his collected works was opened in March and April 1885.

A SKETCH-MODEL FOR JOAN OF ARC.

Basutoland, a British protectorate in South Africa occupying the upland region enclosed by the Drakenberg range on the south, and northwards by the Caledon affluent of the Orange river. It is thus coterminous towards the south with Cape Colony, north-eastwards with Natal, and on the north and south-west with Orange River Colony, and has an area of about 10,300 square miles, with a population which increased from over 218,000 in 1891 to 250,000 in 1895, and in 1900 was estimated at nearly 300,000. The "Switzerland of South Africa," as it has been called, forms a continuous rugged and broken plateau at a mean altitude of about 6000 feet, and is traversed in its entire length by the Maluti ("Blue") range, running north of and parallel with the Drakenberg. Towards Natal the two systems converge in the huge table-shaped Potong (Antelope), to which the French missionaries have given the name of *Mont aux Sources*, because on its slopes have their rise the head-streams of the Tugela flowing to the Indian Ocean, and of the Orange flowing to the Atlantic. Above Potong, itself over 10,000 feet high, tower other mountains, such as Cathkin or Champagne Castle (10,520), and Hamilton (10,700 ft), culminating point of Africa south of the Zambesi. Besides the Caledon, Basutoland is watered by the Senku ("Black Water") and the Kornet-spruit, which descend from Potong, and after traversing the plateau between the Drakenberg and Maluti ranges, converge in a single channel to form the Orange above Herschel. Owing to the abundance of running waters and a sufficiently copious rainfall, the uplands form excellent grazing grounds for vast numbers of cattle and horses (the hardy and sure-footed "Basuto ponies"), while the finest crops of cereals in South Africa are raised on the fertile banks of the Caledon. The country takes its name from its Basuto inhabitants, a brave and highly intelligent branch of the Bechuana nation, who have been evangelized by French Protestant missionaries, and now form perhaps the most orderly and most flourishing Christian community in Africa. The Basutos were not originally confined to their present highland territory, but ranged over both banks of the Caledon, and beyond them in the direction of the Vaal. In fact, the whole region corresponding to the present Orange River Colony formed part of the Basuto domain until they were dispossessed and driven to the uplands by the early Boer settlers. For fiscal and judicial purposes the country is divided into the seven districts of Maseru, Leribe, Mohale's Hock, Berea, Mafeking, Quthing, and Qacha's Nek, and each district is subdivided into wards ruled by hereditary chiefs, all members of the Moshesh family. Maseru, the capital and largest town, lies on the left bank of the Caledon, a little below Ladybrand on the opposite side, and has an estimated population of about 1000 (Europeans, 120). There are indications of iron and copper, while coal of a fair quality occurs in several parts, and is worked for the local supply. But agriculture is the chief resource of the people, the yield of grain, cattle, and wool being sufficient to support a brisk export trade, valued in 1898 at £138,500. In the same year the imports (saddlery, clothes, groceries, iron and tin ware) exceeded £100,000, and in 1899 the revenue (£46,847) more than balanced the expenditure (£46,417). The hut tax yielded £23,678, although, owing to the scarcity of food during 1899, only ten shillings a hut was levied instead of the one pound that is chargeable. There is no public debt. The 144 schools (chiefly missionary) are regularly attended by about 9000 pupils, and supported by a grant in aid of £4440. Many of the Basutos speak and write English fluently, and dress in the European manner.

Recent History.—The Basutos belong to the mountain tribes of the great Bantu race. They appear to combine in a remarkable manner the fighting qualities of the coast tribes, such as the Zulus, with the higher intelligence and cunning of the interior tribes, such as the Bechuanas. They are hardy and industrious; Moshesh, the founder of the Basuto tribe, and for a long lifetime the leader of his people, was a striking example of the strongest qualities to be found in a Bantu chief. The Basuto tribe formed itself under the leadership of Moshesh, out of remnants of various other Bantu tribes, which had been broken up by the Zulu chief Chaka. There is no people among whom personal *kudos* counts for more than it does amongst the Bantu, and the rising reputation of Moshesh as a hunter and warrior brought him, while quite young, many followers from the surrounding tribes. The Basutos at the outset acquired an unenviable notoriety as a race of bold cattle lifters and raiders, and in their early settlements the emigrant Boers found them extremely troublesome neighbours. At the same time, if the Basutos were eager for cattle, it is equally certain that the Boers were eager for land; and their encroachments on the territories of the Basutos led to a proclamation in 1842 from Sir George Napier, the then Governor of Cape Colony, forbidding further encroachments on Basutoland. In 1843 a treaty was signed with Moshesh on the lines of that already arranged with Waterboer, the Griqua chief, creating Basutoland a native state under British protection. Notwithstanding this treaty, the cattle-stealing propensities of the Basutos continued to manifest themselves; and a commando, consisting of British troops, farmers, and natives, was sent against Moshesh in 1849. This commando did not prove strong enough to accomplish its end, and was repulsed by Moshesh.

The ambition of Moshesh led him to endeavour to regain if possible the territories south of the Vaal and west of the Drakensberg, which had been at one time occupied by those very Bantu tribes from whom many of his retainers were drawn. In 1852 General Cathcart, who succeeded Sir Harry Smith as governor of Cape Colony, decided to take strong measures with the tribe, and proceeded with three small divisions of troops against Moshesh. The expedition was by no means a success, but Moshesh, with that peculiar statecraft for which he was so famous, saw that he could not hope permanently to hold out against the British troops, and followed up his successful skirmishes with General Cathcart by writing him a letter, in which he said: "As the object for which you have come is to have a compensation for Boers, I beg you will be satisfied with what you have taken. You have shown your power, you have chastised; I will try all I can to keep my people in order in the future." In this instance Moshesh displayed similar cunning strategy to that which he had used so successfully against the Matabele warrior, Moselekatze, twenty years before, when he followed up his victory by sending a letter after the retreating enemy couched in the following terms: "Moshesh salutes you. He sends you these cattle as a recognition of your bravery. . . . He desires to live at peace with you." This diplomatic letter was so successful in its object that Moselekatze never attacked him again. In reference to this letter and to the other diplomatic correspondence of this astute chief, it is only fair to state that he owed a good deal to the assistance of two missionaries attached to the French Protestant Mission in Basutoland, Mr Dyke, an Englishman, and M. Cassalis, a Frenchman. At the same time revelations of recent date show that while these gentlemen believed themselves to be guiding Moshesh, they were

frequently used by this wily chief when occasion served him.

In 1865 a fresh feud occurred between the Orange Free State Boers and the Basutos. The latter applied to Sir Philip Wodehouse at the Cape for protection, but he declined to interfere. The Boers proved more successful than they had been in the past, and occupied several of the Basuto strongholds. They also annexed a certain fertile portion of Basuto territory, and finally terminated the strife by a treaty at Thabo Bosigo, by which Moshesh gave up the tract of territory taken by the Boers and professed himself a subject of the Free State. Seeing that the struggle against the Boers was hopeless, no fewer than 2000 Basuto warriors having been killed, Moshesh again appealed for protection to the British authorities, saying: "Let me and my people rest and live under the large folds of the flag of England before I am no more." In response to this request, the British authorities decided to take over Basutoland, and a proclamation of annexation was issued. At the same time the Boer commandoes were requested to leave the country. The Free State strongly resented the British annexation of Basutoland, and in 1869 the treaty of Aliwal North was concluded between the Free State and the High Commissioner. This treaty defined the boundary between the Free State and Basutoland, whereby the fertile strip of country west of the Caledon River was finally transferred to the Free State, and the remainder of Basutoland was recognized as a portion of the British dominions. It further dealt with cattle thefts, and made special provisions enabling the Free State Boers to trace and recover at any time stock which the Basutos might steal.

Moshesh, who for nearly fifty years had led his people so skilfully and well, died in 1870. In 1871 Basutoland was annexed to Cape Colony, the area at that time being given as 10,300 square miles. The turbulent Bantu warriors did not remain quiet for any length of time, and in 1879 Moirosi, a chief residing in the southern portion of Basutoland, openly repudiated colonial rule. An expedition was despatched from Cape Colony and severe fighting followed. Moirosi's stronghold was captured and the chief himself was killed. Immediately after the war, strife occurred among the Basutos themselves over the question of the partition of Moirosi's territory, which had been decided on as one of the results of the war. In 1880 the Cape Government felt sufficiently strong to extend to Basutoland the Cape Peace Preservation Act of 1878. This Act provided for the disarmament of natives, and had already been put in force successfully among some of the Kaffir tribes on the Cape eastern frontier. Its execution in Basutoland, however, proved an extremely difficult task, and was never entirely accomplished. Desultory warfare was carried on between the colonial troops and the Basutos until 1881, when the intervention of the High Commissioner, Sir Hercules Robinson, was asked for. Peace in Basutoland was not announced until the end of 1882. In the following year a form of self-government was established, but was once more followed by internal strife among the petty chieftains.

The subjection of Basutoland to the control of the Cape Government had by this time proved unsatisfactory, both to the Basutos and to Cape Colony. The Basutos on their part found that self-government involved not only strife amongst themselves, but also serious danger from their Free State neighbours, and they appeared desirous that Basutoland should be taken under the direct administration of the Imperial Government. The Cape Government found, that owing to their endeavour to disarm the Basutos, including the "gun war" of 1880, they had incurred an expenditure of three millions, and they were by no means pleased at the prospect of a continued governing of the country. They

therefore offered no opposition to the appeal made by the Basutos themselves to the Imperial Government to take them over, and, moreover, Cape Colony undertook to pay towards the cost of administration an annual contribution of £18,000. Consequently, in 1884, Basutoland ceased to be a portion of the Cape Colony and became a British Crown Colony. A period of comparative quiet followed, and in 1891 Basutoland was admitted to the Customs Union, which already existed between Orange Free State, Cape Colony, and British Bechuanaland. The country has since been administered by a Resident Commissioner and a small staff of officials, and when Lord (then Sir Alfred) Milner visited Basutoland in 1898, on his way to Bloemfontein, he was received by fifteen thousand mounted Basutos. The chiefs also attended a large meeting at Maseru, and gave expression to their gratitude for the beneficent character of Queen Victoria's rule and protection. On the outbreak of the Boer war in 1899, these same chiefs, at a great meeting held in the presence of the Resident Commissioner, gave a further protestation of their loyalty to Her Majesty. There can be no question that the conversion of Basutoland into a Crown Colony, administered by a British Resident Commissioner responsible to the Colonial Office, has contributed alike to the prosperity of the Basutos, the security of the property of neighbouring colonists, and a peaceful condition among the natives of South Africa generally. The annual report of the resident commissioner, Sir Godfrey Lagden, for the year 1899, is adequate testimony to this success. During the year no less than 37,371 passes were given to natives who visited the neighbouring states and colonies in search of work. With regard to the influence of education amongst the Basutos, Sir Godfrey Lagden reported as follows:—"The ability to imbibe technical knowledge and earn good wages, the desire to possess money, to wear decent clothes, to have respectable houses and furniture, to educate the children and have their own churches and schools, are automatically working social changes which no laws can so well effect."

Batabano, a small village on the south coast of Cuba opposite Havana and the terminus of the south coast steamer trade of Havana. The original settlement of Havana made under Diego Velasquez about 1517 was near this place. Population, 1025.

Bataisk, a wealthy village of South Russia, 5 miles south of Rostov-on-Don. It has a population of more than 10,000, and is a centre for trade in grain and cattle.

Batala, a town of British India, in the Gurdaspur district of the Punjab, with a station on a branch of the North-Western Railway, 24 miles from Amritsar. The population is about 27,000; the municipal income in 1897-98 was Rs.33,664. It is an important centre of trade, with manufactures of cotton and silk goods, shawls, brass-ware, and leather. There are two mission schools.

Batalpashinsk, a district town of Russia, North Caucasus, province of Kubañ, on the left bank of Kubañ river, 27 miles S. of Nevinnomysskaya station on the North Caucasian railway. Timber is exported, and there is an important sawmill. Salt is obtained from lakes of the same name, situated 10 miles from the town. Population (1897), 8100.

Batangas, a well-built town of some 40,000 inhabitants, in the island of Luzon, Philippine Islands, and capital of the province of Batangas. It is well

situated on the eastern coast of the Gulf of Batangas, and is the most important port of a province noted for the fertility of its soil and the industry of its inhabitants. Its exports, which are large, include rice, coffee of excellent quality, cacao, sugar, Indian corn, horses, and cattle. The horses of Batangas are unusually strong and active. Good cotton is also produced, and is woven into fabrics by the women. The language is Tagalog.

Batavia, a residency on the north coast of West Java, consisting of the districts of Batavia (town and suburbs), Meester Cornelis, Tangerang, and Buitenzorg. It is bounded on the S. by the mountains and volcanoes of the residency of Preanger, in which the rivers (which, with the sea, have formed the broad band of alluvium in the north of the residency) Jidani, Jilivong, Jitarum, take their rise. In this fertile region are situated the private estates of Europeans and Chinese, and the orchards and fruit gardens near the capital. On the higher lands of the residency coffee, tea, cloves, and cinnamon are cultivated. Area, 2595 square miles. Population in 1898, 1,313,383, including 12,434 Europeans, 82,510 Chinese, 3,279 Arabs, 147 other Asiatic foreigners.

The capital, of the same name, is the chief town of all the Dutch East Indian Colonies, and lies in 106° 50' E., 6° 8' S. Since 1874 the progress of the commerce and shipping of the town must be mainly attributed to the improvement in its communication with other residencies and its harbour improvements. Since 1873 the old and new towns have been connected by steam tramways. The Batavia-Buitenzorg railway passes the new town, thus connecting it with the main railway which crosses the island from west to east. But the construction of the new harbour at Tanjong Priok, to the east of the old one, is of the first importance. The works, commenced in 1877 and completed in 1886, connect the town with Tanjong ("cape") Priok by a canal and include an outer port formed by two breakwaters 6072 feet long, with a width at entrance of 408 feet and a depth of 27 feet throughout. The inner port has 3282 feet of quayage; its length is 3609 feet, breadth 573 feet, and depth 24 feet. There is also a coal dock, and the port has railway and roadway connexion with Batavia. The total cost of these works has been £2,250,000. The tonnage of vessels clearing from Batavia to countries beyond the archipelago has increased from 879,000 tons in 1887 to 1,224,000 tons in 1898. The population of the town in 1880 was 96,957; in 1898, 115,567; including 9423 Europeans, 26,433 Chinese, 2828 Arabs, and 132 other Asiatic foreigners.

LITERATURE.—Van REES. *Batavia*. Leiden, 1881.—BUYS. *Batavia, Buitenzorgen de Preanger*. Batavia, 1892.

Batavia, capital of Genesee county, New York, U.S.A., situated in 43° 00' N. lat., and 78° 11' W. long., in the western part of the state, 36 miles east of Buffalo, on Tonawanda Creek, at an altitude of 890 feet. It is on three railways, the New York Central, the Lehigh Valley, and the New York, Lake Erie, and Western. Its manufactures consist largely of agricultural tools and machines. Population (1880), 4845; (1890), 7221; (1900), 9180.

Bates, Harry (1850-1899), English sculptor, was born at Stevenage, Herts, on 26th April 1850. Before beginning the regular study of plastic art he passed through a long apprenticeship in architectural decoration. In 1879 he came to London and entered the Lambeth School of Art, studying under Jules Dalou, and winning a silver medal in the national competition at South Kensington. In 1881 he was admitted to the Royal Academy schools, where in 1883 he won the gold medal and the travelling scholarship of £200 with his relief of "Socrates

teaching," which showed the qualities of grace of line and harmony of composition which always distinguished his work. He then went to Paris and studied under Rodin. A head and three small bronze panels (the "Odyssey") executed by Bates in Paris were exhibited at the Royal Academy, and selected for purchase by the Chantrey Trustees; but the selection had to be cancelled because they had not been modelled in England. His "Æneas" (1885), "Homer" (1886), three "Psyche" panels, and "Rhodope" (1887), all showed marked advance in form and dignity; and in 1892, after the exhibition of his vigorously designed "Hounds in Leash," Bates was elected A.R.A. His "Pandora" in the same year was bought for the Chantrey Bequest, and is now in the Tate Gallery. Among his later work was the colossal equestrian statue of Lord Roberts (1896), cast in bronze and set up in Calcutta; and a statue of Queen Victoria for Dundee. But perhaps his masterpiece, showing the sculptor's delicate fancy and skill in composition, was an allegorical presentment of "Love and Life"—a winged male figure in bronze, with a female figure in ivory being crowned by the male. Bates died in London 30th January 1899, his premature death robbing English plastic art of its most promising representative at the time.

Bates, Henry Walter (1825-1892), English naturalist and explorer, was born at Leicester on 8th February 1825. His father, a manufacturing hosier, intended him for business, and for a time the son yielded to his wishes, escaping as often as he could into the neighbouring country to gratify his love of botany and entomology. This determined his future, and in 1844, meeting a congenial spirit in Alfred Russel Wallace, the result was discussion and execution of a plan to explore some then little known region of the globe. The banks of the Amazons was the district chosen, and in April 1848 the two friends sailed in a trader for Pará, which was reached in a month. They had little or no money, and, as the expenses were to be met by the sale of duplicates of specimens, work was begun on arrival. After two years Bates and Wallace agreed to collect independently, Wallace taking the Rio Negro and the upper waters of the Orinoco, while Bates continued his route up the great river for 1400 miles. He remained in the country eleven years, during which time he collected no fewer than 8000 species of insects new to science. His long residence in the tropics, with the privations which it entailed, undermined his health, and he returned to England the victim of chronic dyspepsia. Nor had the exile from home the compensation of freeing him from financial cares, which hung heavy on him till he had the good fortune to be appointed in 1864 assistant secretary of the Royal Geographical Society, a post which, to the inestimable gain of the Society, and the advantage of a succession of explorers, to whom he was alike Nestor and Mentor, he retained till his death on 16th February 1892. So far as an authoritative position in the scientific world was concerned, Bates had secured this by two publications the importance and interest of which are abiding. He is best known as the author of one of the most delightful books of travel in the English language, *The Naturalist on the River Amazons* (1863), the writing of which, as the correspondence between the two has shown, was due to Darwin's persistent urgency. "Bates," wrote Darwin to Lyell, "is second only to Humboldt in describing a tropical forest." But his most memorable contribution to biological science, and more especially to that branch of it which deals with the agencies of modification of organisms, was his paper on the "Insect Fauna of the Amazon Valley," published in vol. xxiii. of the *Linnean Society's Transactions*. He therein, as Darwin

testified, clearly stated and solved the wonderful problem of "mimicry," as it is conveniently called, or the superficial resemblances between totally different species; and the likeness between an animal and its surroundings, whereby it evades its foes or conceals itself from its prey. The species which has varied most from the normal type of its group is far rarer than the form which it resembles, while the mimicked is abundant and well defended by such devices as unpleasant taste or smell, or the power of stinging or wounding. The basis of mimetic analogies lies in the origination of some slight variation in the mimicker, which tends in the direction of likeness to the mimicked, upon which variation natural selection operates. Bates's other contributions to the literature of science and travel were sparse and fugitive, but he edited for several years a periodical of *Illustrated Travels*. A man of varied tastes, he devoted the larger part of his leisure to entomology, notably to the classification of coleoptera. Of these he left an extensive and unique collection, which, fortunately for science, was purchased intact by M. René Oberthur of Rennes. (E. CR.)

Bath, a city, municipal, county, and parliamentary borough, market town, and fashionable watering-place, in the county of Somerset, England, on the Avon, 107 miles W. of London by rail. The borough is divided into seven wards under a mayor, 14 aldermen, and 42 councillors. The corporate property yields a gross income of £8500. The new municipal buildings, costing £38,000, were erected in 1894. Other recent buildings include a Roman Catholic church, new Queen's Baths, Jubilee Hall, Bath Church Institute, Lyric Theatre, and a handsome art gallery (1900) erected as a memorial of the Diamond Jubilee. A new public park was opened in 1897. To the list of charitable institutions have been added four dispensaries, including the Hahnemann Free Dispensary (1888). Bath publishes two daily and five weekly newspapers. Since 1875 excavation has been carried on with the result of exposing the baths erected during the Roman occupation, in wonderful preservation, portions of a church erected in the 9th century, and other antiquities. Area of city and municipal borough, 3382 acres; population (1881), 51,814; (1901), 49,817. Area of parliamentary borough, 3455 acres; population (1881), 53,785; (1901), 52,751.

See KING's *Municipal Records* (1885); BRITTON's *History of Bath Abbey Church* (1887); PRACH's *Bath, Old and New* (1888); and *Collections of Books belonging to the City* (1893); *Handbook to Bath*, edited by J. W. MORRIS (1888); DAVIS's *Guide to the Roman Baths* (1883); *Excavations of Roman Baths* (1895); and *The Saxon Cross* (1898).

Bath, a city and port of entry of Maine, U.S.A., and capital of Sagadahoc county, situated in the southern part of the state, on the west bank of Kennebec river, 12 miles above its mouth, where it is broad and navigable for all classes of vessels. It was formerly one of the most prominent centres of wooden shipbuilding, and its ships are still found in all parts of the world. In recent years the building of iron ships has become of importance, the Bath Iron Works having constructed a number, among them several smaller ships of the U.S. navy. Population (1880), 7874; (1890), 8723; (1900), 10,477.

Bathgate, a burgh of barony and police burgh of Linlithgowshire, Scotland, 19½ miles west by south of Edinburgh by rail. The academy had in 1898-99 an average attendance of 831, while a Board school had 352, and a Roman Catholic school 205. Population (1901), 6786.

Bathurst, a city in Australia, New South Wales, 144 miles west of Sydney on the Great Western Railway, in the centre of the chief wheat-growing district of the colony, on the south bank of the Macquarie river. It has been a municipality since 1862. Altitude, 2200 feet.

Mean temperature, year, 57·6° F.; January, 72·6°; July, 43·3°. Population about 10,000.

Batley, a municipal borough of Yorkshire, England, distant 8 miles from Leeds by rail, and about the same distance from Wakefield and Bradford. With the adjacent municipal borough of Dewsbury it forms part of the parliamentary borough of Dewsbury. All Saints' Church contains ancient memorials, and there are an ancient grammar school, a technical school (established by public subscription), a town hall, a hospital, a market house, and public baths. The town is the centre of the heavy woollen trade, and has extensive manufactures of army cloths, pilot cloths, druggets, flushings, &c.; also iron foundries, manufactures of machinery, and stone quarries. The borough lies in the south-west Yorkshire coalfield, and there are a number of collieries in the district. Area, 2039 acres. Population (1881), 27,505; (1901), 30,321.

Baton Rouge, a city of Louisiana, U.S.A., capital of East Baton Rouge Parish. It was made the state capital in 1849. In 1862 the seat of government was transferred to New Orleans, and in 1880 it was restored to Baton Rouge. It is the seat of Louisiana State University. Population (1880), 7197; (1890), 10,478; (1900), 11,269, of whom 4660 were white and 6596 negro.

Battaglia, a town of the province of Padua, Venetia, Italy, 11 miles S.S.W. from Padua by the railway to Bologna. It lies on the Euganean Hills, and has much-frequented hydropathic and hot sulphur springs, which supply *inter alia* mud baths and a natural vapour bath. The springs gush out at the foot of Mount Sant' Elena, and have a temperature of 136·4° to 159·8° F. In the immediate vicinity are the castle of Cattajo, built in 1550, and the church of Arqua Petrarca, in which is the tomb of Petrarch; there also is the house in which he lived, now containing relics of the poet. Building stone is quarried. Population, about 3700.

Battambang (locally known as PRATTABAWNG), situated in 103° 13' E. long. and 13° 6' N. lat., lies in the great Cambodian plain upon the river Sangk, which drains from the Patat range into the great lake to the eastward. It is the chief town of the Cambodian province of the same name, and was conquered by the Siamese at the end of the 18th century, at the same time as the neighbouring province of Siemrap. If the Pailin district (for which see CHANTABUN) is excepted, the chief products of the province are rice and dried fish. The total value of the export and import trade of the two provinces of Battambang and Siemrap does not at present exceed £100,000 a year. The population of the town is about 5000, and that of the province scarcely 50,000. A hereditary chief of Cambodian descent resides within the brick walls of the old citadel, and since 1893 a commissioner appointed from Bangkok has resided at Sis.

By the terms of the treaty of October of that year between France and Siam, the Siamese Government bound itself not to maintain or navigate ships or armed vessels on the Great Lake, nor to construct any fortified port or military establishment, nor to maintain any armed force in the provinces of Battambang and Siemrap. A clause was introduced to encourage trade between French Cambodia on the south and these lake provinces, but owing to the high tariff imposed in the French colonies the bulk of the trade still goes overland to Bangkok in preference to the easier water route to Saigon.

Battas (Dutch *Battaks*), the inhabitants of the formerly independent Batta country, in the central highlands of Sumatra, now for the most part subjugated to the Dutch government (1832-90). The still independent area extends from 98°-99° 35' E., and 2°-3° 25' S. North-east of Toba lake dwell the Timor Battas, and west of it the Pakpak, but on its north (in the mountains which

border on the east coast residency) the Karo Battas form a special group which, by its dialects and ethnological character, appears to be allied to the Gajus and Allas occupying the interior of Achin. The Battas are engaged in agriculture (rice, *kapas*, indigo), in horse and pig breeding, and in gathering the products of the forests.

Gen.* 1885-87.—Van DIJK in the same periodical, 1890-95.—WING EASTON in the *Jaarboek voor het Mynwezen*, 1894.—NIEMANN in the *Encyclopedie van Nederlandsch-Indie*, under the heading *Bataks*, with very detailed bibliography.

Batticaloa, the provincial capital of the eastern province of Ceylon, on the E. coast, 69 miles S.S.E. of Trincomalee. The population of the town in 1901 was about 8000; of the district (2872 square miles), 145,155. The old Dutch "Fort" is a mere name. Batticaloa is the seat of a government agent and district judge; criminal sessions of the supreme court are also held. Rice and cocoanuts are the two staples of the district, and a steamer trading round the island calls once a week at the port. The lagoon is famous for its "singing fish"; the district has a remnant of Veddahs or wildmen of the wood. The average annual rainfall is 55½ inches; the average temperature 80°4°.

Battle Creek, a city of Calhoun county, Michigan, U.S.A., situated on Kalamazoo river, at the mouth of Battle Creek, in the southern part of the lower peninsula, at an altitude of 820 feet. It has three railways, which give communication in all directions. It is the seat of Battle Creek College, contains a sanatorium, and has extensive manufactures, largely of agricultural implements. Population (1880), 7063; (1900), 18,563.

Batu (Dutch *Batoe*), a group of three greater and forty-eight lesser islands between 0° 10' N. to 0° 45' S. and 97° 50'-98° 35' E., belonging to the Ayer-bangi district of the lowlands of Padang (Sumatra). They are separated by the strait of Sibirut from the Mentavei group. Only twenty of the smaller islands are inhabited. The natives are of Malay-Buginese origin.

Batum, a seaport of Russia, Transcaucasia, province and 85 miles by rail S.E. of Kutais, on the south-east shore of the Black Sea, in 41° 39' N. and 41° 38' E., near the mouth of the Chorokh; annexed from Turkey in 1878. The bay of Batum is being continually filled up by the sand that is carried into it by several small rivers. It is protected by strong forts, and the anchorage has been greatly improved by artificial works. The town is built on the steep slopes of the hills on its western shore. The climate is very warm, lemon and orange trees, magnolias and palms growing in the open air, but it is extremely wet and changeable. The yearly amount of rain (90 inches) is higher than anywhere in Caucasia, but is very unequally distributed (23 inches in August and September, sometimes 16 inches in a couple of days), and the town is still most unhealthy. Only bridle-paths connect Batum with the interior.

Batum has grown rapidly in recent years. It is now connected by rail with the main line of Transcaucasia, and is the chief port of the whole country for the export of naphtha, paraffin oil, liquorice, wheat, Indian corn, and timber (about £4,000,000 a year). Some 800 vessels are engaged in foreign trade, and 500 coasting vessels visit it every year. Population (1875), 2000; (1897), 28,500, very mixed. The district of Batum (85,576 inhabitants, with Batum town, in 1897), with the districts of Artvin and Ajar (56,456), formerly made a separate province of Batum. They are now two military districts of the province of Kutais.

Bauan, a town of 30,000 inhabitants, in Luzon, Philippine Islands, situated near the head of the Gulf of

Batangas. It is noted for having an unusually fine church. The surrounding country is very fertile, and cacao, pepper, cotton, hemp, coffee, and rice are produced in abundance. Cattle and horses are raised for the Manila market. The women weave and dye cotton and hempen fabrics. The language is Tagalog.

Bauchi. See NIGERIA.

Baudry, Paul Jacques Aimé (1828-1886), French painter, was born at La Roche-sur-Yonne (Vendée). He studied under Drolling, a sound but second-rate artist, and carried off the Prix de Rome in 1850 by his picture of "Zenobia found on the banks of the Araxes." His talent from the first revealed itself as strictly academical, full of elegance and grace, but somewhat lacking originality. In the course of his residence in Italy Baudry derived strong inspiration from Italian art with the mannerism of Correggio, as was very evident in the two works he exhibited in the Salon of 1857, which were purchased for the Luxembourg: "The Martyrdom of a Vestal Virgin" and "The Child." His "Leda," "St John the Baptist," and a "Portrait of Beulé," exhibited at the same time, took a first prize that year. Throughout this early period Baudry commonly selected mythological or fanciful subjects, one of the most noteworthy being "The Pearl and the Wave." Once only did he attempt a historical picture, "Charlotte Corday after the murder of Marat" (1861), and returned by preference to the former class of subjects or to painting portraits of illustrious men of his day—Guizot, Charles Garnier, Edmond About. The works that crowned Baudry's reputation were his mural decorations, which show much imagination and a high artistic gift for colour, as may be seen in the frescoes in the Paris Cour de Cassation, at the Château of Chantilly, and some private residences—the Hôtel Fould and Hôtel Paiva—but, above all, in the decorations of the foyer of the Paris Opera House. These, more than thirty paintings in all, and among them compositions figurative of dancing and music, occupied the painter for ten years. Baudry died in Paris in 1886. He was a member of the Institut de France, succeeding Schnetz. Two of his colleagues, Dubois and Mercié, co-operating with his brother, Baudry the architect, erected a monument to him in Paris (1890). The statue of Baudry at La Roche-sur-Yonne (1897) is by Gérôme.

(H. FR.)

Bauer, Bruno (1809-1882), German theological and historical critic, was born 6th September 1809, the son of a painter in a porcelain factory at Eisenberg in Saxe-Altenburg. He was educated at Berlin, where he fell under the then all-powerful influence of Hegel, attaching himself to the "right" of the Hegelian school under Marheineke. In 1834 he began to teach in Berlin as a licentiate of theology, and in 1839 was transferred to Bonn. Meanwhile his opinions had been changing, and in two works, *Kritik der evangelischen Geschichte des Johannes* (1840) and *Kritik der evangelischen Geschichte der Synoptiker* (1841), he announced his complete rejection of his earlier orthodoxy. In 1842 the Government, having taken the opinions of the various Prussian faculties of theology, revoked his license to teach, and he retired for the rest of his life to Rixdorf, near Berlin. Henceforward he took a deep interest in modern history and politics, as well as in theology. Among the fruits of his new studies were *Geschichte der Politik, Kultur und Aufklärung des 18. Jahrhunderts*, in 4 vols. (1843-45), and *Geschichte der Französischen Revolution*, in 3 vols. (1847). He kept up this line of interest till the end, and *Disraelis romantischer und Bismarcks socialist*

ischer Imperialismus was published in the year of his death. Other critical works are *Kritik der Evangelien und Geschichte ihres Ursprungs*, 4 vols. (1850-52), *Apostelgeschichte* (1850), *Kritik der Paulinischen Briefe*, 3 parts (1850-52). He died at Rixdorf, 13th April 1882. Bruno Bauer's criticism of the New Testament was of a highly destructive type, going far beyond the most sceptical conclusions of the Tübingen school. Strauss in his *Life of Jesus* had accounted for the Gospel narratives as half-conscious products of the mythic instinct working in the early Christian communities. Bauer ridiculed Strauss's notion that a community could produce a connected narrative. "A community has no hands for writing, no judgment for composing." His own doctrine, embodying a theory of Wilke's, was that the original narrative was the Gospel of St Mark; that this was composed in the reign of Hadrian; and that after this, as a type, the other narratives were modelled by other writers. On the same principle the four principal Pauline epistles were regarded as forgeries of the second century. The other main point in Bauer's criticism was his argument for the preponderance of the Greco-Roman element, as opposed to the Jewish, in the Christian writings. The writer of St Mark's Gospel was "an Italian, at home both in Rome and Alexandria"; that of St Matthew's Gospel "a Roman, nourished by the spirit of Seneca"; the Pauline epistles were written in the West in antagonism to the Paul of the Acts, and so on. Christianity is essentially "Stoicism triumphant in a Jewish garb." Needless to say, this line of criticism has not been generally accepted, though it has found occasional supporters, especially in the Netherlands. It certainly had its value in emphasizing the importance of studying the influence of environment in the formation of the Christian Scriptures. Bauer was a man of restless, impetuous activity and independent, though ill-balanced, judgment, one who, as he himself perceived, was more in place as a free-lance of criticism than as an official teacher. He came in the end to be kindly regarded even by opponents, and he was not afraid of taking a line displeasing to his Liberal friends on the Jewish question. (H. S.)

Bautzen, a town of Germany, on the Spree, 32 miles E.N.E. of Dresden, capital of the circle of Bautzen, kingdom of Saxony, on the Dresden-Görlitz and the Bautzen-Neustadt railways. The town has a clerical college, 2 normal schools (one for Protestant, the other for Catholic teachers), 2 higher, a Wendish, an agricultural, an industrial, a commercial, and other schools. A centre of industry, it has iron foundries, dyeworks, potteries, distilleries, and cigar factories. Population (1890), 21,515; (1895), 23,678; (1900), 26,025.

Bavaria, a kingdom of Germany, ranking next after Prussia in both area (29,284 square miles) and population—5,420,199 (1885); 5,818,544 (1895), of whom 2,846,687 were males and 2,971,857 females, the density being 198·7 inhabitants to the square mile. Of the population 64·5 per cent. were rural and 35·5 per cent. urban. The preliminary results of the 1900 census placed the total population at 6,175,153. During the years 1880 to 1893 the number of emigrants from Bavaria ranged from 8068 to 17,986 per annum; since 1893 it has averaged not more than 3256. Classified according to religion, the population in 1895 was thus distributed:—4,112,623 Roman Catholics (70·7 per cent.), 1,640,133 Evangelical Protestants (28·2 per cent.), 53,750 Jews, and 10,964 of other Christian sects (of whom 3249 were Mennonites). Illegitimacy ranks high, being annually 13 to 14 per cent. of the total births.

Agriculture.—Of the total area of Bavaria close upon 67 per cent. is arable and garden land, and of this again one-fourth is meadow land. Since about the middle of the 19th century con-

siderable attention has been given to the drainage of the bogs and moors of the upper districts of Bavaria. Since 1895 three experimental stations have been established for continuing the work of reclamation, but there still remain over 366,000 acres of unreclaimed bog. The farms in Bavaria, of which there were in all 663,785 in 1895, are mostly small:—23·6 per cent., or 156,971, were each less than 2½ acres; 56·1 per cent., or 372,683, were each between 2½ and 25 acres; 20 per cent., or 133,510, between 25 and 250 acres; and 621 over 250 acres. The total number of persons employed in agricultural operations exceeded 1,437,000, or approximately 25 per cent. of the population. Hay is a long way the most important crop in respect of area and bulk of produce. Next come potatoes; then follow oats, rye, barley, and wheat. But in respect of value, and economic and social importance, the wine, hops, and tobacco crops count amongst the most valuable in the kingdom. In 1899 some 51,000 acres were planted with vines, and the yield was 17,552,000 gallons of wine, valued at £1,360,000. Between 60,000 and 70,000 acres are planted with hops annually; in 1899 the yield was about 11,000 tons, equivalent to nearly one-half of the entire yield of hops in all Germany. Of this amount 35 to 40 per cent. is used in the Bavarian breweries, the rest being exported. The chief hop markets of Southern Germany are Nuremberg and Bamberg. The barley grown is very largely used for malting. Tobacco cultivation is decreasing: from 9500 acres planted in 1890 the area decreased to 4800 acres in 1899. Brewing, although carried on by several gigantic firms in Munich, Erlangen, and other large towns, is also to a very considerable extent a purely agricultural business. For instance, out of over 12,500 breweries in the country in 1898, some 5800 were in the hands of farmers. In 1897, 378,421,400 gallons of beer were brewed, and of these 56,823,300 gallons were exported, leaving a consumption per head of the population (estimated at 5,932,077 in 1897) of 53½ gallons annually. In 1898-99 the 6405 distilleries produced 3,502,620 gallons of pure alcohol. The live stock consisted in 1897 of 3,419,421 cattle, 1,412,579 pigs, 905,916 sheep, and 376,557 horses. Considerable attention is paid to the breeding of cattle, and their numbers have increased by upwards of 233,400 since 1863. On the other hand, the number of sheep decreased by more than 50 per cent. between 1863 and 1897, having in the former year numbered 2,058,688. Pigs, again, have increased from 926,522 in 1863 to the figure quoted above, an increase of 65½ per cent. The State encourages the breeding of horses by the maintenance of stud-stock farms at Augsburg, Landshut, Zweibrücken, and Erding.

Mining and Industry.—In 1897 the mines yielded 1,007,403 tons of coal, valued at £481,850; 41,098 tons of lignite, valued at £5200; and 175,305 tons of iron ore, valued at £36,350, or, in all, 1,223,808 tons of minerals of the value of £523,400. One of the chief sources of graphite in Germany are mines near Passau in Bavaria. This kingdom also exports over 6000 tons of lithographic stones (from Solnhofen, &c.) annually. The salt works and furnaces produced 41,533 tons of salt, valued at £77,600; 83,556 tons of iron, valued at £194,750; and 7041 tons of sulphuric acid, valued at £12,750. The foundries, forges, &c., turned out steel, iron wire, bars, &c., to the weight of 251,989 tons and value of £1,695,600. About 20,000 men are employed in the forests and sawmills, of which last there are about 1400 in the kingdom. Nearly 6½ million acres are covered with forests, of which 36·3 per cent. belong to the State. The total quantity of timber used at home and exported amounts to over £4,000,000 in value per annum. In 1895 some 520,000 persons over 16 years of age were employed in industry and handicraft, and of these 90,000 were females. The chief branches of industry are cotton-spinning (especially in Swabia), linen, hemp, worsted yarn, and other textiles (Augsburg, Bayreuth, &c.), thread and twist, chemicals and aniline dyes (Palatinate), plate glass, porcelain, matches, machinery (Palatinate, Nuremberg), lead pencils (Nuremberg), steel shot, toys (Nuremberg and Furth), wine and beer, lithographic and other printing (Munich), iron foundries, &c., bells, straw hats and baskets, leather, paper, gingerbread, &c. In 1897 the sugar factories and refineries produced 46,630 tons of sugar.

Communications.—The railways extended over a length of 4150 miles in 1899, and of these 3522 miles belonged to the State. The total cost of the State lines up to the end of the year 1897 amounted to £57,915,760. The profits from the railways formed the largest item in the public revenue in 1899, namely, £7,184,784, as also the heaviest item in the public expenditure, namely, £4,956,093, the net profit being thus £2,228,641.

Finances.—For each of the years 1900 and 1901 the public revenue and expenditure were balanced at £21,646,000, the principal sources of revenue being the railways, customs, and indirect taxes. In 1900 the public debt amounted to £72,931,800, of which over 75 per cent. was incurred for railways. The contribution to the imperial exchequer was fixed at £2,959,650 for each of the years 1900 and 1901.

Army.—The peace footing of the Bavarian army in 1899-1900 numbered 66,356 officers and men. A third army corps was raised in 1900. (J. T. B.)

Bay City, capital of Bay county, Michigan, U.S.A., situated in 43° 36' N. lat. and 83° 53' W. long., in the eastern part of the state, on the east bank of Saginaw river, 4 miles from its mouth and at the head of navigation, at an altitude of 592 feet. It has four railways, the Detroit and Mackinaw, the Flint and Pere Marquette, the Grand Trunk, and the Michigan Central. Besides these facilities, it has large commerce on the lakes. It is a manufacturing city of prominence, its leading industries being lumber and salt. It contains many lumber, shingle, and planing mills. Salt is made by evaporating the water of salt springs, the waste from lumber mills being used as fuel. Population (1880), 20,693; (1900), 27,628. The death-rate in 1900 was only 12·7.

Bayamo, an old interior city on the north slope of the Sierra Maestro in Santiago province, Cuba. It was the second of the seven cities of Cuba established by Diego Velasquez, and has been conspicuous in all the wars. It was in 1512 the site of the first Spanish battle in the war in which the Indians were reduced. During the ten years' insurrection it was the scene of a desperate conflict between the Spaniards and Cubans. In the insurrection which resulted in independence, Bayamo was nearly destroyed by the opposing parties. Population, 3022.

Bayard, Thomas Francis (1828-1898), American diplomatist, was born in Wilmington, Delaware, on 29th October 1828, and died on 28th September 1898, in Dedham, Massachusetts. His great-grandfather, Governor Bassett; his grandfather, James Asheton Bayard; his uncle, Richard H. Bayard; and his father, James A. Bayard, all represented Delaware in the United States Senate. Intending to go into business, he did not receive a college education; but in 1848 he decided to study law, and was admitted to the bar in 1851. Except from 1855-57, when he was a partner of William Shippen in Philadelphia, he practised chiefly in Wilmington. He was a senator from Delaware from 1869 to 1885. His abilities made him leader of the Democrats in the Senate, and his views on financial and legal questions gave him a permanent reputation for statesmanship. He was member of the Electoral Commission appointed to decide the dispute as to whether Hayes or Tilden had been elected President of the United States. In the Democratic national conventions of 1872, 1876, 1880, and 1884 he received votes for nomination as the party candidate for the Presidency. He was secretary of state, 1885-89, and pursued a conservative policy in foreign affairs. When ambassador to England, 1893-97, he became exceedingly popular, his tall dignified person, unflinching courtesy, and polished, if somewhat deliberate, eloquence making him a man of mark in all the best circles. He was considered by many Americans to have become too partial to English ways; and, for the expression of some criticisms regarded as unfavourable to his own countrymen, the House of Representatives went so far as to pass a vote of censure on him. The value of Mr Bayard's diplomacy was, however, fully recognized in the United Kingdom, where he worthily upheld the traditions of a famous line of American ministers.

Baybay, a town of 17,000 inhabitants, in the Philippine Islands, near the centre of the western coast of Leyte, of which it is one of the important ports. It exports hemp in large quantities. Other products are sulphur, wax, brea, sugar, coffee, cacao, cattle, and horses. The language is Visayan.

Bayezid, a border fortress of Asiatic Turkey, chief town of a sanjak of the Erzerum vilâyet, situated on a tributary of the Aras, on the site of the old Armenian

town Pakovan. In the Russo-Turkish war of 1877-78, it was taken by the Russians, but was restored to Turkey by the Treaty of Berlin. During the war the Christians were massacred, and the town has since lost any commercial importance it once possessed.

Baynes, Thomas Spencer (1823-1887), English editor and man of letters, was born at Wellington, Somerset, 24th March 1823, and was the son of the minister of the Baptist congregation there. He graduated at the University of London, but received his most important instruction at Edinburgh University under Sir William Hamilton, whom he assisted in the conduct of his class, and of whose views on logic he became the authorized exponent. He was assistant editor of the *Daily News* from 1858 to 1864, when he was appointed professor of logic, metaphysics, and English literature at the University of St Andrews. In 1873 he undertook the editorship of the ninth edition of the *Encyclopædia Britannica*, and conducted it singly until 1880, when the decline of his health rendered it necessary to provide him with a coadjutor in the person of Professor W. Robertson Smith. Baynes, however, continued to be engaged upon the work until his death on 31st May 1887, shortly before its completion. His remarkable article on Shakespeare was republished in 1894, along with other essays on Shakespearian topics and a memoir by Professor Lewis Campbell. He was a man of great and versatile ability, and made valuable contributions to the subjects of logic, grammar, politics, and general literature, which occupied his attention by turns. (R. G.)

Bayonet.—The first known mention of the bayonet occurs in the *Memoirs* of the elder Puységur, published posthumously in Paris, 1747. He says that when commanding the troops at Ypres in 1647 his musketeers used bayonets consisting of a steel dagger fixed in a wooden haft, which fitted into the muzzle of the musket—in fact, plug-bayonets. Courts-martial were held on some English soldiers at Tangier in 1663-64 for using their daggers on their comrades. As bayonets were at first called daggers, and as there were few or no pikemen in Tangier until 1675, the probable conclusion is that the troops in Tangier used plug-bayonets. In 1671 plug-bayonets were issued to the French regiment of fusiliers then raised. They were issued to part of an English dragoon regiment raised in 1672 and disbanded in 1674, and to the Royal Fusiliers when raised in 1685. The danger incurred by the use of this bayonet (which put a stop to all fire) was felt so early that the younger Puységur saw a ring-bayonet in 1678 which could be fixed without stopping the fire. The English defeat at Killiecrankie in 1689 was due (among other things) to the plug-bayonet; and shortly afterwards the defeated leader, General Mackay, introduced a ring-bayonet of his own invention. A trial with badly-fitting socket or zigzag-bayonets was made after the battle of Fleurus, 1690, in the presence of Louis XIV., who refused to adopt them. Shortly after the peace of Ryswick was signed, 20th September 1697, the English and Germans abolished the pike and introduced these bayonets, and plates of them are given in Surirey de St Remy's *Mémoires d'Artillerie*, published in Paris in that year; but owing to a military cabal they were not issued to the French infantry until 1703. This bayonet remained in the British service until 1805, when the present spring-bayonet was introduced by Sir John Moore.

Bayonne, chief town of arrondissement in the department of Basses-Pyrénées, France, 66 miles W.N.W. of Pau, on the railway to Bordeaux and Toulouse. Great improvements have been effected, and the port now extends

inwards to the confluence of the Nive with the Adour, forming an outer and an inner harbour, with areas respectively of 143 and 274 acres, having a total length of quayage of 8758 feet, and a depth at entrance (spring tides) of 19 feet. Including coasting trade, in 1899, 845 vessels of 307,937 tons entered, and 853 of 310,354 tons cleared; of which British vessels numbered 108 entered of 82,387 tons, and 106 cleared of 81,919 tons. Imports were valued at £600,000 and exports at £580,000 in 1899. The port is an entrepôt for colonial produce and Spanish wool. The foreign trade is chiefly with Spain and England. The cathedral, begun in the 13th century, was completed in 1875. The *Allées Marines*, a series of fine promenades bordering the Adour for $1\frac{1}{2}$ miles, form a special feature of the town. The legend which derives the word *bayonet* from the name of this town is supported by no sufficient evidence. Population (1881), 18,468; (1896), 22,278; (1901), 27,601.

Bayonne, a city of Hudson county, New Jersey, U.S.A., occupying the peninsula between New York harbour and Newark Bay, immediately south of Jersey city. It is traversed by the Central Railway of New Jersey, and has large petroleum refineries and chemical works. Population (1885), 13,080; (1890), 19,033; (1900), 32,722. The death-rate in 1900 was 16·7.

Bayreuth, or BAIREUTH, a town of Bavaria, Germany, district Upper Franconia, 58 miles by rail N.N.E. from Nuremberg. The town is best known in recent years for the performances of Wagner's operas, which are performed in a theatre (1876) exclusively constructed for the purpose, and situated outside the town on the north. In the town is Wagner's house, with his grave in the garden. Franz Liszt (1811-86) is buried here, as well as Richter. Amongst the institutions of the town should also be mentioned the palace of Duke Alexander of Würtemberg, the administrative offices, the statue of King Maximilian II. (1860), a lunatic asylum, an agricultural school, an art society, the collections of the historical society, a convict prison, and a military hospital. Population (1885), 23,559; (1895), 27,693.

The Wagner Theatre.—As the centre of the Wagnerian *cultus*, Bayreuth has assumed an importance altogether new. Among the many advantages which Wagner gained from his intimacy with Ludwig II., king of Bavaria, not the least was the practical support given to his plan of erecting a theatre for the ideal performance of his own music-dramas. The first plan, of building a new theatre for the purpose in Munich itself, was rejected, because Wagner rightly felt that the appeal of his advanced works, like the *Nibelungen* trilogy, would be far stronger if the comparatively small number of people who wished to hear them were removed from the distractions of a large capital; Bayreuth possessed the desired seclusion, being on a line of railway that could not be approached from any quarter without changing. The municipality furthered Wagner's scheme in every way, and in May 1872 the foundation stone of the Festspielhaus was laid, the event being commemorated by a notable performance of Beethoven's Choral Symphony in the old opera house. The funds for the erection of the theatre were raised in part by the issue of 1000 certificates of patronage ("Patronatsscheine"), but the bulk of the sum was raised by founding "Wagner Societies" from St Petersburg to Cairo, from London to New York; these societies sprang up with such success that the theatre was opened in the summer of 1876 with the first complete performance of "*Der Ring des Nibelungen*." The theatre, which stands on a height a little under a mile from the town, is built from the plans of Gustav Semper, the idea of the design being Wagner's own, an experiment indeed,

but one which succeeded beyond all expectation. Though external ornamentation was cut down to almost nothing, space was more generously granted, and the number of entrances would be ample for an audience of twice the size that can be accommodated; for 1750 seats are all that are available for the public. These are arranged on a kind of sloping wedge, in such a manner that every one has an almost equally good view of the stage, for there are no boxes, and the only galleries are quite at the back, one, the "*Fürstenloge*," being reserved for distinguished guests, the other, above it, for the townspeople. Immediately in front of the foremost row of seats a hood, or sloping screen of wood, covers a part of the orchestra, and another hood of similar shape starts from the front of the stage at a slightly lower level. Thus there is left a space between the two hoods through which the sound of the orchestra ascends with wonderfully blended effect; the conductor, sitting at the highest point of the orchestra, though under the screen, has a complete view of the stage as well as of his instrumentalists, and the sound of the orchestra is sent most forcibly in the direction of the stage, so that the voices are always well supported. The stage itself has every modern appliance in the way of scenic device and machinery, the illusion presented in each picture being perfect. The pictorial effect, and the wonderful system of lighting, are greatly enhanced by the distance between the front of the stage and the foremost spectator, as well as by the disposition of all the spectators on the same plane, so that the scene has the same effect of perspective, &c. to every one in the audience. After the first set of performances, which were conducted by Hans Richter, and resulted in a loss of £7500, Wagner was compelled to allow performances of the trilogy to be given in the ordinary theatres of Germany; it was brought to England in 1882, the year which saw the production of the crowning work of Bayreuth, and Wagner's masterpiece, "*Parsifal*," on 28th July. In this great work the master's practical knowledge of the splendid acoustic properties of his theatre, and of its scenic possibilities, enabled him to create effects which could never be realized in the ordinary theatre, even if the character of the subject rendered it suitable for performance in the usual rotation with other operas. For Bayreuth and all that it means, this performance was of the greatest possible value; the impossibility of the work being given elsewhere, unless other theatres on a similar principle should be built for its reception in the future, gradually attracted a larger and larger number of spectators, and though from time to time at subsequent festivals the other works of Wagner have been produced, yet "*Parsifal*" has very seldom been out of the scheme.

As an important addition to the work of the theatre, a permanent school has been established at Bayreuth for the sake of training young musicians to take part in the festival performances, which were at first exclusively, and then partially, undertaken by artists from other German and foreign theatres. The special feature upon which most stress has been laid, ever since Wagner's death in 1883, has been not so much the musical as the dramatic significance of the works; it is contended by the inmost circle of Wagnerian adherents that none but they can fully realize the master's intentions or hand down his traditions. What is called the "*Bayreuth Idea*" is set forth in much detail from this point of view by Mr Houston Stewart Chamberlain, in his *Richard Wagner* (1897 and 1900). (J. A. F. M.)

Bazaine, François Achille (1811-1888), marshal of France and senator of the Empire, was born at Versailles, on 13th February 1811. He entered the army as a private soldier in 1831, and received a commission as sub-lieutenant in 1832. By his gallantry in Algeria he won the Cross of the Legion of Honour and was promoted lieutenant. He served two campaigns with the Foreign Legion against the Carlists in Spain in 1837-38,

returning to Africa as captain in 1839. During the succeeding decade he saw much active service in Africa, and rose to be a brigadier-general with the charge of the district of Tlemcen. In the Crimean war he commanded a brigade and maintained his reputation in the trenches before Sebastopol. On the capture of the south side he was appointed governor of the place, and was promoted general of division. He commanded the French forces in the expedition to Kinburn (commander, Legion of Honour). In Lombardy in 1859 he was wounded when in command of the third division of the first corps in the attack upon Melegnano, and took a conspicuous part in the battle of Solferino (grand cross, Legion of Honour). He commanded the first division under Marshal Forey in the Mexican expedition in 1862, succeeded him in supreme command in 1863, and became a marshal and senator of France in the following year. He at first pursued the war with great vigour and success, entering Mexico in 1863, and driving President Juarez to the frontier. He organized a system of guerilla warfare which was carried out with barbarity. He married a rich Mexican lady, whose family were supporters of Juarez, and it was alleged that he was not true to the Emperor Maximilian. At any rate there were grave differences, and finally the French forces were withdrawn. The retreat and embarkation at Vera Cruz were skilfully conducted by Bazaine in 1867. On his return to Paris he was appointed to the command of the third army corps at Nancy, and in 1869 commander-in-chief of the imperial guard at Paris. In the Franco-German war he commanded the army of the Rhine, and, after the sanguinary battles round Metz, was shut up in that fortress with an army of 170,000 men, which surrendered in October 1870. On his return to France he was tried by court-martial, found guilty of negotiating with and capitulating to the enemy before doing all that was prescribed by duty and honour, and sentenced to degradation and death, but recommended to mercy. His sentence was commuted to twenty years' seclusion, and the humiliating ceremonies attending degradation were dispensed with. He was incarcerated in the Île Sainte Marguerite, whence he escaped in 1874 to Italy. He finally took up his abode in Madrid, where he died on the 23rd of September 1888. He published an account of his share in the war and a justification of his conduct. He also wrote *L'Armée du Rhin*, describing its operations to the date of the surrender of Metz.

(R. H. V.)

Bazalgette, Sir Joseph William (1819-1891), English engineer, was born at Enfield on 28th March 1819. At the age of seventeen he was articled as pupil to an engineer, and a few years later he began to practise successfully on his own account. His name is best known for the engineering works he carried out in London, especially for the construction of the main drainage system and the Thames embankment. In 1848 the control of London drainage, which had hitherto been divided among eight distinct municipal bodies, was consolidated under twelve commissioners, who were in 1849 superseded by a second commission. Under the latter Bazalgette accepted an appointment which he continued to hold under the three successive commissions which in the course of a year or two followed the second one, and when finally in 1855 these fleeting and ineffective bodies were replaced by the Metropolitan Board of Works, he was at once appointed its chief engineer. His plans were ready, but the work was delayed by official obstruction and formality until 1858. Once begun, however, it was vigorously pushed on, and in 1865 the Prince of Wales was able formally to open the system, which consisted of 83 miles of large intercepting sewers, draining more

than 100 square miles of buildings, and calculated to deal with 420 million gallons a day. The cost was £4,600,000. Almost simultaneously Bazalgette was engaged on the plans for the Thames embankment. The section between Westminster and Vauxhall on the Surrey side was built between 1860 and 1869, and the length between Westminster and Blackfriars was declared open by the Prince of Wales in 1870. The Chelsea embankment followed in 1871-74, and in 1876 Northumberland Avenue was formed. The total outlay on the scheme exceeded two millions sterling. Bazalgette was also responsible for various other engineering works in the metropolitan area, designing, for example, new bridges at Putney and Battersea and the steam ferry between North and South Woolwich. He also prepared plans for a bridge over the river near the Tower and for a tunnel under it at Blackwall, but did not live to see either of these projects carried out. He died on 15th March 1891 at Wimbledon.

Bazeilles, a town in the arrondissement of Sedan, department of Ardennes, France, $2\frac{1}{2}$ miles S.E. of Sedan. The town was the scene of one of the earliest conflicts in the war of 1870. After a most sanguinary struggle during two days, Aug. 31-Sept. 1, it was taken by the Prussians and given up to the flames; it was subsequently rebuilt by national subscription. Population (1896), 1276; (1901), 1406.

Beaconsfield, Benjamin Disraeli, EARL OF (1804-1881), British statesman, second child and eldest son of Isaac Disraeli and Maria Basevi, who were married in 1802, was born at No. 6 John Street, Bedford Row, on the 21st of December 1804. Of Isaac Disraeli's other children, Sarah was born in 1802, Naphtali in 1807, Ralph (Raphael) in 1809, and James (Jacob) in 1813. None of the family was akin to Benjamin for genius and character, except Sarah, to whom he was deeply indebted for a wise, unswerving, and sympathetic devotion, when, in his earlier days, he needed it most. All Isaac Disraeli's children were born into the Jewish communion, in which, however, they were not to grow up. It is a reasonable inference from Isaac's temperament, character, and history, that he was never at ease in the ritual of Judaism. He was in troubled relations with his synagogue for some years before the death of his father, whom he was naturally unwilling to hurt or offend by declared secession. His father died in the winter of 1816. Soon afterwards Isaac formally withdrew with all his household from the Jewish church. His son Benjamin, who had been admitted to it with the usual rites eight days after his birth, was baptized at St Andrew's Church in Holborn on the 31st of July 1817. One of Isaac Disraeli's reasons for quitting the tents of his people was that rabbinical Judaism, with its unyielding laws and fettering ceremonies, "cuts off the Jews from the great family of mankind." Little did he know, when therefore he cut off the Disraeli family from Judaism, what great things he was doing for one small member of it. The future prime minister was then short of thirteen years old, and there was yet time to provide the utmost freedom which his birth allowed for the faculties and ambitions he was born with. Taking the worldly view alone, of course, most fortunate for his aspirations in youth was his withdrawal from Judaism in childhood. That it was fully sanctioned by his intellect at maturity is evident; but the vindication of unbiassed choice would not have been readily accepted had Disraeli abandoned Judaism of his own will at the pushing *Vivian Grey* period or after. And though a mind like Disraeli's might work to satisfaction with Christianity as "completed Judaism," it could but dwell on a breach of continuity which means so much to Jews and which he was never

allowed to forget amongst Christians. With all, he was proud of his race as truly, if not as vehemently, as his paternal grandmother detested it. Family pride contributed to the feeling in his case; for in his more speculative moods he could look back upon an ancestry which was of those, perhaps, who colonized the shores of the Mediterranean from before the time of the Captivity. More definite is the history of descent from an ennobled Spanish family which escaped from the Torquemada persecutions to Venice, there found a new home, took a new name, and prospered for six generations. The Benjamin Disraeli, Lord Beaconsfield's grandfather, who came to England in 1748, was a younger son sent at eighteen to try his fortune in London. "A man of ardent character, sanguine, courageous, speculative, fortunate, with a temper which no disappointment could disturb"

LORD BEACONSFIELD.

(From a photograph by Hughes and Mullins, Ryde, I.W.)

(so Lord Beaconsfield described him), he soon made the beginnings of a handsome fortune and turned country gentleman. That his grandson exaggerated his prosperity is highly probable; but that he became a man of wealth and consideration is certain. He married twice. His second wife was Sarah Siprout de Gabay, "a beautiful woman of strong intellect" and importunate ambitions, who hated the race she belonged to because it was despised by others. She felt so keenly the social disabilities it brought upon her, and her husband's indifference to them, that "she never pardoned him his name." Her literary son Isaac suffered equally or even more; for though he had ambitions he had none that she could recognize as such. She could ridicule him for the aspirations which he had not and for those which he had; on the other hand, he never heard from her a tender word "though she lived to be eighty." Nor did any other member of her family, according to her grandson.

Isaac Disraeli was devoted to the reading and writing of books in domestic quiet; and his son Benjamin suffered

appreciably from his father's gentle preoccupations. As a child—unruly and disturbing no doubt—he was sent to a school of small account at Blackheath, and was there "for years" before he was recalled at the age of twelve on the death of his grandfather. Isaac Disraeli was his father's sole heritor, but change of fortune seems to have awakened in him no ambitions for the most hopeful of his sons. At fifteen, not before, Benjamin was sent to a Unitarian school at Walthamstow—a well-known school, populous enough to be a little world of emulation and conflict, but otherwise unfit. Not there, nor in any similar institution at that illiberal time, perhaps, was a Jewish boy likely to make a fortunate entry into "the great family of mankind." His name, the foreign look of him, and some pronounced incompatibilities not all chargeable to young Disraeli, soon raised a crop of troubles. His stay at Walthamstow was brief, his departure abrupt, and he went to school no more. With the run of his father's library, and the benefits of that born bookman's guidance, he now set out to educate himself. This he did with an industry stiffened by matchless self-confidence and by ambitions fully mature before he was eighteen. Yet he yielded to an attempt to make a man of business of him. He was barely seventeen when (in November 1821) he was taken into the office of Messrs Swain, Stevens and Co., solicitors, in Frederick's Place, Old Jewry. Here he remained for three years—"most assiduous in his attention to business," said one of the partners, "and showing great ability in the transaction of it." It was then determined that he should go to the bar; and accordingly he was entered at Lincoln's Inn in 1824. But Disraeli had found other studies and an alien use for his pen. Though "assiduous in his attention to business" in Frederick's Place, he found time to write for the printer. Dr Smiles, in his *Memoirs of John Murray*, tells of certain pamphlets on the brightening prospects of the Spanish South American colonies, then in the first enjoyment of emancipation—pamphlets seemingly written for a Mr Powles, head of a great financial firm, whose acquaintance Disraeli had made. In the same year, apparently, he wrote a novel—his first, and never published. *Aylmer Papillon* was the title of it, Dr Smiles informs us; and he prints a letter from Disraeli to the John Murray of that day, which indicates its character pretty clearly. The last chapter, its author says, is taken up with "Mr Papillon's banishment under the Alien Act, from a ministerial misconception of a metaphysical sonnet." About the same time he edited a *History of Paul Jones*, originally published in America, the preface to the English edition being Disraeli's first appearance as an author. Murray could not publish *Aylmer Papillon*, but he had great hopes of its boyish writer (Isaac Disraeli was an old friend of his), "took him into his confidence, and related to him his experiences of men and affairs." Disraeli had not completed his twenty-first year when (in 1825) Murray was possessed by the idea of bringing out a great daily newspaper; and if his young friend did not inspire that idea he keenly urged its execution, and was "The Representative." entrusted by Murray with the negotiation of all manner of preliminaries, including the attempt to bring Lockhart in as editor. The title of the paper, *The Representative*, was Disraeli's suggestion. He chose reporters, looked to the setting-up of a printing-office, busied himself in all ways to Murray's great satisfaction, and, as fully appears from Dr Smiles's account of the matter, with extraordinary address. But when these arrangements were brought to the point of completion, Disraeli dropped out of the scheme and had nothing more to do with it. He was to have had a fourth share of the proprietorship, bringing in a corresponding amount of capital. His friend

Mr Powles, whom he had enlisted for the enterprise, was to have had a similar share on the same conditions. Neither seems to have paid up, and that, perhaps, had to do with the quarrel which parted Benjamin Disraeli and John Murray before a sheet of the luckless *Representative* was printed. Many years afterwards (1853) Disraeli took an active interest in *The Press*, a weekly journal of considerable merit but meagre fortunes.

At the death of the elder Benjamin (1817), his son Isaac had moved from the King's Road, Gray's Inn (now Theobald's Road), to No. 6 Bloomsbury Square. Here he entertained the many distinguished friends, literary and political, who had been drawn to him by his "Curiosities" and other ingenious works, and here his son Benjamin also had their acquaintance and conversation. In Bloomsbury Square lived the Austens, and to their house, a great resort of similar persons, Mrs Austen cordially welcomed him. Murray's friendship and associations helped him in like manner, no doubt; and thus was opened to Disraeli the younger a world in which he was to make a considerable stir. The very much smaller society of that day was, of course, more comprehensible to sight and hearing, when once you were within its borders, than the society of this. Reverberations of the gossip of St James's and Mayfair extended to Bloomsbury in those days. Yet Disraeli's range of observation must have been not only brief but limited

when he sat down at twenty or twenty-one to write *Vivian Grey*. It is therefore a probable conjecture that Mrs Austen, a clever woman of the world, helped him from her knowledge. His own strongly perceptive imagination (the gift in which he was to excel every other politician of his time) and the bent of political reading and aspiration from boyhood completed his equipment; and so the wonder that so young a man in Disraeli's social position should write a book like *Vivian Grey* is accounted for. It was published in 1826. The success of this insolently clever novel, the immediate introduction of its author to the great world, and the daring eccentricities of dress, demeanour, and opinion by which he fixed attention on himself there, have always been among the most favourite morsels of Disraeli's history. With them it began, and successive generations of inquirers into a strange career and a character still shrouded and baffling refer to them as settled starting-points of investigation. What was the man who, in such a society and with political aspirations to serve, could thrive by such vagaries as these, or in spite of them? If unaffected, what is to be thought of them as keys to character? If affected, what then? Inquiry still takes this shape, and when any part of Disraeli's career is studied, the laces and essences, the rings over gloves, the jewelled satin shirt-fronts, the guitareries and chibouquieries of his early days are never remote from memory. The report of them can hardly be doubted; and as the last relation was made (to the writer of this article) not with intent to ridicule Mr Disraeli's taste but to illustrate his conquering abilities, the story is repeated here. One of Disraeli's first friends in the world of fashion and genius was Sir Edward Lytton Bulwer. "And," said Sir Henry Bulwer ("Pelham's" brother), "we heard so much at that time of Edward's amazingly brilliant new friend that we were the less inclined to make his acquaintance." At length, however, Sir Edward got up a little dinner-party to convince the doubters. It was to meet at the early hour of those days at one of the Piccadilly hotels. "There was my brother, Alexander Cockburn, myself, and (I think) Milnes; but for a considerable time no Mr Disraeli. Waiting for Mr Disraeli did not enhance the pleasure of meeting him, nor when he did arrive did his appearance predispose us in his favour. He wore green

velvet trousers, a canary-coloured waistcoat, low shoes, silver buckles, lace at his wrists, and his hair in ringlets." The description of the coat is forgotten. "We sat down. Not one of us was more than five-and-twenty years old. We were all—if you will allow me to include myself—on the road to distinction, all clever, all ambitious, and all with a perfect conceit of ourselves. Yet if on leaving the table we had been severally taken aside and asked which was the cleverest of the party, we should have been obliged to say 'the man in the green velvet trousers.'" This story is a little lamp that throws much light. Here we see at their sharpest the social prejudices that Disraeli had to fight against, provocation of them carried to its utmost in every way open to him, and complete conquest in a company of young men less likely to admit superiority in a wit of their own years, probably, than any other that could have been brought together at that time.

Soon after the publication of *Vivian Grey*, Disraeli, who is said by Froude to have been "overtaken by a singular disorder," marked by fits of giddiness ("once he fell into a trance, and did not recover for a week"), went with the Austens on a long summer tour in France, Switzerland, and Italy. Returning to a quiet life at Bradenham—an old manor-house near High Wycombe, which his father had taken—Disraeli put law in abeyance and resumed novel-writing. His weakest book, and two or three other productions, brief, but in every literary sense the finest of his works, were written in the next two or three years. But for *Ixion in Heaven*, *The Infernal Marriage*, and *Popanilla*, Disraeli could not be placed among the greater writers of his kind; yet none of his imaginative books have been so little read as these. The mysterious malady continued, and Disraeli set out with William Meredith, who was to have married Sarah Disraeli, for a tour in southern Europe and the nearer East. He saw Cadiz, Seville, Granada, Athens, Constantinople, Jerusalem, Cairo, Thebes; played the corsair with James Clay on a yacht voyage from Malta to Corfu; visited the terrible Reschid, then with a Turkish army in the Albanian capital; landed in Cyprus, and left it with an expectation in his singularly prescient mind that the island would one day be English. These travels must have profited him greatly, and we have our share of the advantage; not so much, however, in *The Wondrous Tale of Alroy* or *Tancred*, or the "Revolutionary Epic" which he was inspired to write on "the windy plains of Troy," but in the letters he sent home to his sister. These letters, written with the utmost freedom and fulness to the one whose affection and intellect he trusted more than any, are of the greatest value for interpreting the writer. Together with other letters also published some time after Disraeli's death, they tell more of him than anything that can be found in print elsewhere. They show, for example, that his extraordinary exuberances were unforced, leaping by natural impulse from an overcharged source. They also show that his Oriental fopperies were not so much "purposed affectation" as Froude and others have surmised. That they were so in great part is confessed again and again in these letters, but confessed in such a way as to reveal that they were permitted for his own enjoyment of them as much as planned. The "purposed affectation" sprang from an unaffected delight in gauds of attire, gauds of fancy and expression. It was not only to startle and impress the world that he paraded his eccentricities of splendour. His family also had to be impressed by them. It was to his sober father that he wrote, at the age of twenty-six: "I like a sailor's life from Gibraltair to the same hand that we read of his two canes—a morning and an evening cane"—changed as the gun fires. And

the same correspondent must be told that "Ralph's handkerchief which he brought me from Paris is the most successful thing I ever wore."

When Disraeli returned to England in 1831, all thought of the law was abandoned. The pen of romance was again taken up—the poet's also and the politician's.

Literary production.

In the next five years he wrote *Contarini Fleming*, the *Revolutionary Epick*, *Alroy*, *Henrietta Temple*, *What is He?* (a pamphlet expository of his opinions), the *Runnymede Letters*, a *Vindication of the British Constitution*, and other matter of less note. The epic, begun in great hope and confidence, was ended in less, though its author was to the last unwilling that it should be forgotten. The novels revived the success he had with *Vivian Grey*, and restored him to his place among the brilliancies and powers of the time. The political writing, too, much of it in a garish, extravagant style, exercised his deeper ambitions, and stands as witness to the working of original thought and foresight. Both qualities are conspicuous in *What is He?* and the *Vindication*, of which it has been truly said that in these pages he "struck the keynote to the explanations he afterwards consistently offered of all his apparent inconsistencies." Here an interpretation of Tory principles as capable of running with the democratic idea, and as called upon to do so, is ingeniously attempted. The aristocratic principle of government having been destroyed by the Reform Bill, and the House of Lords being practically "abrogated" by that measure, it became necessary that Toryism should start from the democratic basis, from which it had never been alien. The filched liberties of the Crown and the people should be restored, and the nation redeemed from the oligarchies which had stolen from both. When at the beginning of all this writing Disraeli entered the political arena as candidate for High Wycombe (1832), he was nominated by a Tory and seconded by a Radical—in vain; and vain were two subsequent attempts in the autumn of 1832 and in 1834. In the first he was recommended to the electors by Daniel O'Connell and the Radical Hume. In his last candidature at Wycombe he stood on more independent ground, commending himself by a series of speeches which fully displayed his quality, though the prescience which gemmed them with more than one prophetic passage was veiled from his contemporaries. Among Disraeli's great acquaintances were many—Lyndhurst at their head—whose expectations of his future were confirmed by the Wycombe speeches. He was "thought of" for various boroughs, Marylebone among the number, but his democratic Toryism seems to have stood in his way in some places and his inborn dislike of Radicalism in others. It was an impracticable situation—no getting on from it; and so, at Lyndhurst's persuasion, as he afterwards acknowledged, he determined to side with the Tories. Accordingly, when in the spring of 1835 a vacancy occurred at Taunton, Disraeli contested the seat in the Tory interest with Carlton Club support. Here again he failed, but with enhanced reputation as a fighting politician and with other consequences good for notoriety. It was at Taunton that Disraeli fell upon O'Connell, rather ungratefully; whereupon the Liberator was roused to retort on his assailant vehemently as "a liar," and humorously as a probable descendant of the impenitent thief. And then followed the challenge which, when O'Connell declined it, was fastened on his son Morgan, and the interruption of the duel by seizure of Mr Disraeli in his bed, and his famous appearance in the Marylebone police court. He declared himself very well satisfied with this episode, but nothing in it can really have pleased him, not even the noise it made.

Here the first period of Disraeli's public life came to an

end, a period of preliminaries and flourishes, and of what he himself called sowing his political wild oats. It was a more mature Disraeli who in the general election of 1837 was returned for Maidstone as the colleague of his providential friend Mr Wyndham Lewis. Though the fortunes of the Tory party were fast reviving under Peel's guidance, the victory was denied him on this occasion; but, for once, the return of the Whigs to power was no great disappointment for the junior member for Maidstone. To gain a footing in the House of Commons was all that his confident spirit ever asked, and Froude vouches for it that he succeeded only just in time to avert financial ruin. His electioneering ventures, the friendly backing of bills, and his own expense in keeping up appearances, had loaded him with debt. Yet (mark his worldly wisdom) "he had never entangled his friends in his financial dealings. He had gone frankly to the professional money-lenders, who made advances to him in a speculation on his success": they were to get their money back with large interest or lose it altogether. Such conditions were themselves incitement enough to a prompt redemption of the promise of parliamentary distinction, even without the restless spurring of ambition. And Disraeli had another promise to redeem: that which he uttered when he told O'Connell that they would meet again at Philippi. Therefore when, three weeks after the session began, a debate on Irish election petitions gave him opportunity, Disraeli attempted that first House of Commons speech which imagination still dwells upon as something wondrous strange. That he should not have known better, even by hearsay, than to address the House of Commons in fantastic phrase from the mouth of a fantastic figure is indeed remarkable, but not that he retained self-confidence enough to tell the unwitting crew who laughed him down that a time would come when they would hear him. It was one of the least memorable of his prophecies. The speech was a humiliating but not an oppressive failure. In about a week afterwards he spoke again, which shows how little damage he felt, while the good sense, brevity, and blameless manner of the speech (on a Copyright Bill) announced that he could learn. And for some time thereafter he affected no importance in the House, though not as withdrawing from attention.

Meanwhile, consciously and unconsciously, as is the way with men of genius, his mind was working upon problems of government, the magnitude, the relations, and the natural developments of which he was more sensible of than any known politician of his time. "Sensible of," we say, to mark the difference between one sort of understanding and another which comes of labour and pains alone. Disraeli studied too, no doubt, reading and inquiring and applying set thought, but such means were insufficient to put into his mind all that he found there. It seems that opinions may be formed of inquiry and study alone, which are then constructive; but where intuitive perception or the perceptive imagination is a robust possession, the fruits of research become assimilative—the food of a divining faculty which needs more or less of it according to the power of divination. The better judgment in all affairs derives from this quality, which has some very covetable advantages for its possessor. His judgments may be held with greater confidence, which is an intellectual advantage; and, standing in his mind not so much an edifice as a natural growth, they cannot be so readily abandoned at the call of ease or self-interest. They may be denied assertion or even outraged for a purpose, but they cannot be got rid of,—which is a moral advantage. Disraeli's mind and its judgments were of this character. Its greatest gift was not the romantic

Enters Parliament.

Mental characteristics.

imagination which he possessed abundantly and employed overmuch, but the perceptive, interpretive, judicial or divining imagination, without which there can be no great man of affairs. Breadth of view, insight, foresight, are more familiar but less adequate descriptions of a faculty which Disraeli had in such force that it took command of him from first to last. Although he knew and acted on the principle that "a statesman is a practical character," whose business is to "serve the country according to its present necessities," he was unable to confine his vision to the nearer consequences of whatever policy, or course of action, or group of conditions it rested on. Without effort, and even without intention probably, it looked beyond first consequences to the farther or the final outcome; and to complete the operation, the faculty which detected the remoter consequences did not allow them to remain in obscurity, but brought them out as actualities no less than the first and perhaps far more important than the first. Moreover, it did not allow him to keep silence where the remoter consequences were of that character, and ought to be provided for betimes. Of course silence was always possible. These renderings to foresight might be denied assertion either for the sake of present ease (and Disraeli's prescience of much of his country's later troubles only made him laughed at) or in deference to hopes of personal advancement. But the same divining imagination which showed him these things also showed him the near time when it would be too late to speak of them, and when not to have spoken would leave him irredeemably in the common herd of hand-to-mouth politicians. Therefore he spoke.

Remembrance of these characteristics—remembrance, too, that his mind, which was neither English nor European, worked in absolute detachment—should accompany the traveller through all the turns and incidents of Disraeli's long career. They are sometimes puzzling, often speculative; yet nearly all that is obscure in them becomes clear, much apparent contradiction disappears, when read by these persistent unvarying lights. The command which his idiosyncrasies had upon him is shown, for example, by reproachful speeches on the treatment of Ireland, and by a startling harangue on behalf of the Chartists, at a time when such irregularities could but damage him, a new man, where he hoped for influence and office. At about the same time his political genius directed him to open a resolute critical campaign against the Conservatism of the party he proposed to thrive in, and he could but obey. This he did in writing

"*Coningsby*," a novel of the day and for the day, but commended to us of a later generation not only by the undimmed truth of its character-portraits, but by qualities of insight and foresight which we who have seen the proof of them can measure as his contemporaries could not. *Sybil*, which was written in the following year (1845), is still more remarkable for the faculties celebrated in the preceding paragraph. When *Sybil* was written a long historic day was ending in England, a new era beginning; and no eyes saw so clearly as Disraeli's the death of the old day, the birth of the new, or what and how great their differences would be. In *Coningsby* the political conditions of the country were illustrated and discussed from the constitutional point of view, and by light of the theory that for generations before the passing of the Reform Bill the authority of the Crown and the liberties of the people had been absorbed and extinguished in an oligarchic system of government, itself become fossilized and soulless. In *Sybil* were exhibited the social relations of rich and poor (the "two nations") under this régime, and under changes in which, while the peasantry were neglected by a shoddy

aristocracy ignorant of its duties, factory life and a purblind gospel of political economy embruted the rest of the population. These views were enforced by a startling yet strictly accurate representation of the state of things in the factory districts at that time. Taken from the life by Disraeli himself, accompanied by one or two members of the Young England party of which he was the head, it was the first of its kind; and the facts as there displayed, and Disraeli's interpretation of them—a marvel of perceptive and prophetic criticism—opened eyes, roused consciences, and led direct to many reforms.

These two books, the *Vindication*, published in 1835, and his speeches up to this time and a little beyond, are quite enough to show what Disraeli's Tory democracy meant, how truly national was its aim, and how exclusive of partisanship for the "landed interest"; though he did believe the stability and prosperity of the agricultural class a national interest of the first order, not on economic grounds alone or even chiefly. And if Disraeli, possessed by these views, became aggressively insubordinate some time before Peel's proclaimed conversion to Free Trade, we can account for it on reasonable and even creditable grounds. Spite, resentment at being passed over when Peel formed the 1841 Government, is one explanation of these outbreaks, and a letter to Peel, lately published, is proof to many minds that Disraeli's denial to Peel's face in 1846 that he had ever solicited office was daringly mendacious. The letter certainly reads like solicitation in the customary half-veiled form. All that can be said in doubt is that since the '41 Government came into existence on the 6th of September, and the letter was written on the 5th, its interpretation as complaint of being publicly neglected, as a craving for some mark of recognition, is possible. More than possible it is if Disraeli knew on the 5th (as he very well might from his friend Lyndhurst, Peel's lord chancellor) that the appointments were then complete. The pecuniary need of office, if that comes into the question, had been lightened, if not extinguished, two years before by his marriage with Mrs Wyndham Lewis. Mrs Lewis—a lady fifteen years his senior—brought him a considerable fortune, which, however, was but for her life. She lived to a great age, and would gladly have lived longer, in any of the afflictions that time brings on, to continue her mere money-worth to her "Dizzy." Her devotion to him, and his devotion to her, is the whole known story of their private life; and we may believe that nothing ever gratified him more than offering her a coronet from Mr Disraeli.

Disraeli made Peel's acquaintance early in his career and showed that he was proud of it. In his *Life of Lord George Bentinck* he writes of Peel fairly and even generously. But they were essentially antipathetic persons; and it is clear that the great minister and complete Briton took no pains to understand the dazzling young Jew of whom Lyndhurst thought so much, and wished to have little to do with him. Such men make such feelings evident; and there is no reason for thinking that when, after 1841, Disraeli charged at Peel in obedience to his principles he gave himself pain. It was not long after it had settled in office that Peel's Government, the creature of an anxious Conservative reaction, began to be suspected of drifting toward Manchester. That it was forced in that direction we should say rather, looking back, for it was a time of dire distress, especially in the manufacturing districts of the north; so that in his second session Peel had to provide some relief by revising the corn laws and reducing import dues generally. His measures were supported by Disraeli, who understood that Protection must bend to the menacing poverty of the time, though unprepared for

Politics,

total abolition of the corn tax and strongly of opinion that it was not for Peel to abolish it. In the next session (1843) he and his Young England party took up a definitely independent rôle, which became more sharply critical to the end. Disraeli's first strong vote of hostility was on a Coercion Bill for perishing and rebellious Ireland. It was repeated with greater emphasis in the session of 1844, also in a Condition-of-Ireland debate; and from that time forth, as if foreseeing Peel's course and its effect on the country party, Disraeli kept up the attack. Meanwhile bad harvests deepened the country's distress, Ireland was approached by famine, the Anti-Corn-Law League became menacingly powerful, and Peel showed signs of yielding to Free Trade. Disraeli's opportunity was soon to come now; and in 1845, seeing it on the way, he launched the brilliantly destructive series of speeches which, though they could not prevent the abolition of the corn-laws, abolished the minister who ended them. These speeches appeal more to admiration than to sympathy, even where the limitations of Disraeli's protectionist beliefs are understood, and where his perception of the later consequences of free trade is most cordially acknowledged. That he remained satisfied with them himself is doubtful, unless for their foresight, their tremendous effect as instruments of punishment, and as they swept him to so much distinction. Within three years, on the death of Lord George Bentinck, there was none to dispute with him the leadership of the Conservative party in the House of Commons.

In the parliament of 1841 he was member for Shrewsbury. In 1847 he was returned for Buckinghamshire, and never again had occasion to change his constituency. Up to this time his old debts still embarrassed him, but now his private and political fortunes changed together. Froude reports that he "received a large sum from a private hand for his *Life of Lord George Bentinck*" (published in 1852), "while a Conservative millionaire took upon himself the debts to the usurers; the 3 per cent. with which he was content being exchanged for the 10 per cent. under which Disraeli had been staggering." In 1848 his father Isaac Disraeli died, leaving to his son Benjamin nearly the whole of his estate. This went to the purchase of Hughenden Manor—not, of course, a great property, but with so much of the pleasant and picturesque, of the dignified also, as quite to explain what it was to the affectionate fancy of its lord. About this time, too (1851), his acquaintance was sought by an old Mrs Brydges Willyams—born a Spanish Jewess and then the widow of a long-deceased Cornish squire—who in her distant home at Torquay had conceived a restless admiration for Benjamin Disraeli. She wrote to him again and again, pressing for an appointment to consult on an important matter of business: would meet him at the fountain of the Crystal Palace in Hyde Park. Her importunity succeeded, and the very small, oddly-dressed, strange-mannered old lady whom Disraeli met at the fountain became his adoring friend to the end of her life. Gratitude for her devotion brought him and his wife in constant intimacy with her. There were many visits to Torquay; he gratified her with gossiping letters about the great people with whom and the great affairs with which the man who did so much honour to her race was connected, that being the inspiration of her regard for him. She died in 1863, leaving him all her fortune, which was considerable; and, as she wished, was buried at Hughenden, close to the grave where Disraeli was to lie.

It is agreed that the first three years of Disraeli's leadership in Opposition were skilfully employed in reconstructing the shattered Tory party. In doing this he made it sufficiently clear that there could be no sudden

return to Protectionist principles. At the same time, however, he insisted (as he did from first to last) on the enormous importance to the country, to the character of its people no less than to its material welfare, of agricultural contentment and prosperity; and he also obtained a more general recognition of the fact that "the land" had borne fiscal burdens under the old régime which were unfair and unendurable under the new. So far he did well; and when in 1852 he took office as chancellor of the exchequer in Lord Derby's first Administration, the prospect was a smiling one for a man who, striving against difficulties and prejudices almost too formidable for imagination in these days, had attained to a place where he could fancy them all giving way. That, however, they were not. New difficulties were to arise and old prejudices to revive in full force. His first budget was a quaint failure, and was thrown out by a coalition of Liberals and Peelites which he believed was formed against Mr Disraeli more than against the chancellor of the exchequer. It was on this occasion that he exclaimed, "England does not love coalitions." After a reign of ten months he was again in Opposition, and remained so for seven years. Of the Crimean war he had a better judgment than those whose weakness led them into it, and he could tell them the whole truth of the affair in twenty words: "You are going to war with an opponent who does not want to fight, and whom you are unwilling to encounter." Neither were they prepared; and the scandals and political disturbances that ensued revealed him as a party leader who could act on such occasions with a dignity, moderation, and sagacity that served his country well, maintained the honour of party government, and cost his friends nothing. The mismanagement of the war broke down the Aberdeen Government in 1855, and then Disraeli had the mortification of seeing a fortunate chance of return to office lost by the timidity and distrust of his chief, Lord Derby—the distrust too clearly including the undervaluation of Disraeli himself. Lord Derby wanted Lord Palmerston's help, Mr Gladstone's, Mr Sidney Herbert's. This arrangement could not be made; Lord Derby therefore gave up the attempt to form a ministry, and Lord Palmerston came in. The next chance was taken in less favouring times. The Government in which Disraeli was again financial minister lasted for less than eighteen months (1858-59), and then ensued another seven years in the cold and yet colder shade of Opposition. Both of these seven-year outings were bad, but the second by far the worse. Parliamentary reform had become a burning question and an embarrassing one for the Tory party. An enormous increase of business, consequent upon the use of steam machinery and free-trade openings to commerce, filled the land with prosperity, and discredited all statesmanship but that which steered by the star over Manchester. Mr Gladstone's budgets, made possible by this prosperity, were so many triumphs for Liberalism. Foreign questions arose which strongly excited English feeling—the arrangements of peace with Russia, Italian struggles for freedom, an American quarrel, the *Arrow* affair and the Chinese war, the affair of the French colonels, and the Conspiracy Bill; and as they arose Palmerston gathered into his own sails (except on the last occasion) every wind of popular favour. Amid all this the Tory fortunes sank rapidly, becoming nearly hopeless when Lord Palmerston, without appreciable loss of confidence on his own side, persuaded many Tories in and out of Parliament that Conservatism would suffer little while he was in power. Yet there was great despondency, of course, in the Conservative ranks; with despondency discontent; with discontent rancour. The prejudice against Disraeli as Jew, the revolt at his theatric-

Commons.

calisms, the distrust of him as "mystery man," which up to this time had never died out even among men who were his nearest colleagues, were now more openly indulged. Out of doors he had a "bad press," in Parliament he had some steady, enthusiastic friends, but more that were cold. Sometimes he was seen on the front Opposition bench for hours quite alone. Little conspiracies were got up to displace him, and might have succeeded but for an unconquerable dread of the weapon that destroyed Peel. In this state of things he patiently held his ground, working for his party more carefully than it knew, and never seizing upon false or discrediting advantages. But it was an extremely bad time for Benjamin Disraeli.

Though Lord Palmerston stumbled over his Foreign Conspiracy Bill in 1858, his popularity was little damaged, and it was in no hopeful spirit that the Tories took office again in that year. They were perilously weak in the House of Commons, and affairs abroad, in which they had small practice and no prestige, were alarming. Yet the new Administration did very well till, after resettling the government of India, and recovering from a blunder committed by their Indian secretary, Lord Ellenborough, they must needs launch a Reform Bill to put that dangerous question out of controversial politics. The well-intended but fantastic measure brought in for the purpose was rejected. The country was appealed to, with good but insufficient results; and at the first meeting of the new parliament the Tories were turned out on a no-confidence vote moved by Lord Hartington. Foreign affairs supplied the motive: failure to preserve the peace of Europe at the time of the Italian war of independence. It is said that the Foreign Office had then in print a series of despatches which would have answered its accusers had they been presented when the debate began, as for some unexplained reason they were not. Lord Palmerston now returned to Downing Street, and while he lived Disraeli and his colleagues had to satisfy themselves with what was meant for useful criticism, though with small hope that it was so for their own service. A Polish insurrection, the Schleswig-Holstein question, a commercial treaty with France, the civil war in America, gave Disraeli occasions for speech that was always forcible and often wiser than all could see at the time. He never doubted that England should be strictly neutral in the American quarrel when there was a strong feeling in favour of the South. All the while he would have gladly welcomed any just means of taking an animated course, for these were dull, dark days for the Conservatives as a parliamentary party. Yet, unperceived, Conservatism was advancing. It was much more than a joke that Palmerston sheltered Conservative principles under the Liberal flag. The warmth of his popularity, to which Radical applause contributed nothing in his later days, created an atmosphere entirely favourable to the quiet growth of Conservatism. He died in 1865. Earl Russell succeeded him as prime minister, Mr Gladstone as leader of the House of Commons. The party most pleased with the change was the Radical; the party best served was Disraeli's. Another Reform Bill, memorable for driving certain good Liberals into a Cave of Adullam, broke up the new Government in a few months; Disraeli contributing to the result by the delivery of opinions not new to him and of lasting worth, though presently to be subordinated to arguments of an inferior order and much less characteristic. "At this rate," he said in 1866, "you will have a parliament that will entirely lose its command over the executive, and it will meet with less consideration and possess less influence." Look for declining statesmanship, inferior aptitude, genius dying off. "Instead of these you will have a horde of selfish and obscure mediocrities, incapable of anything but

mischief, and that mischief devised and regulated by the raging demagogue of the hour." The Reform legislation which promised these results in 1866 was thrown out. Lord Derby's third Administration was then formed in the summer of the same year, and for the third time there was a Tory Government on sufferance. Its followers were still a minority in the House of Commons; an angry Reform agitation was going on; an ingenious resolution founded on the demand for an enlarged franchise serviceable to Liberals might extinguish the new Government almost immediately; and it is pretty evident that the Tory leaders took office meaning to seek a cure for this desperate weakness by wholesale extension of the suffrage. Their excuses and calculations are well known, but when all is said, Lord Derby's statement of its character, "a leap in the dark," and of its intention, "dishing the Whigs," cannot be bettered. Whether Lord Derby or Mr Disraeli originated this resolve has been much discussed, and it remains an unsettled question. It is known that Disraeli's private secretary, Mr Ralph Earle, quarrelled with him violently at about this time; and Sir William Fraser relates that, meeting Mr Earle, that gentleman said: "I know what your feelings must be about this Reform Bill, and I think it right to tell you that it was not Disraeli's Bill, but Lord Derby's. I know everything that occurred." Mr Earle gave the same assurances to the writer of these lines, and did so with hints and half-confidences (quite intelligible, however) as to the persuasions that wrought upon his chief. Mr Earle's listener on these occasions confesses that he heard with a doubting mind, and that belief in what he heard still keeps company with Mahomet's coffin. One thing, however, is clear. To suppose Disraeli satisfied with the excuses made for his adoption of the "dishing" process is forbidden by the whole tenor of his teaching and conduct. He could not have become suddenly blind to the fallacy of the expectations derived from such a course; and all his life it had been his distinction to look above the transient and trafficking expedients of the professional politician. However, the thing was done. After various remodellings, and amid much perturbation, secession, violent reproach, the Household Suffrage Bill passed in August 1867. Another memorable piece of work, the Confederation of Canada, had already been accomplished. A few days after Parliament met in the next year Lord Derby's failing health compelled him to resign, and Mr Disraeli became prime minister. Irish disaffection had long been astir; the Fenian menace looked formidable not only in Ireland but in England also. The reconstructed Government announced its intention of dealing with Irish grievances. Mr Gladstone approved, proposing the abolition of the Irish Church to begin with. A resolution to that effect was immediately carried against the strong opposition of the Government. Disraeli insisted that the question should be settled in the new parliament which the Franchise Act called for, and he seems to have had little doubt that the country would declare against Mr Gladstone's proposal. He was mistaken. It was the great question at the polls; and the first elections by the new constituencies went violently against the authors of their being.

The history of the next five years is Mr Gladstone's. The Irish Church abolished, he set to work with passionate good intention on the Irish land laws. The while he did so sedition took courage and flourished exceedingly, so that to pacify Ireland the constable went hand in hand with the legislator. The abolition of the Irish Church was followed by a Coercion Act, and the Land Act by suspension of *Habeas Corpus*. Disraeli, who at

1868.*

first preferred retirement and the writing of *Lothair*, came forward from time to time to point the moral and predict the end of Mr Gladstone's impulsive courses, which soon began to fret the confidence of his friends. Some unpleasant errors of conduct—the Collier case, the Ewelme rectory case, the grave and significant Odo Russell scandal (to help the Government out of a scrape the ambassador was wrongfully accused of exceeding his instructions)—told yet more. Above all, many humiliating proofs that England was losing her place among the nations came out in these days, the discovery being then new and unendurable. To be brief, in less than four years the Government had well-nigh worn out its own patience with its own errors, failures, and distractions, and would gladly have gone to pieces when it was defeated on an Irish University Bill. But Disraeli, having good constitutional reasons for declining office at the moment, could not allow this. Still gathering unpopularity, still offending, alarming, alienating, the Government went on till 1874, suddenly dissolved Parliament, and was signally beaten, the Liberal party breaking up. Like most of his political friends, Disraeli had no expectation of such a victory—little hope, indeed, of any distinct success. Yet when he went to Manchester on a brief political outing two years before, he was received with such acclaim as he had never known in his life. He was then sixty-eight years old, and this was his first full banquet of popularity. The elation and confidence drawn from the Manchester meetings were confirmed by every circumstance of the 1874 elections. But he was well aware of how much he owed to his opponents' errors, seeing at the same time how safely he could lay his future course by them. He had always rejected the political economy of his time, and it was breaking down. He had always refused to accept the economist's dictum without reference to other considerations than the turnover of trade; and even Manchester could pardon the refusal now. The national spirit, vaporized into a cosmopolitan mist, was fast condensing again under mortification and insult from abroad uncompensated by any appreciable percentage of cash profit. This was a changing England, and one that Disraeli could govern on terms of mutual satisfaction; but not if the reviving "spirit of the country" ran to extremes of self-assertion. At one of the great Manchester meetings he said, "Do not suppose, because I counsel firmness and decision at the right moment, that I am of that school of statesmen who are favourable to a turbulent and aggressive diplomacy. I have resisted it during a large part of my life."

But for the hubbub occasioned by the Public Worship Regulation Act, the first two years of the 1874 administration had no remarkable excitements till near the end of them. The Public Worship Act, introduced by the Archbishop of Canterbury, was meant to restrain ritualism. Disraeli, who from first to last held to the Reformed Church as capable of dispensing social good as no other organisation might, supported the Bill as "putting down ritualism"; spoke very vehemently; gave so much offence that at one time neither the Bill nor the Government seemed quite safe. For some time afterwards there was so little legislation of the kind called "enterprising" that even some friends of the Government began to think it too tame; but at the end of the second year an announcement was made which put that fear to rest. The news that the Khedive's Suez Canal shares had been bought by the Government was received with boundless applause. It was a courageous thing to do; but it was not a Disraelian conception, nor did it originate in any Government department. It was suggested from without at a moment when the possibility of ever acquiring the shares was passing away. On the

morning of the 15th of November 1875, the then editor of the *Pall Mall Gazette* went to Lord Derby at the Foreign Office, informed him that the Khedive's shares were passing into the hands of a French syndicate, and urged arrest of the transaction by purchase for England. (The shares being private property their sale could not, of course, be forbidden.) Lord Derby thought there must be a mistake. He could not believe that bargaining of that kind could go on in Cairo without coming to the knowledge of the British Consul there. He was answered that nevertheless it was going on. The difficulties of purchase by England were then arrayed by Lord Derby. They were more than one or two, and of course they had a formidable look; but so also had the alternative and the lost opportunity. One difficulty had already come into existence, and had to be met at once. Lord Derby had either to make direct inquiry of the Khedive or to let the matter go. If he inquired, and there was no such negotiation, his question might be interpreted in a very troublesome way; moreover, we should put the idea of selling the shares into the Khedive's head, which would be unfortunate. "There's my position, and now what do you say?" The answer given, Lord Derby drafted a telegram to the British Consul-General at Cairo, and read it out. It instructed Colonel Stanton to go immediately to the Khedive and put the question point blank. Meanwhile the prime minister would be seen, and Lord Derby's visitor might call next day to hear the reply from Cairo. It is enough to add here that on receipt of the answer the purchase for England was taken up and went to a speedy conclusion.

As if upon the impulse of this transaction, Disraeli opened the next session of Parliament with a Bill to confer upon the Queen the title of Empress of India—a measure which offended the instincts of many Englishmen, and, for the time, revived the prejudices against its author. More important was the revival of disturbances in European Turkey, which, in their outcome, were to fill the last chapter of Disraeli's career. But for this interruption it is likely that he would have given much of his attention to Ireland, not because it was an attractive employment for his few remaining years, but because he saw with alarm the gathering troubles in that country. And his mind was strongly drawn in another direction. In a remarkable speech delivered in 1872, he spoke with great warmth of the slighting of the colonies, saying that "no minister in this country will do his duty who neglects any opportunity of reconstructing as much as possible our colonial empire, and of responding to those distant sympathies which may become the source of incalculable strength and happiness to this island." However, nothing was done in fulfilment of this duty in the first two years from 1874, and early in the third the famous Andassy note, the Berlin memorandum, the Bashibazouk atrocities, and the accumulative excitement thereby created in England, reopened the Eastern question with a vengeance. The policy which Disraeli's Government now took up may be truly called the national policy. Springing from the natural suggestions of self defence against the march of a dangerous rivalry, it had the sanction of all British statesmanship for generations, backed by the consenting instinct of the people. It was quite unsentimental, being pro-Turkish or anti-Russian only as it became so in being pro-British. The statesmen by whom it was established and continued saw in Russia a Power which, unless firmly kept within bounds, would dominate Europe; more particularly, that it would undermine and supersede British authority in the East. And without nicely considering the desire of Russia to expand to the Mediterranean, the Pacific, or in any other

Suez Canal Shares.

direction, they thought it one of their first duties to maintain their own Eastern empire; or, to put it another way, to contrive that Great Britain should be subject to Russian ascendancy (if ever), at the remotest period allowed by destiny. Such were the ideas on which England's Russian policy was founded. In 1876 this policy revived as a matter of course in the Cabinet, and as spontaneously, though not upon a first provocation, became popular almost to fury. And furiously popular it remained. But a strong opposing current of feeling, equally passionate, set in against the Turks; war began and lasted long; and as the agitation at home and the conflict abroad went on, certain of Disraeli's colleagues, who were staunch enough at the beginning, gradually weakened. It is certainly true that Disraeli was prepared, in all senses of the word, to take strong measures against such an end to the war as the San Stefano treaty threatened. Rather than suffer that, he would have fought the Russians in alliance with the Turks, and had gone much farther in maturing a scheme of attack and defence than was known at the time or is commonly known now. That there was a master motive for this resolution may be taken for granted; and it is to be found in a belief that not to throw back the Russian advance then was to lose England's last chance of postponing to a far future the predominance of a great rival power in the East. How much or how little judgment shows in that calculation, when viewed in the light of later days, we do not discuss. What countenance it had from his colleagues dropped away. At the end their voices were strong enough to insist upon the diplomatic action which at no point falls back on the sword; Lord Derby (foreign minister) being among the first to make a stand on that resolution, though he was not the first seceder from the Government. Such diplomacy in such conditions is paralytic. It cannot speak thrice, with whatever affectation of boldness, without discovering its true character to trained ears; which should be remembered when Disraeli's successes at Berlin are measured. It should be remembered that what with the known timidity of his colleagues, and what with the strength and violence of the Russian party in England, his achievement at Berlin was like the reclamation of butter from a dog's mouth; as Prince Bismarck understood in acknowledging Disraeli's gifts of statesmanship. It should also be remembered, when his Eastern policy in 1876-78 is denounced as malign and a failure, that it was never carried out. Good or bad, ill or well calculated, effective existence was denied to it; and a man cannot be said to have failed in what he was never permitted to attempt. The nondescript course of action which began at the Constantinople Conference and ended at Berlin was not of his direction until its few last days. It only marked at various stages the thwarting and suppression of his policy by colleagues who were haunted night and day by memories of the Crimean war, and not least, probably, by the fate of the statesmen who suffered for its blunders and their own. Disraeli also looked back to those blunders, and he was by no means insensible to the fate of fallen ministers. But just as he maintained at the time of the conflict, and after, that there would have been no Crimean war had not the British Government convinced the Tsar that it was in the hands of the peace party, so now he believed that a bold policy would prevent or limit war, and at the worst put off grave consequences which otherwise would make a rapid advance.

As if aware of much of this, the country was well content with Disraeli's successes at Berlin, though sore on some points, he himself sharing the soreness. Yet there were great days for him after his return. At the

Berlin Conference he had established a formidable reputation; the popularity he enjoyed at home was affectionately enthusiastic; no minister had ever stood in more cordial relations with his sovereign; and his honours in every kind were his own achievement against unending disadvantage. But he was soon to suffer irretrievable defeat. A confused and unsatisfactory war in Afghanistan, troubles yet more unsatisfactory in South Africa, conspired with two or three years of commercial distress to invigorate "the swing of the pendulum" when he dissolved parliament in 1880. Dissolution the year before would have been wiser, but a certain pride forbade. The elections went heavily against him. He took the blow with composure, and sank easily into a comparative retirement. Yet he still watched affairs as a great party leader should, and from time to time figured vigorously in debate. Meanwhile he had another novel to sit down to—the poor though highly characteristic *Endymion*; which, to his great surprise and equal pleasure, was replaced on his table by a cheque for ten thousand pounds. Yet even this satisfaction had its tang of disappointment; for though *Endymion* was not wholly written in his last days, it was in no respect the success that *Lothair* was. This also he could bear. His description of his grandfather recurs to us: "A man of ardent character, sanguine, courageous, and fortunate, with a temper which no disappointment could disturb."

As Earl of Beaconsfield (failing health had compelled him to take refuge in the House of Lords in 1876) Benjamin Disraeli died in his house in Curzon Street on the 19th of April 1881. The likelihood of his death was publicly known for some days before the event, and then the greatness of his popularity and its warmth were declared for the first time. No such demonstration of grief was expected even by those who grieved the most. He lies in Hughenden churchyard, in a rail-enclosed grave, with liberty for the turf to grow between him and the sky. Within the church is a marble tablet, placed there by his Queen, with a generous inscription to his memory. The anniversary of his death has since been honoured in an unprecedented manner, the 19th of April being celebrated as "Primrose Day"—the primrose, for reasons impossible accurately to define, being popularly supposed to have been Disraeli's favourite flower. Even among his friends in youth (Sir Edward Lytton Bulwer, for example), and not improbably among the City men who wagered their money in irrecoverable loans to him on the chance of his success, there may have been some who compassed the thought of Benjamin Disraeli as prime minister and peer; but at no time could any fancy have imagined him remembered so enduringly as Lord Beaconsfield has been. It is possible that Sarah Disraeli (the Myra of *Endymion*), or that "the most severe of critics but a perfect wife," may have had such dreams—hardly that they could have occurred to any mind but a devoted woman's. Disraeli's life was a succession of surprises, but none was so great as that he should be remembered after death more widely, lastingly, respectfully, affectionately, than any other statesman in the long reign of Queen Victoria. While he lived he did not seem at all cut out for that distinction even as an Imperialist. Significant as was the common grief when he died, no such consequence could be inferred from it, and certainly not from the elections of 1880. It stands, however, this high distinction, and with it the thought that it would have been denied to him altogether had the "adventurer" and "mystery man" of the 'sixties died at the age of threescore years and ten. We have said that never till 1872 did he look upon the full cup of popularity. It might have been said that even at that

*Death and
Influence.*

time intrigue to get rid of him had yet to cease in his own party; and but a few years before, a man growing old, he was still in the lowest deeps of his disappointments and humiliations. How, then, could it be imagined that with six years of power from his seventieth year, the Jew "adventurer," mysterious and theatrical to the last, should fill a greater space in the mind of England twenty years after death than Peel or Palmerston after five? Of course it can be explained; and when explained, we see that Disraeli's good fortune in this respect is not due entirely to his own merits. His last years of power might have been followed by as long a period of more acceptable government than his own, to the effacement of his own from memory; but that did not happen. What did follow was a time of universal turbulence and suspicion, in which the pride of the nation was wounded again and again. To say "Majuba" and "Gordon" recalls its deepest hurts, but not all of them; and it may be that a pained and angry people, looking back, saw in the man whom they lately displaced more than they had ever seen before. From that time, at any rate, Disraeli has been acknowledged as the regenerator and representative of the Imperial idea in England. He has also been accused on the same grounds; and if the giver of good wine may be blamed for the guest who gets drunk on it, there is justice in the accusation. It is but a statement of fact, however, that Disraeli retains his hold upon the popular mind on this account mainly. The rekindling of the Imperial idea is understood as a timely act of revolt and redemption: of revolt against continuous humiliations deeply felt, redemption from the fate of nations obviously weak and suspected of timidity. It has been called rescue-work—deliverance from the dangers of invited aggression and a philosophical neglect of the means of defence. And its first achievement for the country (this is again a mere statement of fact) was the restoration of a much-damaged self-respect and the creation of a great defensive fleet not a day too soon for safety. So much for "the great heart of the people." Meanwhile political students find to their satisfaction that he never courted popularity, and never practised the art of working for "quick returns" of sympathy or applause. As "adventurer" he should have done so; yet he neglected the cultivation of that paying art for the wisdom that looks to the long future, and bears its fruit, perchance, when no one cares to remember who sowed the seed. So it is that to read some of his books and many of his speeches is to draw more respect and admiration from their pages than could have been found there originally. The student of his life understands that Disraeli's claim to remembrance rests not only on the breadth of his views, his deep insight, his long foresight, but even more on the courage which allowed him to declare opinions supplied from those qualities when there was no visible likelihood of their justification by experience, and therefore when their natural fate was to be slighted. His judgments had to await the event before they were absolved from ridicule or delivered from neglect. The event arrives; he is in his grave; but his reputation loses nothing by that. It gains by regret that Death was beforehand with him.

"Adventurer," as applied to Disraeli, was a mere term of abuse. "Mystery-man" had much of the same intention, but in a blameless though not in a happy sense it was true of him to the end of his days. Even to his friends, and to many near him, he remained mysterious to the last. It is impossible to doubt that some two or three, four or five perchance, were at home in his mind, being freely admitted there; but of partial admissions to its inner places there seem to have been few or none. Men who were long associated with him in affairs, and had

much of his stunted companionship, have confessed that with every wish to understand his character they never succeeded. Sometimes they fancied they had got within the topping walls of the maze, and might hope to gain the point whence survey could be made of the whole; but as often they found themselves, in a moment, where they stood at last and at first—outside. His speeches carry us but a little way beyond the mental range; his novels rather baffle than instruct. It is commonly believed that Disraeli looked in the glass while describing Sidonia in *Coningsby*. We group the following sentences from this description for a purpose that will be presently seen:—(1) "He was admired by women, idolized by artists, received in all circles with great distinction, and appreciated for his intellect by the very few *Character.* to whom he at all opened himself." (2) "For, though affable and generous, it was impossible to penetrate him: though unreserved in his manners his frankness was limited to the surface. He observed everything, thought ever, but avoided serious discussion. If you pressed him for an opinion he took refuge in raillery, and threw out some paradox with which it was not easy to cope. The secret history of the world was Sidonia's pastime. His great pleasure was to contrast the hidden motive with the public pretext of transactions." (3) "He might have discovered a spring of happiness in susceptibilities of the heart; but this was a sealed fountain for Sidonia. In his organization there was a peculiar, perhaps a great deficiency; he was a man without affection. It would be hard to say that he had no heart, for he was susceptible of deep emotions; but not for individuals. Woman was to him a toy, man a machine." These sentences are separately grouped here for the sake of suggesting that they will more truly illustrate Disraeli's character if taken as follows:—The first as representing his most cherished social ambitions—in whatever degree achieved. The second group as faithfully and closely descriptive of himself: descriptive too of a character purposely cloaked. The third as much less simple; in part a mixture of truth with Byronic affectation, and for the rest (and more significantly), as intimating the resolute exercise of extraordinary powers of control over the promptings and passions by which so many capable ambitions have come to grief. So read, Sidonia and Benjamin Disraeli are brought into close resemblance by Disraeli himself; for what in this description is untrue to the suspected fundamentals of his character is true to his known foibles. But for a general interpretation of Lord Beaconsfield and his career none serves so well as that which Froude insists on most. He was thoroughly and unchangeably a Jew. At but one remove, by birth, from southern Europe and the East, he was an Englishman in nothing but his devotion to England and his solicitude for her honour and prosperity. It was not wholly by volition and design that his mind was strange to others and worked in absolute detachment. He had "none of the hereditary prepossessions of the native Englishman." No such prepossessions disturbed his vision when it was bent upon the rising problems of the time, or rested on the machinery of government and the kind of men who worked it and their ways of working. The advantages of Sidonia's intellect and temperament were largely his, in affairs, but not without their drawbacks. His pride in his knowledge of the English character was the pride of a student; and we may doubt if it ever occurred to him that there would have been less pride but more knowledge had he been an Englishman. It is certain that in shrouding his own character he checked the communication of others to himself, and so could continue to the end of his career the costly mistake of being theatrical in England. There

was a great deal too (though little to his blame) in Lord Malmesbury's observation that he was not only disliked in the House of Commons for his mysterious manner, but prejudiced by a pronounced foreign air and aspect. Lord Malmesbury does not put it quite as strongly as that, but he might have done so with truth. No Englishman could approach Disraeli without some immediate consciousness that he was in the presence of a foreigner.

Lord Beaconsfield has been praised for his integrity in money-matters: the praise could have been spared—it does not rise high enough. It is also said to his honour that he “never struck at a little man,” and that was well; but it is explained as readily by pride and calculation as by magnanimity. A man of extraordinary coolness and self-control, his faults in every kind were faults of excess: it is the mark of them all. But whatever offence they gave, whatever mischief they did, was soon exhausted, and has long since been pardoned.

Beaconsfield, a town of Cape Colony in Griqualand West, nearly 2 miles S.W. of Kimberley, after which it ranks as the most important place in the diamond fields. Although dating only from 1870, when it was founded near the famous Dutoit's Pan mine, and still figured on but few maps, it had a population in 1891 of 10,500, and in 1898 of over 13,000. In the same district are also the rich De Beer's and Bultfontein mines, for the collective output of which, see KIMBERLEY.

Beardsley, Aubrey Vincent (1872-1898), English artist in black and white, was born at Brighton, 24th August 1872. In 1883 his family settled in London, and in the following year he appeared in public as an “infant musical phenomenon,” playing at several concerts with his sister. In 1888 he obtained a post in an architect's office, and afterwards one in the Guardian Life and Fire Insurance Company (1889). In 1891, under the advice of Sir Edward Burne-Jones and M. Puvis de Chavannes, he took up art as a profession. In 1892 he attended the classes at the Westminster School of Art, then under Professor Brown; and from 1893 until his death, at Mentone, 16th March 1898, his work came continually before the public, arousing a storm of criticism and much hostile feeling. Beardsley had an unswerving tendency towards the fantastic of the gloomier and “unwholesome” sort. His treatment of most subjects was revolutionary; he deliberately ignored proportion and perspective, and the “freedom from convention” which he displayed caused his work to be judged with harshness. In certain phases of technique he especially excelled; and his earlier methods of dealing with the single line in conjunction with masses of black are in their way unsurpassed, except in the art of Japan, the country which probably gave his ideas some assistance. He was always an ornamentist, rather than an illustrator; and his work must be judged from that point of view. His frontispiece to *Volpone* is held by some to be, from this purely technical standpoint, one of the best pen-drawings of the age. His posters for the Avenue Theatre and for Mr Fisher Unwin were among the first of the modern cult of that art.

The following are the chief works which are illustrated with drawings by Beardsley: the *Bon Mot* Library, *The Pall Mall Budget*, and *The Studio* (1893), Sir Thomas Malory's *Morte d'Arthur* (1893-94),

Salomé (1894), *The Yellow Book* (1894-95), *The Savoy Magazine* (1896), *The Rape of the Lock* (1896).

Beardstown, a city of Cass county, Illinois, U.S.A., situated in the western part of the state, on the east bank of Illinois river, at an altitude of 448 feet. It is entered by two railways, the Baltimore and Ohio South-Western, and the Chicago, Burlington, and Quincy. Population (1880), 3135; (1890), 4226; (1900), 4827.

Bearings, Ball and Roller.—There are two methods usually adopted for the transport of loads along roads, namely, by wheels or by rollers. The former consists of a disc or wheel, turning on a spindle or axle; in this case frictional resistance due to the load is exerted at the bearing surface of the wheel on the axle, and has to be met and overcome. The latter arrangement, in its primitive form, is usually adopted for the transport of heavy loads only. It possesses the advantage that, as there is no rubbing contact between the surface of the rollers and the load, purely frictional resistances do not exist. This argument is strictly only true when the rollers are hard and work on true hard surfaces. The ball bearing, which has done much to make the cycle carriage efficient, combines the adoption of the principle involved in the latter method described above, with its application to the former, so that the frictional resistances which would otherwise exist between wheel and axle are practically eliminated. In place of rollers, however, balls are generally used, especially for light loads, as they possess the obvious advantage that, being symmetrical about a centre, there is no need to constrain them, as in the case of rollers whose axes must be kept in correct relation to each other. It will be seen that in the case of a sphere placed between two plane surfaces actual contact is made at two points only, and the stresses at these points under a load are correspondingly severe. For this reason it is necessary to employ in a bearing a large number of balls in order to increase the points of support, and to make the balls themselves and the paths on which they run of the finest hardened steel, and perfectly true in form. Perfect rolling contact is only obtained when the balls and contact surfaces touch at points, and then only when the parts in contact are not constrained to move at different speeds in relation to each other. It is frequently the case that, in order to obtain more contact surface so as better to support a load, the paths on which the balls run are curved to fit the balls, but in such cases friction, due to rubbing contact in place of true rolling contact, must necessarily result. In light machines, such as bicycles, it is customary to have one circle of balls to each bearing, but for heavier bearings these are increased in number; and as the examination and separation of a bearing with a large number of balls would be exceedingly inconvenient, it is customary to carry the balls in cages or some similar device. Where heavy loads have to be carried it is customary to use rollers in a bearing in place of balls, with very satisfactory results. It is absolutely necessary, however, that the axes of the rollers should retain a symmetrical relation to each other, and that their peripheries should not touch, or friction will result.

BALL BEARING.

The circle of rollers is therefore carried either in a cage or some other contrivance. A well-designed bearing is shown in the figure. The balls and paths are capable of ready removal from the outer bracket support, and when removed the balls are prevented from falling by the ring paths. Very heavy loads, such as bridges, guns, and their mountings, &c., are commonly carried on a circle of rollers, forming in effect roller bearings, with such excellent results that the resistance to rotation is very small compared with the total load. (G. H. BA.)

Beatrice, capital of Gage county, Nebraska, U.S.A., situated in the south-eastern part of the state, in the valley of Big Blue river, at an altitude of 1265 feet, in an agricultural region. It has three railways: the Burlington and Missouri River; the Chicago, Rock Island, and Pacific; and the Union Pacific. Population (1900), 7875.

Beaulieu, a French village in the arrondissement of Nice, department of Alpes Maritimes, 5 miles E. by N. of Nice and 1 mile S.E. of Villefranche, of which it may be regarded as an extension. Formerly a mere hamlet, it has become in recent years a frequented and fashionable winter resort, and has numerous handsome villas. In the vicinity are interesting grottoes. Population (1891), 184; (1896), 1031.

Beaumont, capital of Jefferson county, Texas, U.S.A., situated on Neches river, in the eastern part of the state, in a rich agricultural region, where cotton is the principal product. It is surrounded by dense forests of pine and cypress, and has extensive lumber manufactures. In 1901 wells were sunk at Beaumont, and petroleum was found in large quantities. It is at the intersection of four railways, affording communication in all directions. Population (1900), 9427.

Beaumont, Sir John (1583-1627), English poet, second son of the judge, Sir Francis Beaumont, was born at Grace-Dieu, in Leicestershire, in 1583. The deaths of his father (in 1598) and of his elder brother, Sir Henry Beaumont (in 1605), made the poet early the head of this brilliant family; the dramatist, Francis Beaumont, being a younger brother. John went to Oxford in 1596, and entered as a gentleman commoner in Broadgate's Hall, the present Pembroke College. It is said that he was intended for the law, but on the death of Henry he no doubt went down to Grace-Dieu to manage the family estates. He began to write verse early, and in 1602, at the age of nineteen, he published anonymously his *Metamorphosis of Tobacco*, written in very smooth couplets, in which he addressed Drayton as his "loving friend." He lived in Leicestershire for many years as a bachelor, being one "who never felt Love's dreadful arrow." But in process of time he became a tardy victim, and married a lady of the Fortescue family, who bore him four stout sons, the eldest of whom, another John, was accounted one of the most athletic men of his time. "He could leap 16 feet at one leap, and would commonly, at a stand-leap, jump over a high long table in the hall, light on a settle beyond the table, and raise himself straight up." This magnificent young man was not without literary taste; he edited his father's posthumous poems, and wrote an enthusiastic elegy on him; he was killed in 1644 at the siege of Gloucester. Another of Sir John Beaumont's sons, Gervaise, died in childhood, and the incidents of his death are recorded in one of his father's most touching poems. Sir John Beaumont concentrated his powers on a poem in eight books, entitled *The Crown of Thorns*, which was greatly admired in MS. by the earl of Southampton and others, but which is lost. After long retirement, Beaumont was persuaded by the duke of Buckingham to move in larger circles; he

attended court, and in 1626 was made a baronet. This honour he did not long survive, for he died on the 19th of April 1627, and was buried in Westminster Abbey ten days later. The new Sir John, the strong man, published in 1629 a volume entitled *Bosworth Field; with a taste of the variety of other Poems left by Sir John Beaumont*. No more "tastes" were ever vouchsafed, so that it is by this volume and by the juvenile *Metamorphosis of Tobacco* that Beaumont's reputation has to stand. Of late years, the peculiarities of John Beaumont's prosody have drawn attention to his work. He wrote the heroic couplet, which was his favourite measure, with almost unprecedented evenness. *Bosworth Field*, the scene of the battle of which Beaumont's principal poem gives a vaguely epical narrative, lay close to the poet's house of Grace-Dieu. He writes on all occasions with a smoothness which was very remarkable in the first quarter of the 17th century, and which marks him, with Waller and Sandys, as one of the pioneers of the classic reformation of English verse. (E. G.)

Beauregard, Pierre Gustave Toutant (1818-1893), American soldier, was born near New Orleans, Louisiana, on 28th May 1818. At the United States military academy he graduated second in his class in July 1838, and was detailed as a lieutenant of engineers. In the Mexican war he distinguished himself in siege operations at Vera Cruz, and upon the advance to the Mexican capital was wounded and twice brevetted. As captain of engineers, in March 1853, he took charge of constructive defences in and about Louisiana and the Gulf coast (1853-60), and was superintendent at West Point in January 1861 for a few days. Resigning his United States commission on 20th February 1861, he became a brigadier-general of the new Southern Confederacy, and was sent to direct the operations at Charleston, South Carolina, which resulted in the capture of Fort Sumter and the outbreak of civil war. Ordered next to Virginia, he won, with General Joseph E. Johnston, the first battle of Bull Run (21st July), was promoted to general, and in the spring of 1862 went to Tennessee as second in command to General Albert S. Johnston. When that officer was killed during the battle of Shiloh on 6th April, Beauregard assumed command. Nearly routing his adversary the first day, he was compelled on the second to fall back to Corinth, Mississippi, which he evacuated in good order on 30th May, upon General Halleck's approach. His health now failing, he performed less conspicuous service; defending Charleston (September 1862-April 1864); reinforcing Lee near Petersburg (May 1864); and later in 1864 attempting with inadequate troops to resist General Sherman's march through Georgia and the Carolinas. With General Joseph E. Johnston he surrendered to Sherman in April 1865. After the war he engaged in railway management, became adjutant-general of his native state, and served the Louisiana lottery. He died in New Orleans, 20th February 1893.

Beauvais, chief town of department of Oise, France, 44 miles N.N.W. of Paris, with stations on the railway from Paris to Tréfort and other lines. Besides its other industries, Beauvais is a great centre of toy manufactures. Population (1881), 14,934; (1896), 16,371.

Beaverdam, a city of Dodge county, Wisconsin, U.S.A., situated in the south-eastern part of the state, in 45° 28' N. lat., and 88° 52' W. long., at an altitude of 873 feet. The Chicago, Milwaukee, and St Paul Railway passes through it. Its position on the shore of Beaverdam Lake makes it an attractive summer resort. It is the seat of Wayland University. Population (1900), 5128.

Beaver Falls, a borough of Beaver county, S. II. — 24

Pennsylvania, U.S.A., situated in the western part of the state, on Beaver river, 30 miles north-west of Pittsburg, at an altitude of 784 feet, on the Pennsylvania and the Pittsburg and Lake Erie Railways. It is in the coal and natural gas region and has extensive manufactures. It is the seat of Geneva College. Population (1900), 10,054.

Beawar, a town of British India, the administrative headquarters of Merwara district in Rajputana, situated in 26° 9' N. lat. and 74° 23' E. long., 33 miles from Ajmer. Population, about 20,000. It is an important centre of trade, especially in raw cotton, and has four factories for ginning and pressing cotton, two of which are worked by hydraulic pressure.

Bebel, Ferdinand August (1840—), German socialist, was born at Cologne on the 22nd of February 1840; he became a turner and worked at Leipzig. Here he took a prominent part in the workmen's movement and in the association of working men which had been founded under the influence of Schultz-Delitzsch; at first an opponent of socialism, he came under the influence of Liebknecht, and since 1865 he has been a confirmed advocate of socialism. With Liebknecht he belonged to the branch of the socialists which was in close correspondence with Karl Marx and the International, and refused to accept the leadership of Schweitzer, who had attempted to carry on the work after Lassalle's death. He was one of those who supported a vote of want of confidence in Schweitzer at the Eisenach conference in 1867, from which his party was generally known as "the Eisenacher." In this year he was elected a member of the North German Reichstag for a Saxon constituency, and, with the exception of the years 1881 to 1883, has been a member of the German Parliament ever since. His great organizing talent and oratorical power quickly made him one of the leaders of the socialists and their chief spokesman in parliament. In 1870 he and Liebknecht were the only members who did not vote the extraordinary subsidy required for the war with France; the followers of Lassalle, on the other hand, voted for the Government proposals. He was the only Socialist who was elected to the Reichstag in 1871, but he used his position to protest against the annexation of Alsace-Lorraine and to express his full sympathy with the Paris Commune. Bismarck afterwards said that this speech of Bebel's was a "ray of light," showing him that Socialism was an enemy to be fought against and crushed; and in 1872 Bebel was accused in Brunswick of preparation for high treason, and condemned to two years' imprisonment in a fortress; and, for insulting the German emperor, to nine months' ordinary imprisonment. After his release he helped to organize, at the Congress of Gotha, the united party of Social Democrats, which had been formed during his imprisonment. After the passing of the Socialist Law he continued to show great activity in the debates of the Reichstag, and was also elected a member of the Saxon Parliament; when the state of siege was proclaimed in Leipzig he was expelled from the city, and in 1886 condemned to nine months' imprisonment for taking part in a secret society. Although the rules of the Social Democratic party do not recognize a leader or president, Bebel has since been by far the most influential member of the party. In the party meetings of 1890 and 1891 his policy was severely attacked, first by the extremists, the "young" Socialists from Berlin, who wished to abandon parliamentary action; against these Bebel won a complete victory. On the other side he was involved in a quarrel with Volmar and his school, who desired to put aside from immediate consideration the complete attainment of the Socialist ideal, and proposed that the party should aim at bringing about, not a com-

plete overthrow of society, but a gradual amelioration. The conflict of tendencies then begun has continued, and Bebel has come to be regarded as the chief exponent of the traditional views of the orthodox Marxist party. He has been exposed to some natural ridicule on the ground that the "Kladderadatsch," which he often spoke of as imminent, has not yet taken place. On the other hand, though a strong opponent of militarism, he has publicly stated that foreign nations attacking Germany must not expect the help or the neutrality of the Social Democrats. His book, *Die Frau und der Socialismus*, which has gone through many editions, and contains an attack on the institution of marriage, has identified him with the most extreme forms of Socialism.

(J. W. HE.)

Beccles, a municipal borough, market town, and railway station, in the Lowestoft parliamentary division of Suffolk, England, on the Waveney, 10 miles W. by S. of Lowestoft. The corporation is lord of the manor and principal landowner. There are now extensive printing works and a hospital. Area of borough (a parish), 2017 acres; population (1881), 5721; (1891), 6669; (1901), 6898.

Bechuanaland, a country of British South Africa, which occupies all the central part of the great inland plateau, stretching from the Orange River uninterruptedly northwards to the Zambezi, and merging gradually westwards in the Kalahari desert. It is thus coterminous on the east with Orange River Colony, Transvaal, and Rhodesia, and on the west with German South-West Africa,

Tribal Groups.	Territory.	Area in Square Miles.	Population.	Chief Kraals.
<i>Batlaro</i> and <i>Basamaka</i> (totem, <i>Klu</i> , the Elephant); chief, Mankoroane	From Griqualand West to Kuruman and Taungs	30,000	60,000	Kuruman
<i>Batlapi</i> , (totem, <i>Tlapi</i> , the Fish); chief, Mankoroane	Between Taungs and Vryburg	Taungs
<i>Barolong</i> (totem, <i>Mari</i> , the Buffalo); chief, Montsioa	Between Vryburg and Molopo river	20,000	30,000	Mafeking
TOTAL, SOUTH BECHUANALAND.		50,000	90,000	
<i>Barwanketsi</i> (totem, <i>Kwena</i> , the Crocodile); chief, Bathoen	From the Molopo to the Kanya district	50,000	100,000	Kanya
<i>Bakwena</i> (totem, <i>Kwena</i>); chief, Sebele	From Kanya to Tropic of Capricorn			Formerly Kolobeng, now Molepolole
<i>Bamangwato</i> and <i>Batwana</i> (totem <i>Puti</i> , the duiker Antelope); chiefs, Khama and Secohome	From Sebele's to the Zambezi and westwards to and beyond Lake Ngami	150,000	400,000	Formerly Shoshong, now Palapye
TOTAL, NORTH BECHUANALAND.		200,000	500,000	

where the conventional boundaries, as laid down by the Anglo-German agreements of 1884 and 1890, coincide partly with 20° and partly with 21° E. Gr. This region, which enjoys almost complete ethnical unity, being mainly inhabited by various branches of the great Bechuanaland nation, is divided politically into two sections—*South Bechuanaland*, from the Orange to the Molopo river, forming since

1895 an integral part of Cape Colony; and *North Bechuanaland*, from the Molopo to the Zambezi, since 1885 a British protectorate. In both sections the natives retain their primitive tribal organization, with their hereditary chiefs, totems (tutelar deities), recognized territories, and head kraals (stations), as tabulated above.

Here the areas include extensive hunting grounds claimed by the several tribes in the Kalahari desert, and in the populations are comprised some thousands of the so-called Ba-Kalahari, *i.e.*, Bushman half-breeds, formerly slaves, now servants and farm assistants of their Bechuana masters. The emancipation of these debased Bushman groups was one of the most beneficent results of the extension of British rule over Bechuanaland. Khama, the central figure if not the recognized paramount chief of the Bechuana nation, has long administered his extensive territory and controlled his formerly lawless Bamangwato subjects with a vigour combined with kindness which would reflect credit on any European potentate. In this Christian prince are embodied all the higher qualities of which the Bantu race is capable, and he, with Moshesh, Chaka, and a few others, has been appealed to in proof of the mental superiority of the Negroid Bantus over the full-blood Sudanese negro. In the protectorate the three chiefs, Khama, Sebele, and Bathoen, continue to govern their own people under the protection of Great Britain, which is represented by a Resident Commissioner stationed at the administrative capital, Mafeking, and acting under the High Commissioner of South Africa. The natives pay a hut-tax, which is collected by the chiefs, and order is maintained by a force of mounted police. The people are occupied chiefly with stock-breeding, and in recent years have suffered greatly from drought and rinderpest. In consequence of these losses the expenditure has in some years greatly exceeded the revenue (in 1897, £88,450 and £47,510 respectively); but in normal times accounts are balanced, and the population appears to be increasing. Khama had always forbidden the importation of spirits in his territory, and at present no licenses are granted for their sale in any part of the protectorate. For the physical features, climate, and other geographical details, see *SOUTH AFRICA*.

J. D. HEPBURN. *Twenty Years in Khama's Country*. London, 1895.—SIR HARRY JOHNSTON. *The Colonization of Africa*. Cambridge, 1899.—A. H. KEANE. *Africa*, vol. ii. London, 1895.

(A. H. K.)

Recent History.—With the settlement of Dr Livingstone in the country in the early 'forties, the political history of Bechuanaland may be said to begin. In 1852 a trader named M'Cabe was stopped by the Boers whilst crossing the Kalahari. This satisfied Livingstone that the Boers were endeavouring to close the country to British colonization. "The Boers," he wrote, "resolved to shut up the interior, and I determined to open the country." At this time the Boers attacked Setylli, a tribal chief, and tried to induce Montsioa, chief of the Barolong, to assist them, but he refused to be drawn into the strife. At a later date they tried to raise taxes from the Barolong, but without success. This led to a protest from Montsioa, which he lodged with a landdrost at Potchefstroom in the Transvaal, threatening to submit the matter to the British High Commissioner if any further attempt at taxation were made on the part of the Boers. The Boers then resorted to cajolery, and invited the Barolong to join their territories with the Transvaal, in order to save them from becoming British. Montsioa's reply was short: "No one ever spanned in an ass with an ox in one yoke." These overtures of the freebooting parties of Boers having failed, the president of the Transvaal in 1872 endeavoured to replace Montsioa as chief of the Barolong by Moshette, whom he declared to be the rightful ruler and

paramount chief of that people. The attacks of the Boers at length became so unbearable that Montsioa made a request to the British authorities to be taken under their protection. In formulating this appeal he declared that when the Boers were at war with Moselekatze, chief of the Matabele, he had aided them on the solemn undertaking that they were to respect his boundaries. This promise they had broken. Khama, chief of the Bamangwato in Northern Bechuanaland, wrote about the same time to Sir Henry Barkly making an appeal similar to that sent by the Barolong. The letter, which is a remarkable one, contained the following significant passages: "I write to you, Sir Henry, in order that your queen may preserve for me my country, it being in her hands. The Boers are coming into it, and I do not like them." "Their actions are cruel among us black people. We are like money, they sell us and our children." "I ask Her Majesty to defend me, as she defends all her people. There are three things which distress me very much—war, selling people, and drink. All these things I shall find in the Boers, and it is these things which destroy people to make an end of them in the country. The custom of the Boers has always been to cause people to be sold, and to-day they are still selling people." The statements of Khama in this letter do not appear to have been exaggerated. The testimony of Livingstone confirms them, and even a Dutch clergyman, writing in 1869, described the system of apprenticeship of natives which obtained among the Boers "as slavery in the fullest sense of the word." These representations on the part of the Barolong, and the Bamangwato under Khama, supported by the representations of Cape politicians, led in 1878 to the military occupation of Southern Bechuanaland by a British force under Colonel Warren. The imperial troops at Warren's disposal, with the Kimberley volunteers, were able to check the Boers in the district at that time. With regard, however, to the indignant protests that were made by missionaries and travellers on the subject of Boer cruelty towards the natives, it is only fair to say that at the outset, in a large number of instances, the Boers' aid was called in by one or other native chief, a party to the tribal strife continually raging among the Bantu. In fact what occurred in Bechuanaland occurred more or less throughout South Africa. A continual struggle for power was going on amongst petty Bantu chieftains, who did not hesitate to call in any allies they could obtain. Thus in 1881 Massow invited the aid of the Boers against Mankoroane, who claimed to be paramount chief of Bechuanaland. The Transvaal war of that date offered opportunities to the freebooting Boers of the west which were not to be lost. Once having entered upon the scene of internal native warfare, the Boers continued their interference until Montsioa himself became involved, the Boers professing to support the claims of Moshette.

At this time the British forces were too much occupied with the Boers themselves to be able to respond to native appeals for help. Consequently the Boers proceeded without let or hindrance with their *Stellaland and Goshen*. 1882 they set up the republic of Stellaland, with Vryburg as its capital, and forthwith proceeded to set up the republic of Goshen, farther north, in spite of the protests of Montsioa, and established a small town called Rooi Grond as capital. They then summoned Montsioa to quit the territory. The efforts of the British authorities at this period (1882-83) to bring about a satisfactory settlement were feeble and futile, and fighting continued until peace was made entirely on Boer lines. The Transvaal Government was to have supreme power, and to be the final arbiter in case of future quarrels arising among

the native chiefs. This agreement, arrived at without any reference to the British Government, was a breach of the Pretoria Convention, and led to an intimation on the part of Great Britain that she could not recognize the new republics. In South Africa, as well as in England, strong feeling was aroused by this act of aggression. Unless steps were taken at once, the whole of Bechuanaland might be permanently lost, while German territory on the west might readily be extended to join with that of the Boers. In the London Convention of 1884, conceded by Lord Derby in response to the overtures of Boer delegates, the Transvaal boundaries were defined, but in spite of this convention the Boers remained in Bechuanaland, and at length the Rev. John Mackenzie, who had succeeded Livingstone, was sent to the country to arrange matters. He found very little difficulty in negotiating with the various Bechuana chiefs, but with the Boers he was not so successful. In Goshen the Boers defied his authority, while in Stellaland only a half-hearted acceptance of it was given. He was then recalled by Sir Hercules Robinson, and Mr Rhodes succeeded him as deputy commissioner of Bechuanaland.

Mr Rhodes's mission was attended with great difficulty. British prestige after the disastrous Boer war of 1881 was at a very low ebb, and he realized that he could not count on any active help from the imperial or colonial authorities. He adopted a tone of conciliation, and decided that the Stellaland republic should remain under a sort of British suzerainty. But in Goshen the Boers would let him do nothing. Joubert, after meeting him at Rooi Grond, entered the country and attacked Montsioa. Mr Rhodes then left under protest, declaring that the Boers were making war against Great Britain. The Boers now proclaimed the country Transvaal territory. This was a breach of the London Convention, and Mr Kruger explained that the steps had been taken in the "interests of humanity." Indignant protest in Cape Town and throughout South Africa, as well as England, led to the despatch in October 1884 of the Warren Expedition, which was sent out by the British Government to remove the filibusters, to bring about peace in the country, and to hold it until further measures were decided upon. Mr Kruger met Sir Charles Warren's force at the Modder river, and endeavoured to stop him from proceeding farther, saying that he would be responsible for keeping order in the country. Warren, however, proceeded with his mission, and broke up the republics of Stellaland and Goshen. Bechuanaland was formally taken under British protection, and the sphere of British influence was declared to extend to the 22nd parallel of latitude.

The natives cheerfully accepted this new departure in British policy, and from this time forward Khama's country was known as the British Protectorate of Bechuanaland. That portion lying to the south of the Molopo river was described as *British Bechuanaland*, and was constituted a crown colony. In 1890 the northern portion also passed under the control of the governor of British Bechuanaland, Sir Sidney Shippard, a protest being made at the time by the British South Africa Company, on the ground that it was included in the sphere of their charter. Under the able administration of Sir Sidney Shippard peace was maintained among the natives, who have shown great loyalty to British rule.

A review of the history of the country down to this date shows how much has been due to the efforts of men like Livingstone, Mackenzie, and Rhodes. It is quite clear that had they not represented the true state of affairs to the authorities the whole of this territory would have gradually been absorbed by the Boers, until they had effected a union with the Germans on the west. The

great trade route to the north—the "Suez Canal of South Africa," as Mr Rhodes called it—would thus have been effectually shut against trade and British colonization. With regard to the precise effect of missionary influence upon the natives, opinion will always remain divided. But Livingstone, who was not only a missionary but also an enlightened traveller, stated that a considerable amount of benefit had been conferred upon the native races by missionary teaching. Livingstone was a great advocate of the prohibition of alcohol among the natives, and that policy has always been adhered to by Khama.

In 1891 the Customs Union was extended to British Bechuanaland, and in 1895 the country was annexed to Cape Colony. At the same time it was provisionally arranged that the Bechuanaland protectorate should pass under the administration of the British South Africa Company. On learning what was going on, Khama and two other Bechuana chiefs came to England and protested against this arrangement. The result was that their territories and those of other petty chiefs lying to the north of the Molopo were made native reserves, into which the importation of liquor was forbidden. A British resident officer was to be appointed to each of the reserves. A stipulation, however, was made with these chiefs that a strip of country sufficient for the purposes of the Matabeleland railway should be conceded to the Chartered Company. In December 1895, the occurrence of the Jameson Raid, an expedition which started from these territories, prevented the completion of negotiations, and the whole of Northern Bechuanaland still remains a British protectorate. The two chief towns in British Bechuanaland are Mafeking and Vryburg, Palapye being the chief town in the protectorate. The railway is now extended throughout the entire length of the country, and up to Bulawayo in Rhodesia. Material progress during the last few years in Bechuanaland has not been great, owing to disturbed political conditions, but there is little question that as a grazing country, and also possibly for agricultural and mineral purposes, the country has a promising future.

Beckenham, a parish and urban district in the Sevenoaks parliamentary division of Kent, England, 10 miles S. of London by rail. Although one of the more remote outlying districts around London, it has found great favour as a place of residence among City business men, and has changed from a village to a rapidly-growing modern town. It still retains many of its rural characteristics, and has wide thoroughfares and many handsome residences standing in extensive grounds. It has adopted electric lighting and public baths. Population of urban district (area, 3881 acres) (1881), 13,045; (1891), 20,707; (1901), 26,330.

Beckx, Petrus Johannes (1795-1887), twenty-second General of the Jesuits, was born at Sichein, near Louvain in Belgium, on 5th February 1795, and was admitted to the Society of Jesus at Hildesheim in 1819. In 1826 the conversion of Duke Ferdinand and Duchess Julia of Anhalt-Köthen (daughter of Frederick William II. of Prussia) to the Roman Catholic faith produced a great sensation in Germany; and it was a proof of Father Beckx's reputation that he was recommended by the General of the Order as their confessor. On the death of the duke he accompanied the duchess to Vienna, where he acquired great influence over the highest persons of the state, and in particular over Metternich.

On the expulsion of the Jesuits in 1848 he became rector of the college of Louvain; but in 1852 was recalled to Austria, and became Superior for Hungary, to which office was soon added that of Provincial of Austria. It was greatly owing to his exertions that the Primate of Hungary, Cardinal Szczitowski, obtained the revocation of the edict of 1848, expelling the Jesuits from Hungary. In 1853 Father Beckx attended the General Assembly of the Jesuits at Rome, where on 2nd July he was elected General of the Order in succession to Father Roothaan, by twenty-seven votes against sixteen given for Father Pierling. In 1883, owing to his great age, he received the assistance of Father Anderledy, vicar-general, and in the following year resigned to him the office of General. During his long tenure of the post (only exceeded by one of his predecessors, Claudio Acquaviva), he had seen the Jesuits emerge triumphant from the disasters of 1848; and they had proved too strong even for so formidable a foe as Bismarck. This success was largely the work of Father Beckx, whose combination of energy and tact, as well as his personal piety, gave him a preponderant influence in the Church. Pius IX. in particular placed unbounded confidence in him. He died at Rome on 4th March 1887. His *Month of Mary*, published anonymously in 1838, ran through many editions, and was translated into most of the European languages (English edition, 1883). He was also joint-author of the *Köthen Prayer-Book*, another work that obtained the widest circulation. But his literary activity was chiefly confined to the Jesuit organ, *Civiltà Cattolica*, of which he was the founder and director.

(H. Sx.)

Bedford, a municipal and parliamentary borough (co-extensive and returning one member), market town, and county town of Bedfordshire, England, on the Ouse, 50 miles N.N.W. of London by rail. New buildings at the Grammar School were erected in 1891 at a cost of £25,000. In 1900 a further separate building for younger boys was opened, and there have also been recently erected admirably-equipped carpentering, engineering, and other workshops. The chemical and physical laboratories, gymnasium, &c., have been fitted out with every modern convenience and appliance. The number of scholars at the end of 1900 was 876. The Harpur Trust also governs a modern school with (1900) 508 boys, a high school with 538 girls, a modern school with 213 girls, and elementary schools with 1975 children. This last figure was formerly much larger, but three board schools, providing accommodation for 2670 children (1901), have been opened in order to relieve the Trust. Technical classes under the control of the county council are also conducted in the town. The old grammar school buildings have been turned into a town hall, &c. Modern structures include the barracks (£50,000), the corn exchange, the shire hall (rebuilt at a cost of £20,000), a suspension bridge, a theatre, and the county hospital (£34,000). The Bedford rooms are now used as a library. There are statues of John Bunyan (1874) and of John Howard, the philanthropist (1894). Bunyan Meeting, a chapel on the site of that in which the former preached, has interesting memorials of its founder. The corporation owns the markets and the water supply, and provides electric light. The water supply from the present sources being insufficient to meet the growing demands of the town, a scheme was proposed in 1901 for bringing water from Henlow, 12 miles distant. A provisional order to construct and work tramways has been granted to the corporation. A public park of 61 acres was opened in 1888, and another of 23 acres in 1894. Large engineering works have also been erected. Pillow-lace making in the neighbourhood is almost extinct. Area, 2200

acres; population (1881), 19,532; (1891), 28,023; (1901), 35,144.

Bedford, a city of Indiana, U.S.A., capital of Lawrence county, in the southern part of the state, at the intersection of three railways. It has extensive stone quarries. Population (1900), 6115.

Bedfordshire, a south midland county of England, is bounded on the N. by Huntingdon, on the N.W. by Northampton, on the W. by Buckingham, on the S. by Hertford, and on the E. by Hertford and Cambridgeshire.

Area and Population.—According to the census returns of 1891 the area of the ancient and administrative county was 298,494 acres, or 466 square miles, with a population in 1881 of 149,473, and in 1891 of 160,704, of whom 75,477 were males, and 85,227 females, the number of persons to a square mile being 345, and of acres to a person 1.86. Since 1891 the area of the administrative county has undergone various alterations. In 1896 the parish of Swineshead was transferred from Huntingdon to Bedford, and the parish of Tilbrook from Bedford to Huntingdon; and in 1897 a part of the parish of Caddington, and the parishes of Kensworth and Studham, were transferred from Hertford to Bedford, and the hamlet of Humbershoe, part of the parish of Houghton Regis, the parish of Holywell, and parts of the parish of Shillington, from Bedford to Hertford. The area of the registration county is 309,989 acres, with a population in 1891 of 165,999, of which 74,189 were urban, and 91,810 rural. Within this area the increase of population between 1881 and 1891 was 7.59 per cent. Between 1881 and 1891 the excess of births over deaths was 21,383, but the increase in the resident population was only 11,713. In 1901 the population was 171,699. The following table gives particulars as to births, deaths, and marriages in 1880, 1890, and 1899:—

Year.	Marriages.	Births.	Deaths.	Illegitimate births.	
				Males.	Females.
1880	975	5008	3064	191	189
1890	1052	4597	2667	139	125
1898	1298	4423	2697	113	107

In 1899 the number of marriages was 1213, of births 4328, and of deaths 2858.

The following table gives the marriage-, birth-, and death-rates per thousand of the population, with the percentage of illegitimate births, for a series of years:—

	1870-79.	1880.	1880-89.	1890.	1888-97.	1898.
Marriage-rate .	14.1	12.6	13.5	12.1	13.5	14.9
Birth-rate .	33.7	32.4	31.2	27.8	27.3	25.4
Death-rate .	19.6	19.8	17.7	16.2	16.0	15.5
Percentage of illegitimacy .	7.2	7.6	6.6	5.7	5.5	5.0

Both the birth-rate and the death-rate were below those of England. In 1891 there were in the county 658 natives of Scotland, 663 natives of Ireland, and 316 foreigners.

Constitution and Government.—The county is divided into two parliamentary divisions, and also includes the parliamentary borough of Bedford returning one member. There are three municipal boroughs; Bedford, Dunstable, and Luton. The urban districts are Amptill, Biggleswade, Kempston, and Leighton-buzzard. The county is in the Midland circuit, and assizes are held at Bedford. The boroughs of Bedford, Dunstable, and Luton have separate commissions of the peace, and Bedford has in addition a separate court of quarter sessions. The ancient county, which forms an archdeanery in the diocese of Ely, contains 125 ecclesiastical parishes and districts, and parts of 6 others.

Education.—The number of elementary schools on 31st August 1899 was 156, of which 69 were board schools and 87 voluntary, the latter including 80 National Church of England schools, 3 Wesleyan, 1 Roman Catholic, and 3 "British and other." The average attendance at board schools was 13,315, and at voluntary schools 14,019. The total school board receipts for the year ending 29th September 1899 were over £47,247. The income under the Technical Instruction Act was over £8, and that under the Agricultural Rates Act was over £1550.

Agriculture.—About nine-tenths of the total area of the county is under cultivation. Of the corn crops, which still occupy an exceptionally large area, wheat is still the chief, although its area within the last 25 years has diminished more than a third. Potatoes and turnips occupy an almost equal area, but the area of

the former is gradually increasing. The following table gives the principal acreages at intervals of five years from 1880 :—

Year.	Area under crops.	Corn crops.	Green crops.	Clover.	Perma- nent pasture.	Fallow.
1880	260,875	109,878	31,810	20,696	81,090	16,901
1885	260,298	101,026	35,283	22,795	87,944	13,250
1890	259,396	99,350	29,932	21,028	96,703	12,203
1895	254,997	89,571	29,813	22,317	99,773	13,235
1900	257,346	88,043	31,752	26,471	102,794	7,954

The following table gives particulars regarding the live stock for the same years :—

Year.	Total horses.	Total cattle.	Cows or heifers in milk or in calf.	Sheep.	Pigs.
1880	12,082	31,552	10,751	152,084	28,526
1885	11,882	37,525	12,137	151,813	32,545
1890	11,665	33,467	12,233	121,994	33,958
1895	12,103	30,023	11,092	96,278	32,826
1900	11,991	34,833	11,876	104,759	25,280

Industries and Trade.—According to the report of the inspector of factories for 1898 (1900), there were no persons employed in textile factories, while 6383 were employed in non-textile factories, and 6783 in workshops. Between 1895 and 1896 there was an increase of 7·4 per cent. in the number of persons employed in non-textile factories, and between 1896 and 1897 an increase of 15·8. Of those employed in workshops no fewer than 5901 are in the "returns" stated to be employed in "clothing." This includes chiefly those employed in the point pillow lace manufacture, which is an extensive female industry, and in the straw plait manufacture carried on mainly at Luton and Dunstable. In the manufacture of machines, conveyances, tools, etc., nearly 2300 persons are employed, there being at Bedford extensive agricultural implement and engineering works. In 1899, 611,745 tons of chalk were raised, 166,829 tons of clay, and 78,420 tons of gravel and sand.

Beecher, Henry Ward (1813-1887), American preacher and reformer, was born in Litchfield, Connecticut, 24th June 1813. He was the ninth child of Lyman and Roxana Foote Beecher, and brother of Harriet Beecher Stowe. Entering Amherst College in 1830, he gave more attention to his own courses of reading than to college studies, and was more popular with his fellows than with the faculty. With a patience foreign to his impulsive nature, he submitted to minute drill in elocution, and became a fluent extemporaneous speaker. Reared in a Puritan atmosphere, he has graphically described the mystical experience which, coming to him in his early youth, changed his whole conception of theology and determined his choice of the ministry. "I think," he says, "that when I stand in Zion and before God, the highest thing that I shall look back upon will be that blessed morning of May, when it pleased God to reveal to my wondering soul the idea that it was His nature to love a man in his sins for the sake of helping him out of them." In 1837 he graduated from Lane Theological Seminary in Ohio, of which his father was president, and entered upon his work as pastor of a missionary Presbyterian church at Lawrenceburg, a village on the Ohio, a few miles below Cincinnati. The membership numbered nineteen women and one man. Mr Beecher was sexton as well as preacher. Two years later he accepted a call to Indianapolis. His unconventional preaching shocked the more staid members of the flock, but

filled the church to overflowing with people unaccustomed to churchgoing. He studied men rather than books; became acquainted with the vices in what was a pioneer town; and in his *Sermons to Young Men* treated these with genuine power of realistic description and with youthful and exuberant rhetoric. Eight years later (1847) he accepted a call to the pastorate of Plymouth church (Congregational), then newly organized in Brooklyn, New York. The situation of the church, within five minutes' walk of the chief ferry to New York, the stalwart character of the men who had organized it, and the peculiar eloquence of Mr Beecher, combined to make the pulpit a national platform. The audience-room of the church, capable of seating 2000 or 2500 people, frequently contained 500 or 1000 more.

Mr Beecher at once became a recognized leader. On the all-absorbing question of slavery he took a middle ground between the pro-slavery or peace party, and abolitionists like William Lloyd Garrison and Wendell Phillips, believing, with such statesmen as W. H. Seward, S. B. Chase, and Abraham Lincoln, that slavery was to be overthrown under the constitution and in the Union, by forbidding its growth and trusting to an awakened conscience, enforced by an enlightened self-interest. He was always an anti-slavery man, but never technically an abolitionist. In the earlier days of the agitation, he challenged the hostility which often mobbed the anti-slavery gatherings; in the later days he consulted with the political leaders, inspiring the patriotism of the North, and sedulously setting himself to create a public opinion which should confirm and ratify the emancipation proclamation whenever the President should issue it. When danger of foreign intervention cast its threatening shadow across the national path, he went to England, and by his famous addresses did what probably no other American could have done to strengthen the spirit in England favourable to the United States, and to convert the doubtful and the hostile. For a little while he acted as one of the editors of the *Independent*, then a Congregational newspaper; and his editorials, copied far and wide, produced a profound impression on the public mind by clarifying and defining the issue. Later, he founded and became editor-in-chief of the *Christian Union*, afterwards the *Outlook*, a weekly religious undenominational newspaper. His lectures and addresses had the spirit if not the form of his sermons, just as his sermons were singularly free from the homiletical tone. Yet his work as a reformer was subsidiary to his work as a preacher. He was not indeed a parish pastor; he inspired church activities which grew to large proportions, but trusted the organization of them to laymen of organizing abilities in the church; and for acquaintance with his people he depended on such social occasions as were furnished in the free atmosphere of this essentially New England church at the close of every service, but during his pastorate the church grew to be probably the largest in membership in the United States.

It was in the pulpit that Mr Beecher was seen at his best. His mastery of the English tongue, his dramatic power, his instinctive art of impersonation, which had become a second nature, his vivid imagination, his breadth of intellectual view, the catholicity of his sympathies, his passionate enthusiasm, which made for the moment his theme seem to him the one theme of transcendent importance, his quaint humour alternating with genuine pathos, and above all his simple and singularly unaffected devotional nature, made him as a preacher without a peer in his own time and country. His favourite theme was love; love to man was to him the fulfilment of all law; love of God was the essence of all Christianity. Retaining to the day of his death the forms and phrases of the New England theology in which he

had been reared, he poured into them a new meaning, and gave to them a new significance. He probably did more than any other one man in America to lead the Puritan churches from a faith which regarded God as a moral governor, the Bible as a book of laws, and religion as obedience to a conscience, to a faith which regards God as a Father, the Bible as a book of counsels, and religion as a life of liberty in love. The later years of his life were darkened by a scandal which Mr Beecher's personal, political, and theological enemies used for a time effectively to shadow a reputation previously above reproach. But in the midst of these accusations the largest and most representative Congregational council ever held in the United States, gave expression to a vote of confidence in him, which time has absolutely justified. It is safe to say that the verdict of history will class this scandal with the somewhat similar, but more excusable one, respecting John Wesley. Not a student of books nor a technical scholar in any department, Mr Beecher's knowledge was as wide as his interests were varied. He was early familiar with the works of Matthew Arnold, Charles Darwin, and Herbert Spencer; he preached his *Bible Studies* sermons in 1878, when the higher criticism was wholly unknown to most evangelical ministers or known only to be dreaded; and his sermons on *Evolution and Religion* in 1885, when many of the ministry were denouncing evolution as atheistic. He was stricken with apoplexy while still active in the ministry, and died at Brooklyn on Tuesday, 8th March 1887, in the seventy-fourth year of his age.

The principal books by Mr Beecher, besides his published sermons, are: *Seven Lectures to Young Men*, 1844. *Plymouth Collection of Hymns and Tunes*, 1855. *Star Papers, Experiences of Art and Nature*, 1855. *Life Thoughts*, 1858. *Views and Experiences of Religious Subjects*, 1858. *Plain and Pleasant Talks about Fruits, Flowers, and Farming*, 1859. *Speeches on the American Rebellion—Manchester, Glasgow, Edinburgh, Liverpool, and London*, 1864. *Prayers from Plymouth Pulpit*, 1867. *Norwood: A Tale of Village Life in New England*, 1867. *The Life of Jesus the Christ*, 2 vols., 1871. *Yale Lectures on Preaching*, 3 vols., 1872-74.

The principal lives of Mr Beecher are: *Henry Ward Beecher: A Sketch of His Career*. By LYMAN ABBOTT and S. B. HALLIDAY, 1888.—*Beecher: Christian Philosopher, Pulpit Orator, Patriot, and Philanthropist*. By T. W. HANDFORD, 1887.—*Life of Henry Ward Beecher*. By JOSEPH HOWARD, Jr., 1887.—*A Biography of Henry Ward Beecher*. By WILLIAM C. BEECHER, Rev. SAMUEL SCOVILLE, and Mrs H. W. BEECHER.—*Henry Ward Beecher*. By JOHN HENRY BARROWS, 1893.—*Henry Ward Beecher: a Study*. By JOHN R. HOWARD, 1891.—*The Boyhood of Henry Ward Beecher*. By FRANK S. CHILD (Pamphlet), 1897.—*The History of Plymouth Church*. By NOYES L. THOMPSON, 1847-72.—*The Life and Work of Henry Ward Beecher*. By THOMAS W. KNOX. (L. A.)

Beechworth, a beautifully situated town in the county of Bogong, Victoria, Australia, with a station 172 miles by rail N.E. of Melbourne. It is the chief town of the Ovens goldfields, on which over 5000 miners are employed. The town has several churches and various public buildings, including a good library and museum. Mean temperature for the year, 55.2° F.; for January, 69.7° F.; for July, 41.0° F. Mean rainfall (4 years), 29.29 inches. Population (1891), 2528; (1901), 7359.

Beer. See BREWING.

Beets, Nikolaas (1814—), Dutch poet, was born at Haarlem on the 13th of September 1814; constant references in his poems and sketches show how deeply the beauty of that town and its neighbourhood impressed his imagination. He studied theology in Leyden, but gave himself early to the cultivation of poetry. In his youth Beets was entirely carried away on the tide of Byronism which was then sweeping over Europe, and his early works—*Jose*, 1834; *Kuser*, 1835; and *Guy de Vlamming*, 1837—are gloomy romances of the most impassioned type. But at the very same time he was beginning in prose

the composite work of humour and observation which has made him famous, and which certainly had nothing that was in the least Byronic about it. This was the celebrated *Camera Obscura* (1839), the most successful imaginative work which any Dutchman of this century has produced. This work, published under the pseudonym of "Hildebrand," goes back in its earliest inception to the year 1835, when Beets was only twenty-one. It consists of complete short stories, descriptive sketches, studies of peasant life—all instinct with humour and pathos, and written in a style of great charm; it has been reprinted in countless editions. Beets became a professor at the University of Leyden, and the pastor of a congregation in that city. In middle life he published further collections of verse—*Cornflowers*, 1853, and *New Poems*, 1857—in which the romantic melancholy was found to have disappeared, and to have left in its place a gentle sentiment and a depth of religious feeling. In 1873-75 Beets collected his works in three volumes. In April 1883 he visited Scotland, when the honorary degree of LL.D. was conferred upon him by the University of Edinburgh.

Begas, Reinhold (1831—), German sculptor, the son of Karl Begas, a distinguished painter, was born at Berlin on 15th July 1831. He received his early education (1846-51) in the ateliers of Rauch and Wichmann. During a period of study in Italy, from 1856-1858, he was influenced by Böcklin and Lenbach in the direction of a naturalistic style in sculpture. This tendency was marked in the group "Borussia," executed for the façade of the Exchange in Berlin, which first brought him into general notice. In 1861 he was appointed professor at the Art School in Weimar, but retained the appointment only a few months. That he was chosen, after competition, to execute the statue of Schiller for the Gendarmen Markt in Berlin, was a high tribute to the fame he had already acquired; and the result, one of the finest statues in the German metropolis, entirely justified his selection. Since the year 1870, Begas has entirely dominated the plastic art in Prussia, but especially in Berlin. Among his chief works during this period are the colossal statue of Borussia for the Hall of Glory; the Neptune fountain in bronze on the Schlossplatz; the statue of Alexander von Humboldt, all in Berlin; the sarcophagus of the Emperor Frederick III. in the mausoleum of the Friedenskirche at Potsdam; and, lastly, the national monument to the Emperor William (see BERLIN), the statue of Bismarck before the Reichstag Gebäude, and several of the statues in the Siegesalle. He was also entrusted with the execution of the sarcophagus of the Empress Frederick.

Bègles, a suburban town in the department of Gironde, France, 3 miles S.S.E. of Bordeaux, on the railway from Bordeaux to Cette. The principal manufactured products are chemicals, artificial manure, soap, and candles; and fish-curing is an important industry. Population (1881), 7238; (1896), 10,372.

Behar, or BIHAR, a town of British India, in the Patna district of Bengal, which gives its name to an old province, situated on the right bank of the river Panchana. Population (1881), 48,968; (1891), 47,723; (1901), 44,894. There are still some manufactures of silk and muslin, but trade has deserted Behar in favour of Patna, and other places more favourably situated on the river Ganges and the railway. The old province, stretching widely across the valley of the Ganges from the frontier of Nepal to the hills of Chota Nagpur, corresponds to the two administrative divisions of Patna and Bhagalpur, with a total area of 44,197 square miles, population of 23,127,104, and a land revenue of Rs.1,425,876, or nearly one million sterling. It is the most densely populated

tract in India, and, therefore, always liable to famine; but it is now well protected almost everywhere by railways. It is a country of large landholders, and also of indigo planters. The vernacular language is not Bengali, but a dialect of Hindi; and the people likewise resemble those of Upper India.

Beira, a region of Portugal, formerly divided between the provinces of Beira Alta and Beir Baixa, but now comprised within the districts of Vizeu (answering to the former), and Guarda and Castello Branco (corresponding to the latter).

Beira (town). See EAST AFRICA, PORTUGUESE.

Beirút, or BEYROUT. (1) A viláyet of Syria which stretches along the sea-coast from Jebel el-Akra, south of the Orontes, to the Nahr Zerka, south of Mount Carmel, and towards the south extends from the Mediterranean to the Jordan. (2) The chief town of the viláyet, ancient *Berytus*, the most important sea-port town in Syria, situated on the south side of St George's Bay, on rising ground at the foot of Lebanon. Since the pacification of the Lebanon after the massacre of the Christians in 1860, Beirút has greatly increased in extent, and has become the centre of the transit trade for all Syria. In 1894 a small harbour, constructed by a French company, was opened, but the dues are so high that trade is being driven away to Haifa and Tripoli. In 1895 a French company completed a railway across the Lebanon to Damascus, and connected it with a line from Damascus to Mezeirib in the Haurán. In 1898 a portion of a railway from Beirút to Tripoli was opened. The town has been supplied with water, since 1875, by an English company, and with gas, since 1888, by a French company. There are many American and European institutions in the city: the American Presbyterian mission, with a girls' school and a printing office, which published the Arabic translation of the Bible, and now issues a weekly paper and standard works in Arabic; the Syrian Protestant college with its theological seminary, medical faculty, training college, and astronomical observatory; the Scottish mission, and St George's institute for Moslem and Druse girls; the British Syrian mission schools; the German Hospital, orphanage, and boarding school; the French hospital and schools, and the Jesuit "Université de St Joseph" with a printing office. The average value of the exports for the five years 1894-98 was £726,981, and of the imports £1,656,672. In 1898 the exports were £2600, and the imports £253,400 less than the average, the latter being £650,000 less than in 1894. Population, 120,000 (Moslems, 36,000; Christians, 77,000; Jews, 2500; Druses, 400; foreigners, 4100). (c. w. w.)

Beith, a market and manufacturing town of Ayrshire, Scotland, 18½ miles W.S.W. of Glasgow, with which it has two railway connexions. Modern erections are a Free Church, court house, and a post office. Beith is the centre of the West of Scotland cabinet-making industry. There is a good secondary school. Population (1891), 7126; (1901), 7523. The parish contains coal and ironstone mines, and trap, sandstone, and limestone quarries.

Beja, a town and episcopal see of Portugal, capital of district of the same name, 87 miles south-east from Lisbon. Population, 8394. The district of BEJA has an area of 4196 square miles, and population 157,751, giving thirty-seven inhabitants to the square mile. Pig-breeding is the chief industry. Copper, iron, and manganese are mined.

Bela, or LAS BELA, situated in 26° 27' 30" N. lat., and 66° 45' 0" E. long., 350 feet above sea level, capital of a small independent state to the south of Kalat (Baluchistan), ruled by the Jam (or Cham), who occupies the position of

a protected chief under the British Raj. To the east lies Sind, and to the west Makrán, and from time immemorial the great trading route between Sind and Persia has passed through Las Bela. The low-lying, alluvial, hot and malarial plains of Las Bela, occupying about 2000 square miles on the north-east corner of the Arabian Sea, are highly irrigated and fertile—two rivers from the north, the Poráli and the Kud, uniting to provide a plentiful water supply. The bay of Sonmiani once extended over most of these plains, where the Poráli delta is now growing with measurable strides. The hill ranges to the east parting the plains from Sind, generally known as Hala but, locally, as the Mor and the Kirthar, between which lies the long narrow line of the Hab valley, strike nearly north and south, diminishing in height as they approach the sea and allowing of a route skirting the coast between Karachi and Bela. To the west they are broken into an infinity of minor ridges massing themselves in parallel formation with a strike which curves from south to west till they form the coast barrier of Makrán. The Persian route, curving somewhat to the north, traverses this waste of barren ridges almost at right angles, but on dropping into the Kolwah valley its difficulty ceases. It then becomes an open road to Kej and Persia, with an easy gradient. This was undoubtedly one of the greatest trade routes of the mediæval days of Arab ascendancy in Sind, and it is to this route that Bela owes a place in history which its modern appearance and dimensions hardly seem to justify. Bela is itself rather prettily situated on a rocky site above the banks of the Poráli. About four miles to the south are the well-kept gardens which surround the tomb of Sir Robert Sandeman; which is probably destined to become a "ziarat," or place of pilgrimage, of even greater sanctity than that of General Jacob at Jacobabad. The population of the town numbers about 5000. The Jam's retinue consists of about 300 infantry, 50 cavalry, and 4 guns. Liability to assist on active service is the only acknowledgment of suzerainty which is paid by the Jam to the Khan of Kalat.

From very early times this remote corner of Baluchistan has held a distinct place in history. There are traces of ancient Arab (possibly Himyaritic) occupation to be found in certain stone ruins at Gondakeha on the Kud river, 10 miles to the north-west of Bela, whilst the Greek name "Arabia" for the Poráli is itself indicative of an early pre-historic connexion with races of Asiatic Ethiopians referred to by Herodotus. On the coast, near the village of Sonmiani (a station of the Indo-Persian telegraph line) may be traced the indentation which once formed the bay of Morontobara, noted in the voyage of Nearkos; and it was on the borders of Makrán that the Turanian town of Rhambakia was situated, which was once the centre of the trade in "bdellium." In the 7th century A.D. Las Bela was governed by a Buddhist priest, at which time all the province of Gandava was Buddhist, and Sind was ruled by the Brahman, Chach. Buddhist caves are to be found excavated in the conglomerate cliffs near Gondakeha, at a place called Gondráni, or Shahr-i-Rogan. With the influx of Arabs into Makrán, Bela, under the name of Armel (or Armabel), rose to importance as a link in the great chain of trading towns between Persia and Sind; and then there existed in the delta such places as Yusli (near the modern Uthal) and Kambali (which may possibly be recognized in the ruins at Khairokot), and many smaller towns, each of which possessed its citadel, its caravanserai and bazaar, which are not only recorded but actually mapped by one of the mediæval Arab geographers, Ibn Haukel. It is probable that Kariá Pir, 1½ miles to the east of the modern city, represents the site of the Armabel which was destroyed by Mahommed Kasim in his victorious march to Sind in 710. There is another old site 5 miles to the west of the modern town. The ruins at Karia Pir, like those of Tijarra Pir and Khairokot, contain Arab pottery, seals, and other mediæval relics. The Lumris, or Lassis, who originate the name Las as a prefix to that of Bela, are the dominant tribe in the province. They are comparatively recent arrivals who displaced the earlier Tajik and Brahui occupants. It is probable that this influx of Rajput population was coincident with the displacement of the Arab dynasties in Sind by the Mahommedan Rajputs in the 11th century A.D. Some authorities connect the Lumris with the Sumras.

There are no published accounts of Bela, excepting those of the Indian Government reports and gazetteers. This article is compiled from unpublished notes by the author and by Mr Wainwright, of the Indian Survey Department. (T. H. H.*)

Bela, a town of British India, administrative headquarters of the Partabgarh district of Oudh; a railway station 80 miles from Benares. Population about 9000; municipal income (1897-98), Rs.9610. It adjoins the village of Partabgarh proper, and the civil station sometimes known as Andrewganj. It has a high school and three printing-presses, one of which issues a newspaper in English and the vernacular.

Belda. See NIGERIA.

Belfast, a maritime city, county and parliamentary borough, capital of the province of Ulster, Ireland, on the river Lagan, 101 miles N. of Dublin. It is the centre of an extensive railway system, which includes the Great Northern, the Belfast and Northern Counties, and the Belfast and County Down Railways. Population (1881), 208,122; (1891), 255,950, of whom 118,759 were males, and 137,191 females, divided as follows among the different religions—Presbyterians, 87,234; Protestant Episcopalians, 75,522; Roman Catholics, 67,378; Methodists, 13,747; and other denominations, 12,069. The following table shows the degree of education in 1891:—

	Males.	Females.	Total.	Percentage.			
				Roman Cath.	Presbyterians.	Protes. Epis.	Metho-dists.
Read and write	87,678	95,407	183,080	72·8	86·8	79·5	87·3
Read only . .	8,019	15,111	23,130	12·8	8·8	11·2	7·8
Illiterate . .	7,968	11,630	19,598	14·4	4·9	9·3	4·9

In 1881 the percentage of illiterates among Roman Catholics was 20·8, among Presbyterians 6·3, among Protestant Episcopalians 11·8, and among Methodists 5·2. In 1891 there were 30 superior schools with 2327 pupils (Protestants 1769 and Roman Catholics 558), and 233 primary schools, with 36,123 pupils (Protestants 27,070 and Roman Catholics 9053). Under the powers of an Extension Act the area of the city was considerably enlarged in 1897, and the population in 1901 was 348,876.

Recent History.—On the 27th April 1613 Belfast, then a small town, was constituted a corporation by charter of James I., to consist of a chief magistrate and twelve burgesses and commonalty, with the right of sending two members to Parliament. This charter was annulled by James II., and a new one issued in 1688, but the original one was restored in 1690 by William III. In conformity with the passing of the Municipal Corporations Act of 1840 the constitution of the corporation was changed and made to consist of ten aldermen and thirty councillors, under the style and title of “The Mayor, Aldermen, and Burgesses of the Borough of Belfast.” In 1888 the rank of a city was by Royal Charter conferred upon Belfast, with the incidental rank, liberties, privileges, and immunities. In 1892 Queen Victoria conferred upon the mayor of the city for the time being the title of “Lord Mayor,” and upon the corporation the name and description of “The Lord Mayor, Aldermen, and Citizens of the city of Belfast.” By the passing of the Belfast Corporation Act of 1896, the boundary of the city was extended, and the corporation made to consist of fifteen aldermen and forty-five councillors, and the number of wards was increased from five to fifteen. By virtue of the Local Government (Ireland) Act, 1898, Belfast became a county borough 1st April 1899. Letters patent issued 26th November 1866, granting a separate court of quarter sessions, comprising a court of record for the trial of civil actions; and by the Local Government (Ireland) Act,

1898, Belfast became for assize purposes “the county of the city of Belfast,” with a high sheriff.

Public Buildings and Improvements.—Few cities in the United Kingdom have been more extensively improved. Squalid districts have been removed and new thoroughfares opened up. The finest of these—Royal Avenue—contains the new post office and the Free Public Library (opened in 1888, and comprising a collection of over 30,000 volumes, as well as an art gallery and museum of antiquities). The Albert Bridge over the Lagan having collapsed, a new bridge was opened for traffic in 1890. The Campbell College, in the suburb of Belmont, was founded in 1892, in accordance with the will of Mr H. J. Campbell, who left £200,000 for the building and endowment of a public school. In 1897 the citizens subscribed £100,000 to found a new hospital to commemorate the Diamond Jubilee. A new city hall, now being erected at a cost of £200,000, will occupy the site of the old Linen Hall. In September 1899 the foundation stone of a Protestant cathedral to accommodate 3000 people was laid in Donegall Street, towards the erection of which the late countess of Shaftesbury bequeathed £7000. Several churches belonging to different denominations have also been built during the last few years, and the city now contains 121 places of worship. Six public parks and two theatres have been opened since 1878. The corporation has under its control the gas and electric undertakings, four public bath establishments, free library and art gallery, a well-equipped fire organization, a model lodging-house for men, and a modern refuse destructor. The tramway system, about 30 miles, is horse traction, but on the expiry of the company's lease the corporation will install electric traction. A technical institution, estimated to cost £100,000, is in process of erection. An infectious diseases hospital to accommodate 150 patients, also in progress, is to cost £45,000. The water-supply is under the control of the City and District Water Commissioners, who were incorporated in 1840. Under the Main Drainage Act of 1887 a comprehensive system was carried out, at a cost of £300,000, for intercepting the sewage which formerly flowed into the Lagan, and at present bacterial purification beds are being formed. Under recently-obtained powers water is brought a distance of 40 miles from the Mourne Mountains to a service reservoir at Knockbreckan. The estimated cost of this undertaking is over £1,000,000. There are two other sources of supply.

Administration.—Belfast is divided into four parliamentary divisions, north, south, east, and west, the number of registered electors in 1901 being respectively 10,108, 8813, 14,903, 8230. The harbour and docks are managed by a board of Harbour Commissioners, elected by the ratepayers and the shipowners. The rateable value of the city in 1901 was £1,196,051, and the total revenue in 1900 was £429,000.

Commerce and Shipping.—By the Belfast Harbour Acts the commissioners were empowered to borrow more than £2,500,000, in order to carry out several new works and improvements in the port. Under the powers of these Acts a new channel, called the Victoria Channel, several miles in length, was cut, leading in a direct line from the quays to the sea. This channel now affords 20 feet of water at low tide, and 28 feet at full tide, the width of the channel being 300 feet. The Alexandra Dock, which is 852 feet long and 31 feet deep, was opened in 1889, and the extensive improvements (including the York Dock, where vessels carrying 10,000 tons can discharge in from four to six days) have been effected from time to time, making the harbour one of the most commodious in the United Kingdom. Since 1891 the foreign trade of

the port has increased by 72 per cent., which seems to prove that Belfast is fast becoming, like Liverpool, a great distributing port. The following table shows the number of vessels cleared from and registered at the port in various years :—

Year.	Cleared.		Registered.	
	Vessels.	Tonnage.	Vessels.	Tonnage.
1880	7965	1,616,908	399	76,386
1890	8050	1,840,666	293	125,632
1896	8737	2,207,965	250	146,710
1897	8763	2,298,868	235	137,386
1898	9049	2,369,908	229	128,283
1899	8454	2,358,705	219	139,074
1900	8318	2,325,936	210	147,575

In 1880 the harbour receipts were £101,537, and in 1899 the receipts were £158,772 and the expenditure £128,505. In 1880 the customs dues collected amounted to £1,492,875, in 1890 to £2,128,446, and in 1899 to £2,832,563, an increase of over 90 per cent. in twenty years. The following were the amounts of the chief exports in 1900—linen, 38,142 tons; whisky, 30,782 tons; aerated waters, 10,552 tons; iron ore, 50,155 tons; linen yarn, 9087 tons; and 125,239 head of cattle. The Harbour Commissioners have obtained parliamentary powers to construct a graving dock capable of accommodating the largest class of warships. The growth and development of the shipbuilding industry during recent years has been immense, the firm of Harland and Wolff being amongst the first in the trade. In 1895, 18 vessels were launched in Belfast of 101,816 tonnage; in 1896, 25 vessels of 119,756 tonnage; in 1897, 21 vessels of 108,863 tonnage; in 1898, 16 vessels of 121,380 tonnage; in 1899, 17 vessels of 127,652 tonnage; and in 1900, 16 vessels of 136,226 tonnage. Amongst the most notable of the recent vessels built by Messrs Harland and Wolff are the *Oceanic* (1899) and *Celtic* (1901), for the White Star Line, the two largest vessels constructed up to those dates.

Trade and Manufactures.—Belfast is the centre of the Irish linen industry; it contains within its boundaries about 480,000 spindles for spinning flax and 15,000 power-looms. It is also the headquarters and business place for the entire flax-spinning and weaving industry of the country. The machinery gives constant employment directly to about 40,000 workers, and for subsequent processes to prepare the cloth for the market it employs about 10,000 more. The linen yarns exported average 20,750,000 lb per annum, the value of which exceeds £1,000,000. The imported yarns average 8,800,000 lb a year, and cost upwards of £300,000. Distilling is extensively carried on, the largest firm paying over £1,500,000 annually in duty. Several firms are engaged in the manufacture of mineral waters, for which the water of the Cromac Springs is peculiarly adapted, and the volume of trade may be estimated from the fact that in 1899, 11,084 tons of aerated waters were exported. The city also contains two of the largest establishments of their kind in the world—ropeworks employing 3000 hands, and a tobacco factory. Belfast boasts the largest tobacco factory in the world, that of Messrs Gallaher, Limited, and the largest rope manufactory in the world, that of the Belfast Ropework Company, Limited. (W. H. P.)

Belfast, capital of Waldo county, Maine, U.S.A., situated in the southern part of the state, at the head of West Penobscot Bay, nearly 30 miles south of Bangor. It has an excellent harbour, with some commerce and varied manufactures, and is on a branch of the Maine Central railway. It was settled in 1770, and chartered as a city in 1853. Population (1880), 5308; (1900), 4615.

Belfort.—The territory of Belfort is, by the Franco-German Treaty of 1871, all that is left to France of its former Department of Haut-Rhin, created in 1790 out of territories belonging to Alsace, then one of the provinces of France. A mere fragment of its former self, the territory has been decreed resumption of the title "Département du Haut-Rhin." It comprises 4 cantons and parts of 2 others out of the 30 cantons composing in 1870 the Department of Haut-Rhin, and contains 106 communes. It is bounded on the N.E. and E. by German Alsace, on the S.E. and S. by Switzerland, on the S.W. by the Department of Doubs, on the W. by that of Haute-Saône, on the N. by that of Vosges. Its greatest length from N. to S. is 28 miles, greatest breadth from W. to E., 13½ miles.

With an area of only 235 square miles, it is, next to that of the Seine, the smallest Department of France. The northern part is occupied by the southern offshoots of the Vosges, the southern part by the northern outposts of the Jura. Between these two highlands stretches the Depression of Belfort, 18½ miles broad, joining the basins of the Rhine and the Rhône, traversed by the Rhône canal and several railways. A part of the natural highway open from Frankfort to the Mediterranean, the Depression has from earliest times provided the route for the migration from N. to S., and is still of great commercial and strategical value. The northern part, occupied by the Vosges, rises to 4124 feet in Ballon d'Alsace, the northern termination and the culminating point of the Department; to 3773 feet in the Planche des Belles-Filles; to 3345 feet in Baerenkopf; and to numerous other lesser heights. South of the Trouée de Belfort, there rise near Delle limestone hills, in part wooded, on the frontiers of France, Alsace, and Switzerland, attaining 1680 feet in the Forêt de Florimont. The territory between Lachapelle-sous-Rougemont (in the N.E.), Belfort, and Delle, does not rise above 1800 feet. The line of lowest altitude follows the river St Nicolas and the Rhône canal. The chief rivers are the Savoureuse, 24 miles long, running straight S. from the Ballon d'Alsace, and emptying into the Allaine; the Allaine, from Switzerland, entering the territory a little to the south of Delle, and leaving it a little to the west of Morvillars; the St Nicolas, 24 miles long, from Baerenkopf, running southwards into the Rhône canal and then S.W. into the Allaine. The climate is divided between the "Vosges climate" to the north of the town of Belfort, marked by long and rigorous winters, sudden changes of temperature, and an annual rainfall of 80 centimetres to 1 metre (31 inches to 39 inches), intensified by an impervious subsoil, against an average of 177 centimetres (30 inches) for the whole of France; and the "Rhône climate," milder and more equable, with a rainfall of 60 to 80 centimetres (23 inches to 31 inches), quickly absorbed by the soil or evaporated by the sun. The higher levels of the mountains are clothed with forests of pine, oak, beech, and chestnut. At lower levels grow the elm, ash, poplar, linden, maple, and acacia. Of wild animals there are found the wolf, fox, wild cat, otter, and badger. The population, 74,244 in 1881, 79,758 in 1886, had increased to 91,763 in 1901. Births in 1899, 2188, of which 259 were illegitimate; deaths, 1550; marriages, 638. There were in 1896, 188 schools, with 14,000 pupils, less than 1 per cent. of the population being illiterate. The only town in the territory is Belfort, whose population, 22,181 in 1886, had increased to 32,112 in 1901. The area under cultivation in 1896 amounted to 140,790 acres, of which 46,930 acres were plough-land. The wheat crop of 1898 was valued at £54,510; rye, £17,090; oats, £16,100; potatoes, £131,760; mangold-wurzel, £15,890; natural pastures, £155,600. The live stock of 1899 included 3550 horses, 19,940 cattle, 3800 sheep, 9440 pigs, and 1750 goats. Though minerals are not abundant, mining has made some progress in the territory. Its real industry, however, is in calicoes and spinning, an industry which, owing to the large immigration of spinners from the territory annexed by Germany, has made rapid progress since the war.

Belfort, or BÉFORT, chief town of the Territory of Belfort, France, 275 miles E.S.E. of Paris, on the railways from Paris to Bâle and Lyons to Strasburg. Its fortifications have been greatly extended since the war of 1871. In front of the citadel is a colossal figure, *The Lion of Belfort*, by Bertholdi, 36 feet high and 72 feet long, erected to commemorate the brave defence of the town during the war, and opposite the Hôtel de Ville a bronze group in memory of Thiers and Denfert-Rochereau. A new railway station was erected in 1890, and a civil hospital in 1895. The town has important trade, especially in wine. Imports in 1899, £3,468,000; exports, £4,864,000. Population (1901), 32,112.

Belgaum, a town and district of British India, in the Carnatic or Canarese-speaking division of Bombay. The town is situated in 15° 51' N. lat. and 74° 34' E. long., nearly 2500 feet above sea-level; it is a station on the Southern Mahratta railway, 245 miles south of Poona. The population in 1881 was 32,697; in 1891 it was 40,737; and in 1901 it was 26,237. Belgaum contains a cantonment which is the headquarters of a military district, with a garrison of all arms. It is also a considerable centre of trade and of cotton weaving. There are two cotton mills, with a capital of Rs.3,20,000, working 52,000 spindles, and employing 2186 hands, of whom 909 are children.

The district of BELGAUM has an area of 4657 square miles. The population in 1891 was 1,013,261, being 217 persons per square mile. Classified according to religion, Hindus numbered 873,051; Mahommedans, 80,484; Jains, 52,048; Christians, 7617, of whom 1454 were Europeans; Parsees, 61. In 1901 the population was 994,209, showing a decrease of 2 per cent., compared with an increase of 17 per cent. in the preceding decade. The land revenue and

rates were Rs.22,51,550, the incidence of assessment being about 15 annas per acre; the number of police was 877. Out of a total cultivated area in 1897-98 of 1,714,200 acres, 51,069 were irrigated, including 5479 from government canals. The principal crops are millet, rice, wheat, other food-grains, pulse, oil-seeds, cotton, sugar-cane, spices, and tobacco. There are considerable manufactures of cotton-cloth. The town of Gokak is known for its dyes, its paper, and its wooden and earthenware toys. The West Deccan line of the Southern Mahratta railway runs through the district from north to south. In 1897-98 there were 311 schools, with 18,168 pupils, showing one village with a school to every 17 square miles, and 1.9 pupils to every 100 of the population. Two high schools at Belgaum town are maintained by Government and by the London Mission; total pupils about 830. There are nine printing-presses, most of which issue a vernacular newspaper. In 1897-98 the municipalities had a total income of Rs.1,09,980, the incidence of taxation being 13 annas per head. The death-rate in 1897 was 42 per 1000.

BELGIUM.

GEOGRAPHY AND STATISTICS.

BELGIUM (French *Belgique*, Flemish *België*, German *Belgien*), a kingdom of Europe, lying between 49° 31' and 51° 30' N. latitude and between 2° 36' and 6° 3' E. longitude. Its frontier touches the North Sea, Holland, Rhenish Prussia, the Grand Duchy of Luxembourg, and France. Gradually rising towards the S.E., Belgium lies very low in the provinces of Antwerp and Flanders; reaches over 300 feet in height a little to the S.E. of Brussels; 650 feet near the Sambre and the Meuse; 1640 feet on the plateaux of the province of Luxembourg; over 2000 feet on the E. frontier of the province of Liège. The land is traversed from S. to N. by the Scheldt and its affluent the Lys, and by the Meuse and its affluent the Sambre. To the S. of the Sambre and the Meuse the country is, in general, undulating. The valleys of the Meuse, the Ourthe, the Amblève, the Lesse, the Semois, &c., are highly picturesque; the natural grotto of Han on the Lesse being celebrated, and the grotto of Remouchamps and the prehistoric caverns of Furfooz being no less remarkable. The mean annual temperature is 49.1° F. in the central part, but sinks to 44.6° F. on the highest plateaux. The most frequent winds are S.W. and W., bringing with them the humidity of the Atlantic. The average annual precipitation in rain and in snow amounts at Brussels to 28.8 inches.

Area and Population.—The area comprises 2,945,589 hectares, or 29,456 kilometres, or 11,373 English square miles, and the total population at the end of 1899 numbered 6,744,000, an average of 593.11 per square mile. The nine provinces, their respective areas, populations, and densities at the end of 1899 were:—

Provinces.	Area in English square miles.	Population at end of 1899.	Population per sq. mile, 1899.
Antwerp	1093	825,000	754.8
Brabant	1268	1,281,000	1010.2
Flanders } West	1249	811,000	649.3
} East	1158	1,035,000	893.7
Hainault	1437	1,134,000	789.1
Liège	1117	843,000	754.7
Limbourg	931	242,000	259.9
Luxembourg	1706	221,000	129.5
Namur	1414	352,000	248.9
Total	11,373	6,744,000	593

From 1876 to 1880 the average annual increase of population

was 46,000; from 1880 to 1890, 55,000; from 1890 to 1899, over 75,000. At the census of 1898, out of a total population of 6,669,732, 3,326,190 were males and 3,343,542 females. The births and deaths per 1000 inhabitants have since 1876 undergone a gradual diminution, the births however continuing in marked excess over the deaths, as shown in the following table:—

Year.	Average Yearly Births per 1000 Inhabitants.	Average Yearly Deaths per 1000 Inhabitants.
1877-1886	31.21	21.31
1887-1896	29.25	20.92
1898	28.62	17.61

For every 100 births the percentage of illegitimacy has since 1871 varied from 7.2 to 8.76. The annual immigration since 1871 has varied from 15,000 to 27,000, and, since that date, has been continuously greater than the emigration, which in 1898 reached its maximum of 22,860. Among the population of foreign birth in 1890, 64,800 were born in France; 47,459 in Holland; 38,367 in Germany; 9266 in the Grand Duchy of Luxembourg; and 4102 in England. Linguistically, Belgium is distributed into three parts: Flemish, to the N. of a line stretching from near Warneton on the Lys eastwards to Visé on the Meuse; French in the country of the Walloons, to the S. of that line; German, in the arrondissement of Arlon. At the census of 1890 there were 2,744,271 inhabitants, or 45.21 per cent. of the total population, speaking only Flemish; 2,485,072, or 40.94 per cent., speaking only French; 700,997 speaking both French and Flemish; and 32,206 speaking only German.

Constitution and Government.—The constitution, adopted in 1831, was revised in 1893 with a view to extension of the rights of suffrage. The form of government is a constitutional, representative, and hereditary monarchy. The constitution declares that all power emanates from the people, and establishes three authorities—legislative, executive, and judicial. The legislative power is the conjoint function of the chamber of representatives, the senate, and the king. The members of the chamber of representatives are elected for four years, the half of them retiring every two years. Their number must not exceed the proportion of 1 to every 40,000 inhabitants. To be elected a representative one must be a Belgian by birth or by naturalization, must have attained the age of twenty-five years, and be domiciled in Belgium. No other condition is required. Every member receives a yearly indemnity of 4000 francs (£160) for discharging his functions as representative. Before 1893 the electoral law was based solely on the census. The members of the chamber of representatives were elected by citizens paying in taxes a fixed amount (namely 42 francs, 32 centimes). After the revision of 1893 the constitution granted the right of suffrage to every citizen who had attained the age of twenty-five years and been domiciled for not less than one year in the same commune. A supplementary vote is allowed to every citizen fulfilling certain conditions in respect of age, family, and personal or property tax. Two supplementary votes are accorded to every citizen whose profession, or the possession of a diploma or a certificate, attests an average level of higher instruction. No person, however, can dispose of more than three votes. In 1892, before the revision, the number of electors was 36,775. In 1900, after the revision, it had risen to 1,432,232. Further, the law of 29th December

1899 introduced into the election of members of the legislative chambers the principle of proportional representation, a principle which in the case of an election divides the writs among the parties according to the number of votes they represent. The members of the senate are elected for eight years, one half being renewed every four years. Senators must be at least forty years of age, and must fulfil prescribed conditions of fortune, excepting in the case of a certain number elected by the provincial councils. They are chosen by so many of the electors who vote for the chamber of representatives as have attained the age of thirty years, amounting in 1900 to 1,227,720; and by the provincial councils, two, three, or four for each province, according to population. Sons of the king, or, failing these, Belgian princes of the reigning branch of the royal family, are, by right of law, senators at the age of eighteen, but till the age of twenty-five have no voice in the deliberations. The king takes part in the legislative power by his right of initiative to present projects of law, and by the assent he gives to the projects of law voted by the chambers. He is charged with the sole executive power, which he exercises through the intermediation of the ministers whom he appoints and removes, and who are held responsible for the acts of the government. There are eight ministries:—justice, foreign affairs, interior and public instruction, finance and public works, war, railways posts and telegraphs, agriculture, industry and labour. The country is divided into 26 judicial arrondissements and into 222 cantons of justices of peace.

Provinces and communes.—For purposes of civil administration, the country is divided into the nine provinces already specified, and the provinces, again, are divided into communes, at present numbering 2610. Each province is self-governed. In each there is a commissioner of the government, bearing the title of governor, and appointed by the king; and a council chosen for four years by the electors of the province. Since the revision of the constitution the electors to the provincial council are the same body as elect the senators. In 1893 the number of provincial electors was 425,451; in 1900, 1,227,720. The council must assemble each year in the month of July. The provinces are divided into administrative arrondissements, in each of which a *commissaire d'arrondissement* is appointed to watch over the administration of communes having less than 5000 inhabitants. Each commune is self-governed. In each there is a burgomaster nominated by the king and, saving in exceptional cases, chosen by the members of the communal council; also a number of aldermen chosen by the members of the council from among themselves; further, a communal council elected for eight years by the electors of the commune. To be an elector to the communal council, it is necessary, since the law of the 11th April 1895, (1) to be a Belgian by birth or by naturalization; (2) to fulfil the same conditions as are required for the right to elect senators; (3) to have been actually domiciled in the commune for at least three years. If the elector fulfil certain other conditions he may dispose of as many as four votes. In 1893 the number of communal voters was 547,550; in 1900, 1,136,010. The principle of proportional representation applies also to communal elections.

Religion.—The recognized religions are the Roman Catholic, the Protestant, the Anglican, and the Hebrew. The population is almost wholly Catholic. The Protestants number only about 15,000 and the Jews 3000. In the budget of 1898, 5,263,000 francs figures under the head of expenditure for the support of the Catholic religion, and 118,000 francs for the other creeds.

Education.—Free education has been recognized. There are accordingly schools of various grades established by private persons, by corporations and associations, and by the public authorities, national, provincial, and communal. There are three grades of general public education—elementary, middle-class, and higher. Elementary education comprised in 1898 more than 2000 infant schools with 195,000 pupils; 6700 elementary schools subject to government inspection, numbering altogether 775,000 pupils; 2300 adult schools with an attendance of 12,000; 19 normal schools for male teachers and 34 for female teachers, comprising altogether 3700 students. The expenditure on elementary education amounted in 1897 to 35,761,000 francs, in 1875 to 24,800,000 francs. The number of young men unable to read and write when called on to draw lots for the conscription was in 1870, 29·2 per cent.; in 1899, 12·8 per cent. Middle-class instruction, lower grade, was imparted in 1898 by 78 government schools for boys and 10 communal schools, having altogether 16,000 pupils; by 84 government schools for girls and 6 communal schools, with an attendance altogether of 7000 pupils; and by 2 male normal schools numbering, in 1899, 60 students, and 2 female normal schools numbering 100 students. Middle-class instruction, higher grade, was given in 1899 by 20 royal athénæum and 15 communal colleges, counting altogether 7500 scholars. The expenditure of the State, the provinces, and the communes on middle-class instruction, inclusive of the two grades, increases year by year, and amounted in 1897 to 4,600,000 francs. The higher learning is communicated in the two State univer-

sities of Liège and Ghent, in the two free universities of Louvain and Brussels, and in the "new" university founded at Brussels. To these universities are annexed schools of civil engineering, of mines, and of arts and manufactures. The students attending the universities numbered in 1899, in all, more than 5000. There is also a very large number of schools for special instruction. (1) For purposes of military instruction, there are at Brussels a military school, with an attendance of 300, designed for the training of officers of all arms, and a school of war (*école de guerre*) attended by officers desiring to obtain the brevet of *adjuvant d'état major*; a riding school; regimental schools with an attendance of 3300; classes for illiterate soldiers. (2) To provide artistic education, there are the Royal Academy of Fine Arts at Antwerp, with 1800 students, and 84 other academies and schools of design, having altogether an attendance of 15,000; the Royal Conservatoire of Music at Brussels with 1600 students; another at Ghent with 1200 students; another at Liège with 1200 students; and 71 other schools of music having an attendance altogether of 12,000. (3) For industrial and commercial education there are special schools, with 1400 students, attached to the universities; the Hainault provincial school of mines (250 students); industrial or professional schools, communal or free, having an attendance altogether of 17,000; the Institut Supérieur of Commerce at Antwerp; schools to teach weaving, brewing, &c. (4) There are also schools of navigation at Antwerp and Ostend; a government agricultural institute at Gembloux; reform agricultural schools and prison schools; schools for the deaf and dumb; schools of domestic economy, &c. Public education is supported and encouraged by numerous scientific and literary institutions or associations, the principal of which are the Royal Academy of Sciences, Letters, and Fine Arts, at Brussels, founded in 1769; the Royal Flemish Academy, founded at Ghent in 1886; the Royal Academy of Medicine, established at Brussels in 1884; the observatory set up at Brussels in 1826 and now transferred to Uccle; the Royal Museum of Natural History and the government botanic gardens at Brussels; the zoological gardens at Antwerp, formed by a private society; and other bodies. The Government has instituted prizes, granted every three years, in French and Flemish dramatic literature; every five years in the history of Belgium, in social science, French and Flemish literature, mathematics, and natural and medical physics; and every ten years in philosophy and philology.

Crime and Pauperism.—In 1897 the number of criminals sentenced at the Assize courts was 105; and at the correctional tribunals 43,864. The average number of inmates of the various classes of prisons in 1897 was:—central prisons, 735; secondary prisons, 3833; reformatories, 222. The charitable institutions received in donations and legacies in 1898, 4,407,000 francs. In 1898 the total entries in the depots of mendicité for the reception of beggars and adult vagabonds were 8623, and the expenditure 1,224,213 francs.

Finance.—Every year the chambers settle the accounts and vote the budget. The total receipts and total expenditure of the State have to be entered in the budget and in the accounts. A special court called the *Cour des Comptes* is charged with the duty of examining and liquidating the accounts of the general administration and of presenting its observations thereon. The revenue and expenditure for the years specified were as follows:—

Year.	Revenue (Francs).	Expenditure (Francs).
1880 . . .	394,215,932	382,908,429
1885 . . .	333,085,424	351,251,439
1890 . . .	378,404,819	417,893,629
1895 . . .	395,780,445	410,383,402
1897 . . .	499,612,888	511,398,214

From 1880 to 1897 the revenue has increased 26 per cent., and the increase on the expenditure has been in that period 33 per cent. The taxation, amounting to 28 francs per head of population in 1880, had risen to 31 francs per head in 1897. The total amount of taxation shows an increase of 39 per cent. on the total sum of 1880. Among the items of expenditure for 1898, the most formidable one is that on account of the service of railways, posts, and telegraphs, figuring at 127,679,000 francs. The next in importance is on account of the interest on public debt, 123,303,850 francs. The public debt, consolidated and floating, was in 1880 1,422,814,049 francs; in 1890, 2,018,043,774 francs; in 1899, 2,693,787,176 francs. In the budget for 1900 the revenue was estimated at 452,246,618 francs, and expenditure 450,929,726 francs. In each province the council settles every year the account of the revenue and expenditure of the preceding financial year, and votes the budget for the current year. In 1897 the provincial receipts amounted altogether to the sum of 17,501,567 francs. The sum total of the provincial debts amounted to 32,679,614 francs. In each commune the council prepares every year the budget of revenue and expenditure. In 1892 the sum total of the

communal receipts amounted to 178,020,761 francs, and that of its expenditure to 179,316,792 francs.

Defence.—The constitution establishes a permanent army, a gendarmerie, and a civil guard (*garde civique*). The army is recruited by voluntary engagement and by annual calls on the country, regulated by a drawing for conscription among the citizens who have reached twenty years of age. The contingent is fixed each year by enactment. Ordinarily it is about 13,000 men out of an average inscription of 63,000 men. The effective strength in pay on a peace footing is about 50,000 men; the complete war strength, including officers, 165,000. The strength of the gendarmerie, officers included, is 2865 men. In time of war the gendarmerie accompanies the army. The expenditure of the ministry of war for 1898 was 65,670,000 francs, five millions of which were on account of the gendarmerie. The expenditure on the war service in 1875 was 46,066,000 francs. The civic guard (*garde civique*) is composed of Belgians and foreigners who have been resident at least one year in Belgium, subject, however, in respect of the latter, to any provisions in international conventions. It is organized per commune or group of communes. It can only be mobilized by enactment. It is divided into the active and the inactive guard. The strength of the active guard is about 44,000 men. The yearly expenditure of the ministry of the interior for the civic guard is 139,000 francs. There are five fortified places in Belgium: Antwerp, capable of serving the army as a base of operations and as a refuge; it consists of a fortified *enceinte* and fourteen detached forts surrounding it at a distance of 3 to 7 kilometres (1·86 to 4·35 miles). The others are Dendermonde on the Scheldt, and Diest on the Demer, these two and Antwerp forming a triangle of defence; Liège, surrounded at a distance of 6 to 7 kilometres (3·73 to 4·35 miles), by fourteen detached forts; and Namur, surrounded by nine detached forts, which, with those of Liège, defend the valley of the Meuse. There is an exercise-camp at Beverloo in Limbourg, and a shooting artillery school at Brasschaet in the province of Antwerp.

Production and Industry.—The principal mineral production is coal, at present extracted from 115 mines actually in work, against 175 in 1875. These mines employ 120,000 workers; their annual production is about 22 million tons, of the value of 243 million francs. Notwithstanding the reduction in the number of working mines, the output has increased by 5 million tons since 1880. Black and red marble, building and paving stone, limestone and slate are extracted from 1500 quarries employing more than 35,000 workers, and yielding material to the value yearly of about 50 million francs. Iron, zinc, lead, and manganese are extracted by about 1600 miners, and the annual yield is valued at 2 million francs; since 1875, however, the production of these minerals has much declined, and it has been necessary to import them to the value, in 1898, of 90 million francs. The most important branches of industry are: agriculture, metallurgy, glass-works, and textiles. Agriculture employs the greatest number of labourers—19 per cent. of the general population. Cereals occupy 2,000,700 acres; fodder and orchards, 1,575,860 acres; potatoes, 456,950 acres; beetroot (sugar), 133,380 acres; and cattle number 1,420,000 head. The annual value of the agricultural products is estimated at about 1½ milliards of francs. Nevertheless, great quantities of food products are annually imported, amounting in 1898 to 480 million francs. The industry in metals, employing 32,000 workers and yielding a yearly value of 340 million francs, is represented by the manufacture of pig-iron, the construction of machinery and railway material; by the manufacture of arms, Liège producing annually one million of assayed pieces; by glass and crystal works employing altogether about 23,000 workers, and yielding in 1898 a value of 66 million francs. The manufacturing industry is represented more particularly by the fabrication of woollen yarn and woollen tissues, cloths, flannels, covers, &c., employing 30,000 workers. Wools are imported to the amount of 110,250,000 lb from La Plata, Australia, and the Cape. The manufacture, again, of cotton thread and tissues employs 18,000 operatives; and cotton is imported yearly to the amount of 99,225,000 lb, principally from the United States of America, East Indies, and England. The manufacture of linen thread and linen cloth employs 36,000 workers, the flax being in part grown, the rest imported to the amount of 143,325,000 lb from Russia, Holland, and France. Lace is also manufactured. The sea fisheries occupy about 400 vessels, and crews to the number of 2000 men.

Commerce.—The annual value of the commerce with foreign countries amounted in 1899 to 7 milliards of francs in the way of general commerce, and to over 4 milliards in the way of special commerce. The value of the commerce has since 1870 experienced a continuous increase, as shown, in millions of francs, in the table given below.

The average share of each inhabitant in the special imports, *i.e.*, imports for home consumption, amounted in 1870 to 183 francs, rising to 310 francs in 1898; in the special exports (*i.e.*, exports

of Belgian produce), 136 francs in 1870 rising to 270 francs in 1889; in the transit trade, 165 francs in 1870, 187 francs in 1898. The countries with which Belgium did the greatest business in

	1870.	1880.	1890.	1898.
Imports, General Commerce	1760·2	2710·4	3189·2	3654·3
„ Special „	920·8	1680·9	1672·1	2260·2
Exports, General „	1521·8	2225·2	2948·1	3351·6
„ Special „	690·1	1216·7	1437·0	1949·3

1898 were: Germany, from which she received imports valued at 25·4 million francs, and to which she sent exports valued at 485·5 million francs; France, from which the imports were 385·7 million francs, and the exports to which 345·8; Great Britain exporting 312·0, and importing 360·7; Holland exporting 169·0 and importing 211·8; the United States exporting 280·1 and importing 69·4; Russia exporting 131·9 and importing 43·16. In the relative magnitude of the annual value of its special commerce, Belgium takes the sixth place among the nations of the world, following Great Britain, Germany, the United States, France, and Holland. The articles of greatest value imported were: cereals and their derivatives, 19 per cent. of the total import; raw textiles such as cotton, wool, silk, flax, hemp, and jute, 13 per cent.; mineral substances such as iron-ore, diamond, sulphur, copper, tin, lead, and timber. The exports of greatest value were textiles, wool, linen, oakum, hemp, 9 per cent.; cereals and their derivatives, 5 per cent.; coal, coke, briquette, glass, machinery and railway carriages, arms.

Shipping and Navigation.—Belgium has no navy for purposes of war. There is a daily service of steamers between Ostend and Dover, and between Antwerp and Harwich. The national merchant marine is not considerable, the number of vessels has little varied since 1870, amounting in 1898 to but 73, six of which were sailing vessels; the total tonnage being 108,537. The total number of vessels entering the ports of Belgium in 1899 was 8672, of 8,632,862 tons, and clearing 8581, of 8,521,331 tons. The ports are Antwerp, one of the most important in Europe, the ships entering which number annually more than 5200 (480 of them sailing vessels), with a united tonnage of 6,423,000; Ostend on the North Sea, with a yearly entrance of 1923 ships of 1,202,000 tons; Ghent, communicating with the sea by the Ghent canal to Terneuzen; Brussels, communicating with the Scheldt, by the canal of Willebroeck; Bruges, communicating by canal with Ostend; Nieuport on the North Sea; Zelzate on the Ghent-Terneuzen canal. Among the vessels arriving in 1898, the largest number came from Great Britain (4010); from Germany (986); Norway and Sweden (599). Antwerp has regular intercourse with all parts of the world.

Internal Communications.—Inland communication is highly developed, especially when compared with its extent of territory. The State and provincial roads, paved or macadamized, and the concrete roads have a total length of 5737 miles, against 5002 in 1875. The communal roads have likewise experienced a very large development. The total length of railway line open in Belgium in 1899 was 2867 miles (2069 belonging to the State, and 798 to companies), against 2175 in 1875. This gives an average of one mile of railway for every 4½ square miles of territory, and for every 2420 inhabitants. The gross receipts in 1898 amounted for the State to 183,950,458 francs, of which 60,185,764 francs were for passengers; and for the companies, 24,835,703 francs, of which 7,519,768 francs were for passengers. The number of passengers conveyed in 1898 was 126 millions. Since 1836 “vicinal” railways have been opened to the number of 96 lines, their total length of line in actual operation being, in 1898, 1094 miles. Horse and electric tramways have been laid down in the principal towns. The vicinal railways and tramways are constructed and worked by societies. Navigable waterways are formed of numerous canals, and canalized rivers such as the Upper Scheldt and its tributaries, the Lys, the Durme, the Dender, the Gnat and the Little Nèthe; the Meuse and its tributaries; the Sambre; and the Lower Ourthe. The total length of navigable waterways is 1360 miles.

Posts, Telegraphs, and Telephones are exclusively in the management of the State. The gross revenue of the post office in 1898 exceeded 22 million francs, and the expenditure was more than 12 millions. The total number of letters and post cards conveyed in 1898 was over 200 millions, of newspapers and printed matter, over 130 millions. In 1898 there were 1022 post offices in Belgium. The total receipts of the telegraph service in 1898 amounted to more than 7½ million francs, and to an ordinary expenditure of over 5,700,000 francs. The telegraph lines had in 1898 a combined length of 3964 miles; there were 1053 telegraph offices. The use of the telephone dates from 1884. All the lines constructed from the beginning, were taken up by the State in 1896. There were in 1898 local telephones of a total length of

19,620 miles. The same year there were over 100,000 international telephonic communications made.

Banks.—There are three very important financial institutions, established at the intervention of the state: the National Bank, the General Savings Bank under state guarantee, and the *Société du Crédit Communal*. The National Bank discounts bills, has its headquarters at Brussels, and branches in the provinces. It serves gratuitously as cashier of the state and of the Savings Bank. The following figures show the situation of the National Bank on the 31st December 1899:—

Active.	1000 Francs.	Passive.	1000 Francs.
Cash	112,668	Capital and revenue . . .	77,464
Portfolio, Belgium . . .	387,804	Notes in circulation . . .	548,357
Foreign	119,861	Treasury accounts, current	84,161
Advances in public purse	49,918	Private	38,332
Property, Mutuels . . .	89,477	Various	11,894

There are 54 joint-stock and private banks, also agricultural banks, credit unions, and popular banks. The sums discounted by the Bank in 1898 amounted to 3,026,959,163 francs. The Savings Bank under state guarantee receives deposits bearing interest, keeps cheque-books, and an insurance fund. There were in 1898, 899 offices, 1,377,643 depositors, and the amount of deposits at end of year was 532,081,819 francs.

The *Société du Crédit Communal* is designed to secure to the communes the means of contracting loans on favourable terms. A *Crédit Agricole* was officially organized in 1884 by a law authorizing the Savings Bank to devote part of its funds in loans to agriculturists. Among the great number of other financial institutions are savings banks under the patronage of communes, the society for the encouragement of national industry, &c.

Money.—The mintage of Belgian money is committed to a contractor, entitled *Directeur de la fabrication*, who works under the superintendence of the Government at a rate of charges fixed by royal decree. The value of all the coins minted since 1832 down to 1898 amounts to 1,172,516,848 francs. Since 1861 no coins have been minted, except the gold piece of 20 francs; silver pieces of 5, 2, and 1 francs, and of 50 centimes; nickel pieces of 10 and 5 centimes; and copper pieces of 2 and 1 centime.

For Belgium's relation with the CONGO FREE STATE, see that article, and also below (p. 203).

RECENT HISTORY.

When Belgium was definitely established, in 1839, as an independent state, the political parties which had formed a coalition for the purpose of safeguarding and reorganizing the country again split up. In 1846 the first Catholic administration was formed under Malou, and was succeeded in the following year by the first Liberal administration of Rogier and Frère-Orban. This government preserved Belgium from the contagion of the revolutionary ideas of 1848, extended the electoral franchise, diminished the intensity of the industrial crisis in Flanders, restored the financial equilibrium, instituted the municipal guard and the National Bank, and introduced public middle-class education. After a short interval of the Catholic Ministry of de Decker (1855-57), the Liberals again returned to power, under Rogier (1857-58), and under Frère-Orban (1868-70). In 1860 the octroi of the towns was abolished, and next year Protection was introduced, savings banks were established, co-operative and friendly societies promoted, and trade unions declared legal. In 1865 the devolution of the crown from Leopold I. upon his son was satisfactorily effected. Between 1870 and 1878 two Catholic Cabinets were in power, d'Anethan's (1870-71), and Malou's

(1871-78). The latter, composed of moderate Catholics, permitted the extreme Right, "the Ultramontanes," to take the lead. In this period came the struggle between the Pope and the Italian Government, and the German *Kulturkampf*. The Belgian Clericals declared in favour of the re-establishment of the temporal power, and congratulated the German priests whom Bismarck had dispossessed. M. Malou held the Government aloof from these manifestations, and in consequence of the representations of the German Chancellor was obliged even publicly to condemn them, but, notwithstanding the attitude of the Government, the Ultramontane agitation compassed its fall. The Liberals, who in Rogier's second Ministry had divided themselves into Doctrinaires (Moderates) and Progressists, again joined hands as a protest against Clerical intervention in politics and especially against the attitude of the Church in the elections. The Government was obliged to pass a law ensuring the secrecy of the ballot (1877), the provisions of which were framed on the English system, and this soon gave the Liberals a majority in the Chambers, which lasted from 1878 to 1884.

The new Cabinet devoted itself, under M. Frère-Orban, solely to the settlement of the educational question. The office of Minister of Public Education was created, and a new system of primary education introduced. In 1842 the popular schools were sectarian in character, and instruction by the clergy in the Catholic faith was obligatory; children belonging to other persuasions being dispensed from attendance. After 1846 the Liberal Congress, in framing the programme of the party, demanded the abolition of this system. The law of 1879 provided for the secularization of primary education; but by Article 4 the ministers of all confessions received permission to impart religious instruction in the schools to children whose parents desired it, at hours other than those set apart for regular education. Instruction in morals, until then entrusted to the clergy, was secularized and placed in the hands of the regular teachers. On the other side, the State extended its direction and control to the communal schools, subjecting them to a rigorous inspection. After the passing of this law, a struggle ensued between the Government and the Liberal party on the one side, and the Episcopate and the Catholic party on the other, the latter not being satisfied with the concessions made by Article 4. The bishops condemned the school law, and ordained that absolution should be refused to teachers in the Government schools, and to all parents who left their children in them; moreover, they implored their clergy to found schools everywhere in opposition to the schools "sans Dieu." This movement succeeded to a great extent. In 1884 the State primary schools numbered only 346,000 scholars, as against 500,000 in the Catholic schools. The Government was unable to prevail upon the Episcopate to end this "school campaign," the clergy being entirely independent of the State, although it vainly negotiated with the Pope for the issue of an ordinance to the bishops to abandon their opposition to the law. M. Frère-Orban was obliged to recall the Belgian Minister to the Vatican on the eve of the fêtes of the national jubilee, 1880, with which the clergy refused to associate themselves. The struggle was embittered by the report of a parliamentary committee appointed to inquire into the educational system, which not only showed conclusively the insufficiency of education as imparted in Catholic schools, but exposed the measures taken by the clergy to boycott the Government schools.

In order to meet the Catholics with any hope of success, Liberalism had need of all its strength; but at this very juncture it became so completely disintegrated that its

*The

party
and the
education
question.*

unity has never since been restored. The cause of this disintegration was the extension of the franchise.

The Constitution of 1831 (Article 47) granted the Parliamentary franchise to citizens paying 100 florins

Dutch currency (211 f. 60 c.) direct taxes in the large communes, gradually descending to 20 florins in the villages. The Liberal Congress of

1846 demanded the reduction of the electoral qualification to the last-named figure, and this reform was carried out in 1848. It was impossible to go farther without modifying the text of the Constitution, which required the consent of two-thirds of the Chambers, specially elected for the purpose. Nevertheless, the Liberal Progressists in November 1870 proposed in the Chamber the revision of Article 47. This motion was rejected by 73 Liberal and Catholic votes to 23 Progressist. But, in order to some extent to compensate the minority, the Ministry of M. d'Anethan lowered the qualification for the provincial and communal electorate, so far as it was possible to do so without violating the Constitution. There were from that date 350,000 communal electors (paying 10 f. in taxes), 200,000 provincial electors (paying 20 f.), and 100,000 general electors (paying 42 f. 32 c.). This reform enhanced the strength of the revisionist movement, for the communal and provincial electors evinced a natural desire to acquire full rights of suffrage. Relying on these tendencies, M. Janson, head of the Progressists, moved a second time, in 1883, the revision of Article 47. This motion was defeated by 116 Catholic and Ministerial votes to 11 (8 Progressist and 3 Catholic). But, as in 1870, the Progressists again obtained some compensation. The electoral body, communal and provincial, was enlarged by the grant of the franchise to qualified electors, *i.e.*, such as could show, either by certificates or by examination, that they had received a full primary education. One hundred and thirty thousand new voters were thus created. But the hostility of the Progressists to the Ministry was not assuaged by this concession, nor by the lodging of Bills making education obligatory upon all, and founding industrial schools for infants. Moreover, to political difficulties financial ones were added. Receipts into the Treasury had fallen off, as a consequence of the European economic crisis; expenses had increased owing to the extension of primary education; and the deficit had reached a total of 25,000,000 f. in 1883. The Government, in spite of the Catholics and Progressists, imposed a fresh tax upon tobacco, alcohol, &c. In the month of June 1884, the elections not only deprived the Liberal party of its majority, but also consigned it for an indefinite period to the cold shade of opposition. Its defeat was due to the Catholic agitation against the School Law, and to differences in regard to the franchise question. The Conservative electors, swaying from right to left, and alarmed by the demands of the Progressists and the anti-Clerical policy of the Government, gave their votes to the Catholics.

The period since 1884 may be divided into two parts, that of the *bourgeois* régime, or the limited franchise (1884-94), and the beginning of the Democratic

régime — universal suffrage (1894-1900). Six Ministries were in office, under Malou, Beernaert,

de Burlet, de Smet de Naeyer, van den Peereboom, and de Smet de Naeyer (for the second time). In the Malou Ministry, which lasted from June to October 1884, the Premier's chief colleagues were MM. Woeste, Beernaert, and van den Peereboom. The portfolio of Public Education was abolished, and a new enactment replaced the School Law of 1859. The communes obtained the right to suppress their secular schools, and to adopt at their pleasure the Catholic schools established since 1879. They might retain at least one secular

school, or adopt at least one Catholic school, where 25 fathers of families demanded it. The State subsidized all the communal schools, whether secular or sectarian. Secular instruction in morals disappeared from the programme, but religious instruction was not made obligatory. The passing of this Bill in October called forth violent protests. The Liberal mayors of the large cities went in a body to the king to entreat him to withhold his sanction; the measure none the less became law. In the same month the communal elections turned out unfavourably for the Catholics, and the king, grasping the situation, demanded the resignation of the Ministers who had been most vehemently attacked on account of their Clericalism, namely, MM. Woeste and Jacobs. M. Malou followed his colleagues, and M. Beernaert, who had been Minister of Public Works from 1873-78, and again from June 1884, became President of the Cabinet.

M. Beernaert's Ministry, which held office during the period from October 1884 to March 1894, controlled affairs during the most troublous period through which Belgium had passed since 1839. The political agitation of 1884, confined to the *bourgeoisie*, gave place in 1886 to an agitation which was at once both political and social, and of which the main-spring lay in the working class. On the 18th of March 1886 a Socialist rising suddenly burst out at Liège, on the occasion of the anniversary of the Paris Commune. The movement rapidly spread in the industrial centres of Liège, Charleroi, and Mons. Thousands of working men went on strike, demanding better wages and the suffrage. On the 28th March a body of strikers set fire to a glass manufactory at Jumet, near Charleroi. The coalfields were put into a state of siege, and the military came on several occasions into armed conflict with the strikers. The vigour with which this outbreak was suppressed soon re-established public order, but these sad occurrences drew public attention sharply to the condition of the working classes. It was felt that political and social reforms were imperative. The Government opened a comprehensive inquiry, which served as the basis of numerous social laws. Simultaneously, the Liberal Progressists began a campaign for the extension of the franchise, and in this were supported by the Socialist labour party, formed in 1885.

The movement of 1886 must be regarded as one of the epoch-making events in modern Belgian history. By giving a fresh impulse to the demands of the revisionists, by calling forth the framing of laws for the protection of workers, and bringing the Socialist party upon the scene, it caused Belgium to pass rapidly from a middle-class to a democratic régime. In 1887 the third motion for revision was rejected in the Chamber by 83 votes (Right) to 35 (Left). The moderate Liberals, acting on the advice of M. Frère-Orban, voted on this occasion for the motion. Harmony did not reign among the partisans of revision: the Socialists demanded universal suffrage, while the Progressists, faithful to Liberal tradition, insisted upon granting the franchise only to such Belgian subjects as could read and write. But the unanimity of the parties composing the Left as to the necessity for revision, rendered the measure inevitable. The revisionist propaganda became intense. M. Janson was returned to the Chamber by the solid vote of the Liberals of the capital, and forthwith moved revision for the fourth time. The Socialist party threatened the Government that, in the event of M. Janson's motion being defeated, it would proclaim a general strike. The motion was eventually taken into consideration (November 1890) by the unanimous vote of the House, M. Beernaert having persuaded the Catholic majority to support the principle of revision. Between this vote and

Further demands for revision.

Catholic administrations.

the end of the Constitutional crisis three years elapsed, marked by long Parliamentary discussions, by demonstrations on the part of the revisionists, and by strikes of a political tendency. The length of the debates was due to the divergent views of the parties. The Government and almost all the Catholics declared in favour of the adoption of the "occupation and residence" qualifications (as in England). The moderate Liberals proposed to refuse the franchise to the illiterate, and to such as were in receipt of charitable relief, public or private. The Progressists rallied round the Socialist watchword, "universal suffrage." On the other side, the problem had become considerably enlarged. M. Janson had only demanded the modification of Articles 47 (right of suffrage) and 53 and 56 (organization of the Senate). M. Beernaert thought that the revision should extend farther, in order that the new Constitution should have the same equilibrium as that of 1830, urging that it was necessary to have a counterpoise to democracy. He declared himself in favour of a complete reconstruction of the Senate, the qualification for election to it being fixed at 2116 f. a year, the election being partly direct and partly indirect, the establishment of the obligatory vote, and proportional representation. Finally, he demanded that it should be recognized as the prerogative of the Crown to take the opinion of the electors on the laws passed in Parliament or on Bills submitted for its deliberation. In order to carry these reforms, the revision of Articles 54, 57, 58, 26, and 48 was imperatively required. The Senate and the Chamber declared, in May 1892, that the time was come to modify the articles indicated by M. Janson and M. Beernaert. As prescribed by the Constitution, the Chambers were immediately dissolved, and two new Chambers elected. The Catholics had a majority in both, but not sufficiently large to enable them to dispense with the assistance of the Liberals, the Constitution requiring for every revision a majority of two-thirds. At the beginning of the final debate, which lasted from February until April 1893, M. Beernaert appealed to the "patriotic consensus" of the parties, a consensus which was not, however, conspicuous until the last moment, when, after the close of the general discussion, votes were taken successively upon the various Bills for extending the franchise. These were all thrown out (11th and 12th April).

In view of this rebuff to popular aspirations, the Council of the Labour party proclaimed a general strike.

The Labour party and electoral revision.

Fifty thousand workmen struck work; in Brussels, violent demonstrations took place in the streets, and collisions followed between the working-men and the constabulary. The like happened at Antwerp and Mons, where several strikers were killed by the *gardes civiques*. The agitation assumed a dangerous aspect, and the Government and the Liberal Progressist Opposition perceived that it was necessary to terminate it. Harmony was restored as the result of a compromise proposed by M. Nyssens, Catholic Deputy and professor at the University of Louvain, who had already mooted the idea in a pamphlet published in 1890, and on 18th April the Chamber adopted the new Article 47 by 119 votes to 14. The new article introduced an electoral system until then unknown—*le suffrage universel plural*. Every Belgian citizen became an elector on attaining the age of 25 years, and one or two supplementary votes were conferred upon him under certain conditions. Hereupon the General Council of working men, while keeping universal suffrage, pure and simple, still nailed to the mast, ordered a resumption of work. The revision of the other articles presented fewer difficulties. M. Beernaert withdrew his amendment giving the Crown the right to take the opinion of the constitu-

encies, an innovation that seemed in the main contrary to the essence of a Parliamentary system, as well as dangerous to the Crown itself. But he obtained the obligatory vote, the possibility of introducing proportional representation, thanks to a redrafting of Article 48, and lastly some modifications in the organization of the Senate. The electoral age was to be 30 years, with a qualification of 1000 f., and twenty-six senators were to be elected by the provincial councils. The new articles were promulgated on 7th September.

The electoral laws had yet to be framed. M. Beernaert introduced the Bill for proportional representation, but, before it was set down for debate, it roused such violent opposition on the part of the Catholic majority that he resigned. The labours of the Ministry of M. de Burlet, which lasted from March 1894 to February 1896, were mainly directed towards the passing of electoral laws for the additions to the Senate and the Chamber (1894), to the Provincial Councils (1894), and the Communal Councils (1895). The general tendency of this legislation was to restrain the application of Article 4 as much as possible. The following conditions resulted from these laws. The citizen, in order to possess a vote for the election of representatives to the Chamber, was to be of a *minimum* age of 25 years, and of 30 years for the election of senators and provincial and communal councillors. A *minimum* of three years' domicile was required for the communal electorate, and of one only for each of the others. For the four categories of elections a supplementary vote was given to (a) citizens who, having attained the age of 35 years and being married or widowers with children, paid at least 5 f. income-tax, and (b) to citizens of the age of 25 years possessing real estate to the value of 2000 f., or Belgian State securities yielding an income of at least 100 f. Two supplementary votes were bestowed upon citizens having certificates of middle-class education or upon such as were fulfilling functions and professions requiring the possession of such educational certificates. Moreover, for the communal elections a third supplementary vote was given to those who were in possession of real estate yielding an annual income of at least 100 f. It was thus possible to have at most four votes for the communal elections and three for the rest. The composition of the three electoral bodies for the year 1894-95 was as follows:—For the Chamber of Representatives there were 1,354,891 electors with 2,085,605 votes, and 21 electors for each 100 inhabitants, giving 1.54 vote per elector. For the Senate and Provincial Councils there were 1,148,433 electors with 1,856,838 votes. Every 100 inhabitants had 18 electors, equal to 1.62 vote per elector. For the Communal Councils there were 1,124,276 electors with 1,926,681 votes, and 17.6 electors per 100 inhabitants, equal to 1.71 vote per elector. The communal law of 1895 introduced a system of partial proportional representation. Where none of the lists of candidates obtains half the votes, the seats are distributed among the lists that have obtained a certain number of votes (*quorum*). On the other hand, the laws of 1894 retained, in the case of the other assemblies, both the system of majorities and the *scrutin de liste* by arrondissement or by canton.

These legislative labours having been completed, all the elected assemblies were dissolved and reconstructed by universal suffrage. The Parliamentary elections of October 1894 sent to the Senate 71 Catholics, 29 Liberals, and 2 Socialists (in February 1900 the numbers were respectively 72, 29, and 1), and to the Chamber 104 Catholics, 28 Socialists, and 20 Liberal Progressists (in February 1900 the figures were respectively 112, 28, and 12). The main features of this election were the great strengthening of the Catholic majority, the advent of a compact body

of Socialists, and the defeat of the Liberals. But the strength of the parties was not proportionate to the number of seats gained; the strength of the Catholic vote being 900,000 as against 350,000 Socialists and 450,000 Liberals. The provincial elections in the same year gave the Liberals the administration of two provinces—namely Brabant and Hainault; the Radical Socialists secured Liège, and the Catholics the remaining six provinces. The communal elections held in October 1895 resulted, in many of the cities, in councils without a stable majority, a state of things due to the existence of the three parties and to proportional representation. In February 1896 M. de Burlet, being in bad health, transferred the direction of public affairs to the Minister of Finance, M. de Smet de Naeyer. The Liberal defeat and the Socialist successes had substituted a revolutionary for a constitutional Opposition in Parliament. The new Cabinet recognized all the dangers of the situation from the point of view of monarchical and Conservative interests. On the other hand, the Liberals demanded a reform calculated to make their numbers in the Chamber proportionate to their electoral strength. The faults of the existing system were so apparent that opinion among all parties soon veered round in favour of its abolition. Yet parties and Ministry alike were divided as to the nature of the reform required. Some, like M. Woeste, were for the system of the *scrutin uninominal*, others demanded with M. Beernaert complete proportional representation. The more the Opposition on the left insisted on these demands, the less harmony reigned in the majority and in the Government. Hence, in 1899, a Ministerial crisis occurred. MM. de Smet de Naeyer and Nyssens, being unable to persuade their colleagues to declare in favour of proportional representation, resigned office.

The new chief of the Cabinet was M. van den Peereboom, who had been Minister of Railways since 1884.

He conceived that he could solve the difficulty by applying proportional representation to the large arrondissements, returning at least three senators and six representatives, the *scrutins* of the small arrondissements continuing to be held on the majority system. This proposal met with formidable opposition. It satisfied neither M. Woeste nor his friends, and was virulently attacked in Parliament, in the press, and on platforms, by Liberals and Socialists alike. As a matter of fact it tended to keep the Catholic party in power. It actually confirmed them in possession of the majority of the small arrondissements they already held, and brought them seats in the large arrondissements, where they had hitherto not held any, or where the possession of the seats they had previously held was precarious. In spite of all protests to the contrary, M. van den Peereboom insisted on pressing his Bill; the Socialist Deputies began a course of organized obstruction in the Chamber, and from Parliament the agitation passed to the street. On several evenings in succession during June bloody encounters took place between the demonstrators and the gendarmes guarding the Houses of Parliament, the palace of the king, and the houses of Ministers. As in 1893 the movement degenerated into riots. It extended to all the large cities of the province, and found support among the Liberal middle classes; even the *garde civique* declared its dissatisfaction. The Government, weakly supported by the Right, gave way, as in 1893, and withdrew the Bill. A month later, in August 1899, M. van den Peereboom, despairing of finding another solution of the problem, resigned, making way for the second ministry of M. de Smet de Naeyer. The new Cabinet at once introduced a Bill giving proportional representation (for Parliamentary

elections) to all the arrondissements. After a long debate, the Bill was adopted by the Chamber, in November, by 67 votes to 60, and by the Senate, in December, by 62 votes to 26, in spite of the double opposition of the Catholics, who held to M. Woeste, and of the Socialists, who considered the passing of the Bill of less importance than the suppression of plural voting. In both Chambers motions for the revision of Article 47 with a view to the introduction of the principle of "one man one vote" were defended, but rejected by an overwhelming majority. The features of the law are proportional distribution of seats among all the lists *en présence*, irrespective of the number of votes polled; grouping of the smaller districts in larger arrondissements; determination by the clerks of the lists of the order of election of candidates; prohibition of electors from giving votes to candidates of two lists; and the appointment of deputy Senators and representatives. The first elections which took place under the operation of the new law in May 1900 resulted as follows: there were elected to the Senate 58 Catholics, 39 Liberals and Radicals, and 5 socialists; to the Chamber of Representatives 85 Catholics, 1 Christian Democrat, 33 Liberals and Radicals, 33 Socialists. The Catholic majority in the two Chambers sensibly diminished, the Socialists and especially the Liberals gaining seats. Experience has shown that the Belgian electoral system is very complicated, and its simplification is urgently demanded. The Socialists and a majority of the Liberals advocate universal suffrage pure and simple, *i.e.*, the suppression of plural voting. They also demand the system of proportional representation, and an active agitation has begun in favour of these reforms. We may conjecture that, despite the opposition of the Catholics and certain Liberals, complete political equality will be finally attained if the union of the Liberal *bourgeoisie* and the Socialists, which brought about the electoral reforms of 1893 and 1899, becomes consolidated.

There are three political parties in Belgium—the Catholics, the Liberals, and the Socialists. The Catholic party was formed after the publication of the Encyclical in 1832. In 1846 it came into power for the first time, and up till 1901 had held it for twenty-seven years. It published its programme for the first time at the Congress of Malines in 1863. True to the instructions of the Papacy, it has, since then, posed more and more as the defender of constitutional liberties, by means of an ingenious distinction drawn between thesis and hypothesis. Its fight with the Liberal party centres essentially in two points—the question of education (lay or sectarian), and the maintenance of the privileged position of the clergy, which is paid by, but is yet independent of, the State. Since 1894, in spite of Conservative tendencies, the Catholic party, adapting itself to new political exigencies, has added to its old programme social reforms which have partly become law. Its unity, however, was in 1901 jeopardized by the rivalry of MM. Beernaert and Woeste, its two chiefs since the death of Malou,—the first before all a "Conservative," and the latter before all a "Clerical." Certain Catholic elements have become organized in working men's associations grouped in a democratic federation distinct from the Catholic federation. In Flanders a Democratic Christian party has been formed under the lead of the Abbé Daens, an inhibited priest. Its demands are obligatory education and military service, a progressive tax levied upon income, and measures of agrarian socialism. On the whole, the Catholic party finds its support in the aristocracy, in one section of the *bourgeoisie*, but chiefly in the Flemish peasants.

The Liberal party, as constituted by a congress in 1846,

had up to 1901 been in power for twenty-seven years. Towards 1860 there was formed within it a Progressist fraction demanding extension of the franchise and secular schools. How the party became divided in 1883 has been already shown. The Progressists have now formed themselves into a distinct party. The moderate Liberals favour personal military service, proportionate taxation of income, and liberty of labour in the case of adults. The demands of the Progressists are: a nation in arms, a progressive income tax, universal suffrage pure and simple, and all measures called "*Socialisme d'état*." Both fractions of Liberalism insist upon obligatory education and war upon Clericalism. Since 1894, a Liberal working men's party has been formed, to embrace all working men not belonging to the Socialist or Catholic groups. Its programme is that of the Progressists. But the Liberal party finds its recruits mainly among the middle class, and the financial and industrial world.

The Socialist party was formed on 6th April 1885, by certain co-operative groups. Its political action began after the troubles of 1886. It extended its influence to the workers in great industrial undertakings. We have seen what rôle it played in the revisionist crisis, and how it became an influential Parliamentary party. Its organization, a mixture of centralization and autonomy, is based upon the powerful trade unions of Ghent, Brussels, and other places, and upon numerous professional syndicates. Upon this substratum are built up (1) the district federations, uniting the socialist groups of each district; and (2) professional federations, uniting the workmen of the same branch of industry, wherever their domicile. Above these again comes the Congress, composed of delegates of each society, and at the pinnacle, the General Council, or the executive power, elected annually by the Congress. The political programme of the party may be summed up in a single word—"collectivism." The more immediate programme resembles that of the Progressists, who have often made electoral alliances with the Socialists, *i.e.*, universal suffrage, a nation in arms, regulation of labour, sliding-scale taxation, the monopoly of alcohol, and nationalization of mines and railways. The Socialist party naturally finds support among the industrial workers, and its considerable success is due to the numerical importance of this class in relation to the total population of the kingdom.

Of late years Parliamentary tradition has been greatly modified. Since 1884 power had remained in the hands of the same party, with frequent ministerial changes, due to divisions in the majority. The constitutional opposition of the Liberals has given place to the revolutionary opposition of the Socialists. There has been a material decline both in the quality of the debates and in the amount of useful work done in the Chamber. The Senate plays a part which is every day becoming more and more subordinate. It confines its labours to voting, without modification, Bills submitted to it by the Chamber. The supporters of proportional representation hope, perchance wrongly, that this institution is destined to rectify the defective working of the Parliamentary system.

There remain to be noted the principal enactments since 1885. In social legislation the following are the more important:—Prohibition of the "truck system"; the institution in 1887 of industrial and labour councils, composed of employers and employes, and of a superior council, formed of officials, workmen, and employers; laws assisting the erection of workmen's dwellings and supervising the labour of women and children (1889); laws for ameliorating the system of Friendly Societies (1890); laws regulating

workshops (1896); for the institution of miners' representatives (1897); conferring corporate rights upon trade unions (1898); guaranteeing the security and health of working men during the hours of labour (1899). In 1900 laws were passed regulating the contract of labour, placing the workman on a footing of complete equality with his employer, assuring the married woman free control of her savings, and organizing a system of old-age pensions. The fourth law of primary education (1895) made religious instruction obligatory, and extended State subsidies to all schools, communal, adopted, or free, that satisfied certain conditions. As a matter of fact, the Liberals, the Socialists, and the Christian Democrats placed in their programme "obligatory primary education." In 1899 there were in Belgium 6674 subsidized schools, having 775,000 scholars, out of a total of 950,000 children of school age. Only 68,000 did not receive religious instruction. A law affecting higher education, passed in 1890, enriched the University curriculum by giving it a more scientific character; and confirmed the privilege acquired in 1876 by the four Universities of Liège, Ghent, Brussels, and Louvain, of conferring upon their students diplomas giving access to the liberal professions.

The neutrality of Belgium, guaranteed by the Great Powers, is guarded by an army raised by conscription, substitutes being allowed. The annual contingent is 13,300 men; the term of service being two or three years with the colours and ten years in the reserve (130,000 men in time of war). For a considerable time past, the General Staff has demanded obligatory military service, 180,000 men in time of war, and the abolition of the principle of substitution. Of the political parties, the Catholics object to obligatory service and to increase of the army, while cordially advocating an army of volunteers and a reduction of the numbers with the colours. The Liberals uphold obligatory service with a reduction of the years with the colours. The Radicals and Socialists demand an army on the model of the Swiss. In 1887 the entrenched camps of Liège and Namur were formed. Until that date Belgium only possessed one entrenched camp, that of Antwerp (1859), which has since then been frequently enlarged. In 1897, the *garde civique*, a kind of *garde nationale*, was re-organized, and the Government endeavoured to give it the character of a reserve force to assist the army in defending the fortresses. The Government, in July 1901, laid before the Chamber a military Bill, which had for its object a reduction of the time of active military service, a large extension of voluntary service, and an increase of the annual contingent of 13,300 men in case only the volunteers do not join in sufficient numbers. This Bill did not abolish the principle of substitution, a reform demanded by the Liberals and the Socialists, nor did it seriously increase the effective strength of the army in time of war, a measure which was considered indispensable by the Military Commission of 1900-1901. (See ARMIES.)

The system of commercial liberty and treaties of commerce, established by M. Frère-Orban in 1861, is still of practical value in its main features. It is of vital importance to Belgium, a country of great industrial production and of dense population. To this system, in fact, Belgium owes her material prosperity. Nevertheless, protectionist tendencies, which took their rise among the agriculturists, have recently gained ground. Since 1887 duties have been imposed upon imported live animals and dead meat; and since 1895 duties upon barley, oats, &c., have either been imposed or the old ones increased.

Of six millions of inhabitants, according to the census of 1890, two and a half millions spoke French, or one of

its dialects—namely, Walloon; and two and three-quarter millions, Flemish. The linguistic frontier runs from west to east (from Comines, lying to the north of *Language*. Lille, to Visé, to the north of Liège). The sole official language of the country from the 15th century to within the last few years was French (with the exception of the Dutch period, 1814-30). But the Flemish have by degrees succeeded in obtaining for their language an equal footing with French for official business. The introduction of universal suffrage has enhanced the strength of the Flemish movement, because the Deputies of Northern Belgium are now elected by citizens, of whom four-fifths are ignorant of French; indeed, in 1900 there was one Deputy who did not even understand that language. Some of the principal laws on the subject are these—use of Flemish in the law courts (1873); in the documents of public administrations (1878); and in middle-class schools (1883); promulgation of laws in both languages (1898).

Belgium of the present day affords a picture of a rapid and general transformation. Politically, it is becoming a democracy; economically, thanks to the development of its industries within, and of its commerce and colonial enterprise without, it is one of the wealthiest and most energetic nations of Europe. Its economic progress has determined its political transformation. Situated at the meeting-point of three great civilizations, whose influences it at once feels and assimilates, Belgium is becoming more and more a microcosm of Europe, an active laboratory of political, economic, and social experiences.

The political relations subsisting between Belgium and the Congo State date from 1885, when Leopold II., president of the African International Association, received at the Berlin Congress the sovereignty of the African State. The Chambers at once and almost unanimously authorized the King to accept this mandate. In 1890 King Leopold communicated to Parliament a clause in his will by which, on his death, he devised his African possessions to Belgium. In 1895 the Government deposited a Bill in the Chamber making the Congo State a Belgian Colony. The introduction of this Bill had been preceded by the conclusion of two conventions; one between Belgium and the Independent State, and the other between Belgium and France by which the latter declared that she did not oppose the cession of the State to Belgium, reserving, however, to herself the right to pre-emption should, in the future, Belgium dispose of either the whole or part of her African colony. In view of the violent opposition of the Socialists and of certain Catholics, the Ministry withdrew the Bill. Various laws have associated Belgium in the task of governing the Congo. A law of 1887 authorized the Congo State to issue in Belgium a loan to the amount of 150,000,000 f. Subscriptions were in 1889-95 invited for shares in the railway from Matadi to Stanley Pool, which was opened in 1898. A loan of 25,000,000 f. to the Independent State (1891) was in 1895 increased by a second loan of 6,850,000 f. In return, Belgium obtained the right to elect, in 1900, whether these advances should be repaid or whether the Congo State should be annexed. The Belgian Government was not, however, obliged to come to a decision on the date fixed. In accordance with the Government of the Congo State, the Belgian Government, in July 1901, passed a convention through Parliament, by virtue of which the Congo State is dispensed from payment of its debt to Belgium until an indeterminate date. Belgium reserves its right to annex the Congo at a date equally indeterminate. The Government, moreover, promised to bring in a Bill regulating the relations between Belgium and the Congo, in the event of the annexation of the latter.

LITERATURE.

Belgian literature, as distinguished from French, has come about through a fusion of two elements, the Flemish and the Walloon, which make up what we call the Belgian race; and it is only somewhat recently that any attempt has been made in literature to fuse these two elements. The Walloon, which is related to the French, brings a nervous sensibility, a delicate mental energy, while the Flemish, which is related to the Dutch, brings a slow, profound faculty of meditation, an almost primitive simplicity, together with a gross animal fervour, deeply rooted in the earth. Belgium is the country of Ruysbroeck and of Rubens, of the most spiritually abstract of mystics, and of the most carnal of the painters of life. In Belgian literature, coming into existence under that twofold influence, one becomes conscious at once of the body and of the soul, each interpenetrating the other in a constantly realized communion with nature. Beginning unconsciously, and under definitely French influences, Baudelaire, Zola, for example, a group of Belgian writers began to detach themselves from the various schools of France; their first public proclamation of a new literature may be dated from the banquet given in 1883 to Camille Lemonnier. Lemonnier had already found out a way for himself, on definitely Flemish soil; Maeterlinck began to concern himself with the soul; Eekhoud with the strange passions of the body; Verhaeren with whatever was most coloured and violent in body and soul and the external world; Rodenbach with the aged quietude of the little dead cities of his country. It was as if a sluggish body had become possessed of an unexpectedly powerful life; as if restless nerves had come to awaken a stolid nature. It was thus a new quality of imagination which seemed to reveal itself, as the soul became conscious of the mystery of the universe, and the body shivered at new fears, apprehensions, the haunting of a forgotten spiritual sense. It was the soul coming into a literature of mind, and at once the literature of Belgium was distinguished from the literature of France.

Camille Lemonnier (born 24th March 1855), though he may have learned something of his method from Zola, is himself a personal force, and perhaps the first personal force to show itself in Belgium. Beginning as an art-critic, his first characteristic books are the *Contes Flamands et Wallons* and *Un Coin de Village* of 1879. Then came *Les Charniers*, 1881; *Un Mâle*, 1881; *Le Mort*, 1883; *Happe-Chair*, 1886; *La Faute de Madame Charvet*, 1895; *L'Île Vierge*, 1896; *Adam et Eve*, 1896; *La Petite Femme de la Mer*, 1897, &c. His best novels, such as *Un Mâle*, are full of a great, healthy, animal life; the life of the earth, rudely yet subtly apprehended, as if by an instinct very close to nature. He knows the peasant, in all his simplicity, brutality, uncouth vigour.

He gives us the peasant as a human being, the most elemental of human beings. His descriptions are so admirable because they are so human. His men and women are admirable because they are seen as a part of the same substance as the woods and fields they move in, not as social items. They live, love, act, as they do, because a mysterious force, of which they are for the most part unconscious, is in them; the same mysterious force which germinates in the furrows which they turn. And so he has surprising naïvetés, can be gross, accepts no compromises, and yet is full of restraint, of a kind of dignity, the strong man's mastery over his own strength. His style is large, coloured, vividly sober, always firm and decisive, always the faithful interpreter of his thought or sensation.

Maurice Maeterlinck was born 29th August 1862. His first book was a collection of verses, *Serres Chaudes*, 1889; this was followed by *La Princesse Maleine*, 1889; *Les Aveugles*, 1890; *Les Sept Princesses*, 1891; *Pelléas et Mélisande*, 1892; *Alladine et Palomides*, 1894; *Le Trésor des Humbles*, 1896; *Aglavaine et Sélysette*, 1896; *La Sagesse et la Destinée*, 1898; *La Vie des Abeilles*, 1901. Maeterlinck, though he began with plays, and has only latterly written essays, is rather a philosopher who has turned dramatist than a dramatist who has turned philosopher. A brooding poet, a mystic, a contemplative spectator of the comedy of death: that is how he presents himself to us in his work, and the introduction which he has prefixed to his translation of *L'Ornement des Noces Spirituelles* of Ruysbroeck l'Admirable shows how deeply he has studied the mystical writers of all ages, and how much akin to theirs is his own temper. In his plays he is always concerned with spiritual issues, with action as it might be seen in dreams, with a world reflected in a chamber of mirrors, with disembodied passions and the tragedies of childish and ghostly souls. He has invented a whole theatre of marionettes, who are more mysteriously simple than human beings; he has made the stage at once more subjective and more pictorial than it ever was before. In his essays he is content to speak with his own voice, and his own voice is more beautiful, and has more beautiful and profound things to say, than the feigned voices of his characters. Speaking without intermediary, he speaks with a more absolute abandonment of every convention of human reserve, except the reserve of an extreme fastidiousness in the choice of words simple enough and sincere enough to convey exactly his meaning, more spontaneously, it would seem, than any writer since Emerson. His essays might well be the favourite reading of those to whom beauty must come with a certain dogmatism, if it is to be accepted for what it is.

The poetry of Emile Verhaeren (born 21st May 1855), more than that of any other modern poet, is made directly out of the complaining voices of the nerves. In his early books, *Les Flamandes*, 1883; *Les Moines*, 1886, he began by solid, heavily-coloured *genre* pictures in the Flemish style. But it is not until *Les Soirs*, 1887, that we find what was to be his really individual style developing itself. In *Les Débâcles*, a year later, this art of writing in coloured and audible metaphor, and on increasingly abstract and psychological subjects, the sensations externalized, has become more master of itself, and at the same time more immediately the servant of a more and more feverishly nervous organization. In *Les Flambeaux Noirs*, 1890, there is a self-analysis, a kind of self-torture, which conveys to one the sense of all that is most solitary, picturesque, and poignant in the transformation of an intensely active and keen-sighted reason into a thing of conflicting visionary moods. Gradually, in *Les Apparus dans mes Chemins*, 1891; in *Les Campagnes Hallucinées*,

1893; in *Les Villages Illusoires*, 1895; in *Les Villes Tentaculaires*, 1895, the hallucinations become entirely external; it is now the country, the village, the town, that is to say, the whole organized world, which agonizes among cloudy phantoms, and no longer a mere individual, abnormal brain. With *Les Heures Claires*, 1899, we see him, in these poems of fiery reverie, sending his soul into the universe, and becoming a vehement voice for all that he finds most passionate in it. It is, in its way, a dramatizing of emotion, but, if one may say so, an abstract dramatizing. In his two plays, *Les Aubes*, 1898, and *Le Cloître*, 1900, he tries to give a more lyrical form to the new subjective kind of drama which Maeterlinck has made possible, giving us, in his brief and fiery scenes, little broken bits of the savage forces of the world, working out their passionate issues in a conflict of cities, or under the quiet roofs of the cloister. His latest collection of poems is *Petites Légendes*, 1900. What he has so far achieved is a melodrama of the spirit; there is poetry in it, as there is in everything written by the only contemporary writer of French verse who has a really vivid energy, but there is rhetoric as well as poetry.

Georges Eekhoud (born in 1854) is in some ways the most passionately Flemish of the Belgian group, partial and imperfect as he is. In his *Kermesses*, 1883; *Nouvelles Kermesses*, 1887; *Le Cycle Patibulaire*, 1892; *Mes Communions*, 1895; *Escal-Vigor*, 1899; *La Faneuse d'Amour*, 1900, he has evoked, in a prose more feverish than the verse of Verhaeren, the image of all that is most excessive, outcast, extravagant, in the life of his country. He writes the tragedies of those whom their own natures, or the misery of circumstance, have brought into conflict with society. He writes with a kind of fury of sympathy, a sort of perverse ecstasy, as if he delighted in the sorrows for which he has so revolutionary a pity. Every story is a little violent episode, full of cruelty and compassion. The life of the people comes into his pages with all its exuberance, colour, disorder, its pell-mell of noble and abominable sentiments, its gross joys and sordid disasters; life so vehemently realized that it seems, in these pages, to overflow all bounds. He is impatient with words, as with acts; his words seem to reel under some airy intoxication; he writes always at full speed. All his work is a kind of confession, in which he seems to unburden himself of a heart-load of hates and sympathies, dramatizing his own emotions into incidents of an only too vigorous externality.

In Georges Rodenbach (born 16th July 1855, died 25th December 1898) we find the sleepy spirit of Bruges, that other side of what is typically Flemish, and the titles of his books are themselves significant of the aspect under which he saw his corner of the world: *Le Règne du Silence*, 1891; *Bruges-la-Morte*, 1892; *Les Vies Encloses*, 1896; *Le Carillonneur*, 1897; *Le Miroir du Ciel Natal*, 1898. His best known book, *Bruges-la-Morte*, is an attempt to study the soul of a town, which he evokes with an almost feminine delicacy of perception. His prose and verse are pallid, elegant, monotonous with a kind of sweet monotony; they are sincere to a certain aspect of Belgian life, and to a personal way of receiving sensation, but they have none of the energy of a temperament able to dream strongly. They have charm, but it is a drowsy charm, a little conscious of the effectiveness of its languor; they are like faint pictures, not faded by time, but painted with timid colours.

By the side of these writers, or preceding them, as with Charles de Coster, Octave Pirmez, Théodore Hannon, are many writers whom space forbids to do more than mention; but an account of Belgian literature would not be complete without at least mention of the names of Edmond Picard, Eugène Demolder, Charles van Lerberghe,

Max Elskamp, Albert Giraud, Fernand Severin, and Albert Mockel.
(A. Sv.)

Belgrade (Servian, *Beograd*, i.e., *White Castle*), the capital of Servia, situated in 44° 47' N., and 20° 28' E. Belgrade in 1895 contained 59,790 inhabitants, of whom 11,471 were foreigners, mostly Austro-Hungarian and Turkish subjects. The number of houses in 1895 was 5317, of which 156 were governmental and 67 municipal buildings. It is the most important commercial town in Servia, and one of the more important of the whole Balkan peninsula. It is situated at the confluence of two great rivers, the Save and the Danube, on a triangular ridge of which the southern base, having in its centre the pyramid of the Avala hill, leans on the northern slopes of the mountains of Central Servia (called Shumadiya). The north-western side of the triangle slopes towards the Save, while the north-eastern side descends slowly to the right bank of the Danube. The northern end of the ridge is formed by a cliff of Tertiary chalk, about 200 feet high, on which the citadel (*grad*) is built. The western side of the cliff is washed by the Save, which, coming from the west, there falls into the Danube. This latter, coming from the north, turns at the foot of the citadel in an easterly direction. Just opposite the citadel, in a north-westerly direction, half-an-hour by steamer across the Danube, lies the Hungarian town Zimony (Serv. *Zemun*; Germ. *Semlin*), which in many respects may be considered as a suburb of Belgrade. The position of Belgrade has been always considered as of great strategical, political, and commercial importance. The city was considered to be the key of Hungary, and its possession was believed to secure possession of Servia, besides giving command of the traffic between the Upper and the Lower Danube. It has, in consequence, seen more battles under its walls than most fortresses in Europe. The Turks used to call it "*Darol-i-Djehad*," "the home of wars for faith." As the royal residence, the seat of the government, and the centre of the import trade, Belgrade is being rapidly transformed into a modern European town, with wide streets, electric tramways, and electric lighting. The glacis of the citadel has been converted into a beautiful park, from which there are lovely views. Another popular resort is the park of *Topchider*, with an old Turkish kiosk of Prince Milosh situated in beautifully-laid-out grounds. In the adjoining forest of lime-trees, called *Koshutnyak* (Parc-aux-Cerfs), Prince Michael was assassinated in 1868. The highest educational establishments are to be found in Belgrade: the "*Velika Shkola*" (a small university with three faculties), the military academy, the theological seminary, the high school for girls, a commercial academy, and several schools for secondary education on German models. A commercial tribunal, a court of appeal, and the Court of Cassation are also in Belgrade. There is a fine monument to Prince Michael, who succeeded in removing the Turkish garrison from the Belgrade citadel and obtaining other Turkish fortresses in Servia by skilful diplomacy. There are no monumental buildings in the town, still there are several fine architectural structures, the New Palace, the High School, the National Bank, and the National Theatre. There is also an interesting national museum, with Roman antiquities and numismatic collections, a national library with some 40,000 volumes, with a wealth of old Servian MSS., and a botanical garden, rich in specimens of the Balkan flora. To promote commerce there is a stock and produce exchange (*Berza*), a national bank, privileged to issue notes, and several banking establishments. The insurance work is done by foreign companies, amongst which the Gresham and the North British occupy foremost places.

For a town of nearly 60,000 inhabitants and of such political and commercial importance, which is also the seat of the Metropolitan of Servia, Belgrade has very few churches, and these are of a somewhat modest type. There are four Servian Orthodox churches, one Roman Catholic chapel, one evangelical chapel (German), one synagogue, and one mosque. This last is kept up entirely at the expense of the Servian Government.

The first fortification of the rock, at the confluence of the Save and the Danube, was made by the Celts in the 3rd century B.C. They gave it the name of *Singidunum*, by which Belgrade was known until the 7th century A.D. The Romans took it from the Celts, and replaced their fort by a regular Roman castrum, placing in it a strong garrison. Roman bricks, dug up in the fortress, bear the inscription, *Legio IV. Flavia Felix*. From the 4th to the beginning of the 6th century A.D. it often changed its masters (Huns, Sarmatians, Goths, Gepids); then the emperor Justinian brought it once more under Roman, or rather Byzantine, rule, and fortified and embellished it. Towards the end of the 8th century it was taken by the Franks of Charlemagne. In the 9th century it was captured by the Bulgarians, and held by them until the beginning of the 11th century, when the Byzantine emperor Basilus II. reconquered it for the Greek empire. The Hungarians, under king Stephen, took it from the Greeks in 1124. From that time it was constantly changing hands—Greeks, Bulgarians, Hungarians, replacing each other in turn. During the 14th century it was in the hands of the Servian kings. The Servian prince George Brankovich ceded it to the Hungarians in 1427. The Turkish forces unsuccessfully besieged the city in 1444 and 1456, on which last occasion a glorious victory was obtained by the Christian garrison, led by the famous John Hunyady and the enthusiastic monk John Capistran. In 1521 Sultan Suleyman took it from the Hungarians, and from that year it remained in Turkish possession until the year 1687, when the Austrians captured it, only to lose it again in 1690. In 1717 Prince Eugene of Savoy conquered it for Austria, which kept it until 1739, improving the fortifications and giving great impulse to the commercial development of the town. From 1739 to 1789 the Turks were again its masters, when, in that last year, the Austrians under General Laudon carried it by assault, only to lose it again in 1792. In 1807 the Servians, having risen for their independence, forced the Turkish garrison to capitulate, and became masters of Belgrade, which they kept until the end of September 1813, when they abandoned it to the Turks. Up to the year 1862 not only was the fortress of Belgrade garrisoned by Turkish troops, but the Danubian slope of the town was inhabited by Turks, living under a special Turkish administration, while the modern part of the town (the plateau of the ridge and the western slope) was inhabited by Servians living under their own authorities. This dual government was a constant cause of friction between the Servians and the Turks, and on the occasion of one conflict between the two parties the Turkish commander of the fortress bombarded the Servian part of the town (14th June 1862). The indirect consequence of this incident was that in 1866, on the categorical demand of Prince Michael of Servia, and under the diplomatic pressure of the Great Powers, the Sultan withdrew the Turkish garrison from the citadel and delivered it to the Servians. (C. MI.)

Belize. See HONDURAS, BRITISH.

Bell, Alexander Graham (1847—), inventor and physicist, son of Alexander Melville Bell (*q.v.*), was born in Edinburgh on 3rd March 1847. He was educated at the University of Edinburgh and the University of London, and removed with his father to Canada in 1870. In 1872 he removed to Boston, and became professor of vocal physiology in Boston University. In 1876 he exhibited an apparatus embodying the results of his studies in the transmission of sound by electricity, and his invention, with improvements and modifications, constitutes the modern commercial telephone (see *Ency. Brit.* vol. xxiii. p. 128). He is the inventor also of the photophone (see vol. xxiii. p. 130), an instrument for transmitting sound by variations in a beam of light.

Bell, Alexander Melville (1819—), teacher and phonetist, was born at Edinburgh on 1st March 1819. Between 1843 and 1865 he was a lecturer at the University and New College of his native city. He was subsequently a lecturer at University College, London, and professor of philology and linguistics in Queen's University, Kingston.

In 1881 he removed to Washington, D.C. He is best known as the inventor of "visible speech" (see *Ency. Brit.* vol. xxii. p. 385), a system of indicating by alphabetical characters the utterances and modes of action of the human organs of speech. Among his writings are *Visible Speech*, *Principles of Phonetics*, and several books on elocution.

Bellagio, a town in the province of Como, Lombardy, Italy. It is beautifully situated at the tip of the peninsula which separates the two southern arms of Lake Como, and on this account is a favourite tourist resort. Its picturesque surroundings are studded with handsome villas (e.g., Serbelloni, Melzi, &c.), and parks and gardens. The people are employed in turnery, and in the manufacture of silk, woollens, and cement. Population, about 3500.

Bellaire, a city of Belmont county, Ohio, U.S.A., situated in the eastern part of the state, on Ohio river, 5 miles south of Wheeling, at an altitude of 654 feet. It is entered by the Baltimore and Ohio, the Bellaire, Zanesville and Chicago, the Cleveland, Lorain, and Wheeling, and the Pennsylvania railways. Population (1900), 9912.

Bellamy, Edward (1850-1898), American author and social reformer, was born at Chicopee Falls, Massachusetts, 25th March 1850. He studied for a time at Union College and in Germany; was admitted to the bar in 1871; but soon afterwards entered upon journalistic work in Springfield, Massachusetts, and New York. After publishing three novelettes, pleasantly written, and showing some inventiveness in situation, but attracting no special notice, in 1888 he caught the public attention with *Looking Backward*, 2000-1887, in which he set forth ideas of co-operative or semi-socialistic life in village or city communities. The book was at first judged merely as a romance, but was soon accepted as a statement of the deliberate wishes and methods of its author, who devoted the remainder of his life, as editor, author, lecturer, and politician, to the spread of what he called "nationalism," his ideal being, in the opinion of M. Emile de Laveleye, "pure communism." Bellamy died at Chicopee Falls on the 22nd of May 1898. *Looking Backward* was widely circulated in America and Europe, and translated into several foreign languages.

Bellary (BALLARI), a city and district of British India, in the Madras Presidency. The city is 305 miles by rail from Madras. Population (1881), 53,460; (1891), 59,467; (1901), 57,700. The municipal income in 1897-98 was Rs.1,00,050. Bellary is an important cantonment, and the headquarters of a military division. There is considerable trade in cotton, with two large steam presses, and some manufacture of cotton cloth. There is also a cotton mill, with 110 looms and 17,800 spindles, employing 456 hands. There are a missionary college, three high schools for boys, with 725 pupils, nine printing-presses, which issue three vernacular periodicals, and several reading-rooms and literary institutions. In 1901 Bellary was chosen as one of the places of detention in India for Boer prisoners of war.

The district of BELLARY has an area of 5975 square miles. The population in 1891 was 900,126, being 151 persons per square mile. Classified according to religion, Hindus numbered 807,597; Mahomedans, 85,770; Christians, 5283, of whom 1124 were Europeans; Jains, 1463; "others," 13. In 1901 the population was 947,329, showing an increase of 8 per cent. The total amount of the land revenue and rates was Rs.19,64,992, the incidence of assessment being nearly 14 annas per acre; the number of police was 701. In 1897-98, out of a total cultivated area of 2,146,624 acres, 68,595 were irrigated, including

23,280 from Government canals. The principal crops are millet, other food-grains, pulse, oil-seeds, and cotton. There are considerable manufactures of cotton and woollen goods, and cotton is largely exported. The district is traversed by the Madras and Southern Mahratta railways, meeting on the eastern border at Guntakal junction, where another line branches off to Bezvada. In 1896-97 the number of schools was 1035, attended by 24,186 pupils, being one pupil to every 37 of the population. In spread of education Bellary ranks third among the rural districts of the province. The death-rate in 1897 was 31.2 per 1000.

Bellefontaine, a city of Ohio, U.S.A., capital of Logan county, north-west of the centre of the state, at the intersection of three railways. Population (1900), 6649.

Belleville, capital of St Clair county, Illinois, U.S.A., situated in the south-western part of the state, in 38° 29' N. lat., and 89° 58' W. long., at an altitude of 527 feet. It has four railways—the Illinois Central; the Louisville and Nashville; the Louisville, Evansville, and St Louis; and the St Louis, Belleville, and Southern; affording connexions in all directions. It is in the Southern Illinois coal-field, and has a large commerce in coal. It also has copper-refining works. Population (1880), 10,683; (1890), 15,361; (1900), 17,484.

Belleville, a city and port of entry of Ontario, Canada, and capital of Hastings county, 106 miles E.N.E. of Toronto, on Bay of Quinté and the Grand Trunk railway. Communication is maintained with Lake Ontario and St Lawrence ports by several lines of steamers. It is the commercial centre of a fine agricultural district, and has a large export trade in cheese and farm produce. There are several educational institutions, including Albert College, Ontario Business College, a convent, and an institute for the deaf and dumb, supported by the Government. The principal industries are cabinet and sewing-machine factories, grist and saw-mills, and distilleries. The exports for 1899-1900 were \$1,691,935, and the imports were \$460,326. Incorporated as a city in 1878, the population in 1881 was 9516, and in 1901 was 9117.

Belleville boilers. See BOILERS.

Bellevue, a city of Campbell county, Kentucky, U.S.A., on the south bank of the Ohio river, in the northern part of the state, near Cincinnati, Ohio, and adjoining Newport, Kentucky. Population (1900), 6332.

Belley, chief town of arrondissement in department of Ain, France, 47 miles S.E. of Bourg, on railway from St André-le-Gay to Virren-le-Grand, pleasantly situated between vine-covered hills about 3 miles from the right bank of the Rhone. Indian cottons and muslin are manufactured, and there is trade in cattle, fowls, and truffles. The best lithographic stone is found in the vicinity. The town is of Roman origin, and in the 5th century became an episcopal see, and the capital of the province of Bugey. In 1385 it was almost entirely destroyed by an act of incendiarism, but was subsequently rebuilt by Duke Amadeus VIII. of Savoy. A stone with a curious inscription commemorating its destruction was buried in the foundation of the bishop's palace. Population (1876), 3499; (1896), 3753, comm., 4687; (1901), 6467.

Bellinzona, now the sole political capital of the Swiss canton of Tessin or Ticino. It is on the St Gothard railway, 95½ miles from Lucerne, while a branch line of 13¾ miles leads from Bellinzona to Locarno. Bellinzona is a picturesque and thoroughly Italian little town. Population (1888), 3290; (1901), 5047.

Belluno, a town and episcopal see and capital of the province of Belluno, Venetia, Italy, on the river Piave, 72 miles by rail N. from Venice. It has a museum with numismatical, mineralogical, and other collections, and a technical school (1879). There are also mineral springs and a hydropathic (1483 ft.). Population (1881) 15,660, (1901) 18,649; of province (1891) 174,140, (1901) 191,400.

Beloit, a city of Rock county, Wisconsin, U.S.A., situated in 42° 30' N. lat., and 89° 11' W. long., in the southern part of the state, on Rock river, at an altitude of 744 feet. It has two railways, the Chicago and North-Western, and the Chicago, Milwaukee, and St Paul. Beloit College, a Presbyterian institution, was founded in 1846. It has a faculty of 20 professors and about 400 students. Beloit was settled in 1835, and received a city charter in 1856. Population (1880), 4790; (1890), 6315; (1900), 10,436.

Belper, a market town and railway station, in the Mid parliamentary division of Derbyshire, England, on the Derwent, 7 miles N. of Derby. The church of St Peter has been restored, and an Anglican convent, a mission church, and a public hall erected. The nail trade has declined, but there are now large cotton mills, hosiery works, foundries, and engineering works. Area of township (an urban district), 3183 acres; population (1881), 9875; (1901), 10,934.

Belvidere, a city of Illinois, U.S.A., capital of Boone county, on the Kishwaukee river and at the intersection of two lines of the Chicago and North-Western railway, in the northern part of the state. Population (1890), 3867; (1900), 6937.

Benares, or VARANASI, a famous city of British India, in the North-West Provinces, which gives its name to an administrative district and a division. The city is situated in 25° 18' N. lat., and 83° 3' E. long., 421 miles N.W. from Calcutta, on the left bank of the Ganges. The area (exclusive of cantonments) is 3448 acres. The population in 1881 was 214,758; in 1891 it was 219,467; and in 1901 it was 203,095. The municipality consists of 25 members, of whom 18 are elected, with the district magistrate as *ex officio* chairman. The municipal income in 1897-98 was Rs.4,93,238, of which just half was derived from octroi; the incidence of taxation was R.1:12:1 per head. A considerable debt has been incurred for water-works and drainage. In 1897-98 the total quantity of water pumped into the mains was 695,000,000 gallons; and the average daily consumption was 9 gallons per head. The death-rate in 1897 was 58.63 per 1000, comparing with a mean of 46.64 for the previous five years. In the early months of 1901 the city was visited by an outbreak of plague. The modern temples number 1454. The most conspicuous buildings are the mosque of Aurangzeb and the observatory of Raja Jai Singh. The European quarter of Benares lies to the west of the native town, on both sides of the river Barna. Here is the cantonment of Sikraul, no longer of much military importance; and the suburb of Sagra, the seat of the chief missionary institutions. Among recent buildings are the town hall, of red stone, erected at the sole cost of the Maharaja of Vizianagram, to commemorate the visit of Prince Alfred in 1870; the Carmichael Library, built mainly by the same nobleman in 1874; and the Prince of Wales Hospital, erected by public subscription to commemorate the visit of the prince in 1876. Benares conducts a flourishing trade by rail and river with the surrounding country. It is the junction between the Oudh and Rohilkhand and East Indian railways, the

Ganges being crossed by a steel girder bridge of seven spans each 350 feet long. The chief manufactures are silk brocades, gold and silver thread, gold filigree work, jewellery, embossed brass vessels, and lacquered toys. The Queen's College was attended in 1896-97 by 157 students. In addition, the Sanskrit College, founded by Warren Hastings, had 370 students. This institution is active in the publication of Sanskrit texts. There are also many efficient schools, some of which are supported by missionary and native bodies. The number of printing presses is about 50, publishing 5 newspapers. There are about 15 literary societies, of which the Carmichael Library receives a grant of Rs.300 from the municipality.

The district of BENARES, which extends over both sides of the Ganges, has an area of 1099 square miles. The population in 1891 was 921,943, being 912 persons per square mile. Classified according to religion, Hindus numbered 831,782; Mahomedans, 88,401; Christians, 1364, of whom 727 were Europeans; "others," 396. In 1901 the population was 882,972, showing a decrease of 4 per cent. The land revenue and rates were Rs.10,05,822, the incidence of assessment being R.1:6:1 per acre; the number of police was 2450. The district is under permanent settlement. In 1896-97, out of a total cultivated area of 396,466 acres, 136,647 were irrigated from wells, &c. There are no Government canals. The principal crops are barley, rice, wheat, other food-grains, pulse, sugar-cane, and opium. The main line of the East Indian railway runs through the southern portion of the district, with two stations and a branch to Benares city; the Oudh and Rohilkhand railway through the northern portion, starting from the city, with three stations.

The division of BENARES has an area of 10,414 square miles. The total population in 1891 was 5,368,774, being an average of 515 persons per square mile. In 1901 the population was 5,032,699, showing a decrease of 6 per cent. The aggregate land revenue, which is permanently assessed, amounts to Rs.44,38,308, the average incidence being Rs.0:14:4 per head of population, and Rs.0:14:10 per acre of total area.

Bencoolen (Dutch *Benkoelen*), a Dutch residency on the south-west coast of Sumatra extending from 2° 30' S. lat. to 5° 8' S., and separated by the Barisan mountains from Palembang and Lampong. Its area is 9426 square miles. The bays of the coast are but slight indentations and the rivers small. The chief products are rice, pepper, tobacco, cotton, and *gambier*. There is considerable fishing. Since the abolition of forced labour (1878) and the substitution of taxation, the residency has made progress. Bencoolen, the capital, is on the coast near the island of Pulu Tiku (or Rat Island). The population of the town is about 5000, of the residency 158,767, including 146 Europeans, 659 Chinese, and 43 Arabs and other Asiatic foreigners.

Bendigo, the official name of SANDHURST, a city of Victoria, Australia, in the county of Bendigo, on the main line of railway between Melbourne and Echuca, 101 miles by rail N.N.W. from Melbourne. It is the centre of a large gold-mining district, which is also noted for its wines and agricultural produce. The deepest shaft in the colony is the Lazarus, which is 3424 feet in depth, and is still being sunk. There are several handsome public buildings, including the government offices, law courts, and town hall, and various industries, the manufacture of Epsom pottery being specially noteworthy. The output of gold in the district, in 1899, was 235,596 ozs. Bendigo was proclaimed a municipality in 1855, a borough in

1863, and a city in 1871. Its water supply is excellent, and the street mains have a total length of 100 miles. Altitude, 758 feet. Mean temperature for the year, 58.7° F.; for January, 72.3°; for July, 46.1°; rainfall (16 years), 23.85 inches. Population (1881), 28,153; (1891), 26,774; (1901), 31,020.

Benedek, Ludwig (1804-1881), Austrian general, was born at Ödenburg in Hungary on 14th July 1804, his father being a medical man. He received his commission in the army as ensign in 1822. In 1846 he was engaged in suppressing the rising of Polish peasants in Galicia; he fought with great distinction during the Italian campaigns of 1848-49; was advanced to the rank of major-general, and took a leading part in the campaign of 1849 in Hungary, during which he was wounded. In the war of 1859 he commanded the eighth army corps, and in the battle of Solferino, where he held the right of the Austrian position, he succeeded in repulsing the attack of the Piedmontese. This success had little effect on the general course of the battle, but it confirmed his reputation as a fighting general and won him great popularity, which, owing to the prevailing discontent with the reactionary and clerical government of previous years, was increased by the fact that he was a Protestant and not of noble birth. He was made *Feldzeugmeister* and commander-in-chief of the Austrian army in Venetia. When war with Prussia was imminent he was with general approbation appointed to command the northern army which was to be concentrated in Bohemia. It was a post he did not himself desire, as he had no intimate knowledge of the country, and did not feel confidence in his capacity to direct operations on so large a scale. Though an admirable leader in battle, he had no scientific military education. It was, however, impossible for him to refuse the personal commands of the emperor and the requests of the Archduke Albrecht. The Austrian concentration was, however, not completed when war broke out, and during the first few days, instead of using the advantage which otherwise they might have secured by the possession of the inner lines, the Austrian armies were defeated in detail in a number of engagements fought between 24th June and 1st July; at Mönchengrätz, Gitschin, Nachod, Trautenau, and Kalitz. Benedek, therefore, telegraphed to the emperor advising him to make peace; the emperor refused on the ground that no decisive battle had been fought; Benedek, thereupon, instead of retreating across the Elbe, determined to bring on a decisive engagement, and took up a position with the whole of his forces (210,000 men) near Königgrätz with the Elbe in his rear. Here he was completely defeated by the Prussians on 3rd July, but he succeeded in effecting his retreat on the evening of the battle across the river. He was at once suspended from his command and a court-martial ordered; the emperor, however, in December determined that the inquiry should be suspended. Benedek from this time lived in absolute retirement, and in obedience to the emperor's orders made no attempt to defend himself. While the indecision which he showed during the first few days of the war to a great extent caused him to lose the confidence of the army and prepared the way for the catastrophe of 3rd July, he was undoubtedly much impeded by the defects of the Austrian organization, as well as by the reluctance with which the representatives of the greatest Austrian families saw themselves placed under the command of a man who belonged to the middle class. The official account of the campaign, *Oesterreich's Kämpfe 1867* (French translation *Les luttes d'Autriche*), probably for this reason leaves much to be explained as to the conduct of the war. The fullest account of Benedek's life and of the campaign of 1866

will be found in FRIEDJUNG, *Der Kampf um die Vorherrschaft in Deutschland*, Stuttgart, 1897. (J. W. HE.)

Benedetti, Vincent, COUNT (1817-1900), French diplomatist, was born at Bastia, in the island of Corsica, on 29th April 1817. In the year 1840 he entered the service of the French Foreign Office, and was appointed to a post under the marquis de la Valette, who was consul-general at Cairo. He spent eight years in Egypt, being appointed consul in 1845; in 1848 he was made consul at Palermo, and in 1851 he accompanied the marquis, who had been appointed ambassador at Constantinople, as first secretary. For fifteen months during the progress of the Crimean war he acted as chargé d'affaires. In the second volume of his essays he gives some recollections of his experiences in the East, including an account of Mehemet Ali, and a (not very friendly) sketch of Lord Stratford de Redcliffe. In 1855, after refusing the post of minister at Teheran, he was employed in the Foreign Office at Paris, and acted as secretary to the Congress at Paris (1855-56). During the next few years he was chiefly occupied with Italian affairs, in which he was much interested, and Cavour said of him he was an Italian at heart. He was chosen in 1861 to be the first envoy of France to the king of Italy, but he resigned his post next year on the retirement of Thouvenel, who had been his patron, when the anti-Italian party began to gain the ascendancy at Paris. In 1864 he was appointed ambassador at the court of Prussia.

Benedetti remained in Berlin till the outbreak of war in 1870, and during these years he played an important part in the diplomatic history of Europe. His position was a difficult one, for Napoleon did not keep him fully informed as to the course of French policy. In 1866, during the critical weeks which followed the attempt of Napoleon to intervene between Prussia and Austria, he accompanied the Prussian headquarters in the advance on Vienna, and during a visit to Vienna he helped to arrange the preliminaries of the armistice signed at Nikolsburg. It was after this that he was instructed to present to Bismarck French demands for "compensation," and in August, after his return to Berlin, as a result of his discussions with Bismarck a draft treaty was drawn up, in which Prussia promised France her support in the annexation of Belgium. This treaty was never concluded, but the draft, which was in Benedetti's handwriting, was kept by Bismarck and published in 1870. During 1867 he was much occupied with the affair of Luxemburg. In July 1870, when the candidature of the prince of Hohenzollern for the throne of Spain became known, Benedetti was instructed by the duc de Gramont to present to the king of Prussia, who was then at Ems, the French demands, that the king should order the prince to withdraw, and afterwards that the king should promise that the candidature would never be renewed. This last demand Benedetti submitted to the king in an informal meeting on the promenade at Ems, and the misleading reports of the conversation which were circulated were the immediate cause of the war which followed, for the Germans were led to believe that Benedetti had insulted the king, and the French that the king had insulted the ambassador. Benedetti was severely attacked in his own country for his conduct as ambassador, and the duc de Gramont attempted to throw upon him the blame for the failures of French diplomacy. He answered the charges brought against him in a book, *Ma Mission en Prusse*, Paris, 1871, which still remains one of the most valuable authorities for the study of Bismarck's diplomacy. In this Benedetti successfully defends himself, and shows that he had kept his Government well informed; he had even

warned them a year before as to the proposed Hohenzollern candidature. Even if he had been outwitted by Bismarck in the matter of the treaty of 1866, the policy of the treaty was not his, but was that of Drouyn de Lhuys. The idea of the annexation of part of Belgium to France had been suggested to him first by Bismarck; and the use to which Bismarck put the draft was not one which he could be expected to anticipate, for he had carried on the negotiations in good faith. After the fall of the empire he retired to Corsica. He lived to see his defence confirmed by later publications, which threw more light on the secret history of the times. He published in 1895 a volume of *Essais Diplomatiques*, containing a full account of his mission to Ems, written in 1873; and in 1897 a second series dealing with the Eastern Question. He died 28th March 1900, while on a visit to Paris. He received the title of Count from Napoleon.

Benedict, Sir Julius (1804-1885), musical composer, was born in Stuttgart on 27th November 1804. He was the son of a Jewish banker, and learnt composition from Hummel at Weimar and Weber at Dresden; with the latter he enjoyed for three years an intimacy like that of a son. He was appointed Capellmeister of the Kärnthnerthor Theatre at Vienna in 1823, and of the San Carlo Theatre at Naples in 1825. Here his first opera, *Giacinta ed Ernesto*, was brought out in 1829, and another, written for his native city, *I Portoghesi in Goa*, was given there in 1830; neither of these was a great success, and in 1835 he went to Paris, leaving it, at the suggestion of Malibran, in the same year, for London, where he spent the remainder of his life. In 1836 he was given the conductorship of an operatic enterprise at the Lyceum Theatre, and brought out a short opera, *Un anno ed un giorno*, previously given in Naples. In 1838 he became conductor of the English Opera at Drury Lane, under the famous Bunn management, during the period of Balfe's great popularity; his own operas, produced there, were *The Gipsy's Warning* (1838), *The Bride of Venice* (1843), and *The Crusaders* (1846). In 1848 he conducted Mendelssohn's *Elijah* at Exeter Hall, for the first appearance of Jenny Lind in oratorio, and in 1850 he went to America as the accompanist on that singer's tour. On his return in 1852 he became conductor under Mapleson's management, and wrote recitatives for Weber's *Oberon*, producing his best known opera, *The Lily of Killarney*, at Covent Garden, under the Pyne and Harrison Company, in 1862. At the same theatre his last work, originally intended for the stage, *The Bride of Song*, was brought out in 1864. From the beginning of the Monday Popular Concerts he acted as regular accompanist, and he conducted the Norwich Festivals from 1845 to 1878 inclusive. His cantatas *Undine* (1860) and *Richard Cœur de Lion* (1863), and his oratorio *St Cecilia* (1866) were brought out at these festivals, and his *St Peter* at the Birmingham Festival of 1870. The cantata *Graziella* was brought out at the Birmingham Festival of 1882, and in the following year was produced at the Crystal Palace as an opera. A symphony from Benedict's pen was given at the Crystal Palace in 1873, and he contributed an interesting life of Weber to the series of biographies of "Great Musicians." For many years he officiated as "conductor" at the most fashionable concerts in London, whether public or private, and was knighted in 1871. He died in London on the 5th of June 1885. Benedict was one of the last, but at the same time one of the most capable, of those numerous

German musicians who from the time of Handel onwards have found fortune by yielding to the less highly developed tastes of the English public, without making any very serious attempt to elevate the standard of their appreciation. (J. A. F. M.)

Benefice.—Under the modern statute law the term benefice means an ecclesiastical preferment with cure of souls, the right to confer which is called an advowson. An advowson is either presentative, in which case the patron presents a clerk to the bishop with a petition that he may be instituted to the vacant benefice, and if the clerk be canonically qualified the bishop admits and institutes him; or collative, where the bishop is the patron in right of his see. Durative benefices no longer exist, the Benefices Act 1898 making all donations with cure of souls presentative in accordance with the recommendation of a committee of the House of Commons in 1884.

The spiritual side of the right of advowson was also emphasized by the same Act. Under the previously existing law simony or "the corrupt presentation of any person to an ecclesiastical benefice for gift, money, or reward" renders the presentation void, and subjects the persons privy or party to it to penalties; a presentation to a vacant benefice cannot be sold, and no clerk in holy orders can purchase for himself a next presentation. An advowson may, however, be sold during a vacancy, though that will not give the right to present to that vacancy; and a clerk may buy an advowson even though it be only an estate for life, and present himself on the next vacancy. Under the Benefices Act, advowsons may not be sold by public auction except in conjunction with landed property adjacent to the benefice; transfers of patronage must be registered in the registry of the diocese, and no such transfers can be made within twelve months after the last admission or institution to the benefice. Restrictions had also been imposed on the transfer of patronage of churches built under the Church Building Acts and New Parishes Acts, and on that of benefices in the gift of the Lord Chancellor, and sold by him in order to augment others; but agreements may be made as to the patronage of such churches in favour of persons who have contributed to their building or enlargement without being void for simony.

The right of presentation may be exercised by its owner whether he be an infant, executors, trustees, coparceners (who, if they cannot agree, present in turn in order of age), or mortgagee (who must present the nominee of the mortgagor), or a bankrupt (who, although the advowson belongs to his creditors, yet has the right to present to a vacancy). Certain owners of advowsons are temporarily or permanently disabled from exercising the right which devolves upon other persons; and the Crown as patron paramount of all benefices can fill all churches not regularly filled by other patrons. It thus presents to all vacancies caused by simoniacal presentations, or by the incumbent having been presented to a bishopric or in benefices belonging to a bishopric when the see is vacant by the bishop's death, translation, or deprivation. Where a presentation belongs to a lunatic, the Lord Chancellor presents for him. Where it belongs to a Roman Catholic the right is exercised in his behalf by the University of Oxford if the benefice be situate south of the river Trent, and by that of Cambridge if it be north of that river.

Besides the qualifications required of a presentee by canon law, such as being of the canonical age, and in priest's orders before admission, sufficient learning and proper orthodoxy or morals, the Benefices Act now requires that a year shall have elapsed since a transfer of the right of patronage, unless it can be shown that such transfer was not made in view of a probable vacancy; that the

presentee has been a deacon for three years; and that he is not unfit for the discharge of his duties by reason of physical or mental infirmity or incapacity, grave pecuniary embarrassment, grave misconduct or neglect of duty in an ecclesiastical office, evil life, or conduct causing grave scandal concerning his moral character since his ordination, or being party to an illegal agreement with regard to the presentation; that notice of the presentation has been given to the parish of the benefice. Except by leave of the bishop or sequestrator, the incumbent of a sequestered benefice cannot be presented. The Act also gives to both patron and presentee an alternative mode of appeal against a bishop's refusal to institute or admit, except on a ground of doctrine or ritual, to a court composed of an archbishop of the province and a judge of the High Court nominated for that purpose by the Lord Chancellor, a course which, however, bars resort being had to the ordinary suits of *duplex querela* or action of *quare impedit*. In case of refusal of one presentee, a lay patron may present another, and a clerical patron may do so after an unsuccessful appeal against the refusal.

Upon institution the church is full against everybody except the Crown, and after six months' peaceable possession the clerk is secured in possession of the benefice, even though he may have been presented by a person who is not the proper patron. The true patron can, however, exercise his right to present at the next vacancy, and can reserve the advowson from an usurper at any time within three successive incumbencies so created adversely to his right, or within sixty years. Collation which otherwise corresponds to institution does not make the church full, and the true patron can dispossess the clerk at any time, unless he is a patron who collates. Possession of the benefice is completed by induction, which makes the church full against anyone, including the Crown. If the proper patron fails to exercise his right within six calendar months from the vacancy, the right devolves or lapses to the next superior patron, *e.g.*, from an ordinary patron to the bishop, and if he makes similar default to the archbishop, and from him on similar default to the Crown. If a bishopric becomes vacant after a lapse has accrued to it, it goes to the metropolitan; but in case of a vacancy of a benefice during the vacancy of the see the Crown presents. Until the right of presentation so accruing to a bishop or archbishop is exercised, the patron can still effectually present, but not if lapse has gone to the Crown. All benefices except those under the clear annual value of £50 pay their first fruits (one year's profits) and tenths (of yearly profits) to Queen Anne's Bounty for the augmentation for the maintenance of the poorer clergy. Their profits during vacation belong to the next incumbent. Tithe rent charge attached to a benefice is relieved from payment of one-half of the agricultural rates assessed thereon. Benefices may be exchanged by agreement between incumbents with the consent of the ordinary, and they may, with the consent of the patron and ordinary, be united or dissolved after being united. They may also be charged with the repayment of money laid out for their permanent advantage, and be augmented wholly by the medium of Queen Anne's Bounty.

Recent legislation has also affected the vacation of benefices by plurality, resignation, and deprivation. As regards plurality, by dispensation from the archbishop of Canterbury, two benefices may be held together, the churches of which are within four miles of each other, and the annual value of one of which does not exceed £200 (1885). As regards resignation, incumbents of seven years' standing, incapacitated by permanent mental or bodily infirmity from due performance of their duties, can resign their benefices and receive a pension not exceeding one-

third of the net income (1871-81). As regards deprivation under the Clergy Discipline Act 1892, an incumbent who has been convicted of offences against the law of bastardy, or against whom judgment has been given in a divorce or matrimonial cause, is deprived, and on being found guilty in the consistory court of immorality or ecclesiastical offences (not in respect of doctrine or ritual), he may be deprived or suspended or declared incapable of preferment.

(G. G. P.*)

Benevento, a town and archiepiscopal see and capital of the province of Benevento, Campania, Italy, situated amid the South Apennines, 78 miles by rail N.E. from Naples. There is a new suite of provincial offices. Brick-making, lime-burning, and rope-making are also carried on. Population of town (1881) 21,631, (1901) 24,650; of province (1881) 238,425, (1901) 257,101.

Benfey, Theodor (1809-1881), German philologist, son of a Jewish trader at Nörten, near Göttingen, was born on the 28th January 1809. His taste for philology was awakened in his youth by the careful instruction in Hebrew which he received from his father, and although originally designed for the medical profession, he resolved upon a literary career. After brilliant studies at Göttingen he spent a year at Munich, where he was greatly impressed by the lectures of Schelling and Thiersch, and afterwards settled as a teacher in Frankfort. His pursuits were at first chiefly classical, and his attention was diverted to Sanskrit by an accidental wager that he would learn enough of the language in a few weeks to be able to review a new book upon it. This feat he accomplished, and rivalled in later years when he learned Russian in order to translate Wasilieff's work on Buddhism. For the time, however, his labours were chiefly in classical and Semitic philology. At Göttingen, whither he had returned as privat-docent, he wrote a little work on the names of the Hebrew months, proving that they were derived from the Persian, prepared the great article on India in Ersch and Grüber's *Encyclopædia*, and published from 1839 to 1842 the *Lexicon of Greek Roots* which gained him the Volney prize of the Institute of France. From this time his attention was principally given to Sanskrit. He published in 1848 his edition of the *Sama Veda*; in 1852-54 his *Manual of Sanskrit*, comprising a grammar and chrestomathy; in 1858 his practical Sanskrit Grammar, afterwards translated into English; and in 1859 his edition of the *Pantscha Tantra*, with an extensive dissertation on the fables and mythologies of primitive nations. All these works had been produced under the pressure of poverty, the Government, whether from parsimony or from prejudice against his Jewish extraction, refusing to make any substantial addition to his miserable salary as extra-professor at the University. At length, in 1862, the growing appreciation of foreign scholars shamed it into making him an ordinary professor, and in 1866 Benfey published the laborious work by which he is, on the whole, best known, his great *Sanskrit-English Dictionary*. In 1869 he wrote a history of German philological research, especially Oriental, during the 19th century. In 1878 his jubilee as doctor was celebrated by the publication of a volume of philological essays dedicated to him, and written by the first scholars in Germany. He had designed to close his literary labours by a grammar of Vedic Sanskrit, and was actively preparing it when he was interrupted by a fatal illness, which terminated in his death at

Göttingen on 26th June 1881. A collection of his various writings was published in 1890, prefaced by a memoir by his son.
(R. G.)

Bengal, a province of British India, under the administration of a lieutenant-governor, situated in the north-east of the peninsula, occupying the lower valley of the Ganges. The total area (including native states) comprises 187,377 square miles. In 1891 the population

was 74,643,366, and in 1901 it was 78,448,735. The capital is Calcutta, which is also the capital of the Indian empire. The word "Bengal" is sometimes used in a narrower sense for the geographical area of Bengal proper, excluding Behar and Orissa. This use has its justification in the fact that here alone is the Bengali language spoken.

Population.—The following table gives the area and population of the several districts and native states of Bengal, according to the census of 1891:—

Area and Population of Bengal (1891).

Divisions.	Districts.	Area in Square Miles.	Number of Towns and Villages.	Population, Census of 1891.			Density of Population to Square Mile.
				Males.	Females.	Total.

Since 1881 the population increased by nearly 7 per cent., which was below the rate of increase for India generally. But this increase of population was unequally distributed. In some of the central and northern districts there was an actual decrease, attributed to the prevalence of malarial fever. In eastern Bengal, where the population is already very dense, the rate of increase was as high as 11 per cent. In the hilly country of Chota Nagpur, where some emigration prevails, the increase was 10 per cent. The extremely high rate of increase for native states (19 per cent., despite an actual decrease in Cooch Behar) may be ascribed to more accurate enumeration. Excluding the metropolitan districts of the Twenty-four Parganas and Hooghly, the greatest density of population is to be found in the Patna division, or Behar proper. Here two purely agricultural districts (Saran and Muzaffarpur) each support more than 900 persons on every square mile, being the highest density for all India. In Chota Nagpur the average density falls to 172 persons per square mile. Classified according to religion, and excluding native states, Hindus numbered 45,220,124, or 63·4 per cent. of the total population, as compared with 64·8 per cent. in 1881, showing that they increased less rapidly than other religions. Mahomedans numbered 23,437,591, or 32·85 per cent., being specially numerous in eastern Bengal, where in some districts they form more than two-thirds of the inhabitants. The fact that they have increased more than the Hindus is explained partly by conversion and partly by their healthier mode of life. They eat more meat, and marry later. The Christians numbered 190,829, or 27 per cent. Of these, 23,301 were Europeans, and 15,006 Eurasians, leaving 152,522 for native converts, who are most numerous in the Lohardaga district of Chota Nagpur. Buddhists and Jains together numbered 196,164, or 27 per cent. The Buddhists proper are almost confined to the half-Tibetan district of Darjiling and the half-Burmese district of Chittagong. The few Jains are traders residing chiefly in Calcutta and Murshidabad. Aboriginal tribes numbered 2,294,506, or 2·4 per cent. They are found chiefly in Chota Nagpur, the Sonthal Parganas, and the border districts of the Burdwan division. In the native states of Bengal the proportion of aboriginal tribes rises as high as 14 per cent. Jews numbered 1447; Sikhs, 412; and Parsis, 179; leaving 5735 for "others."

According to the preliminary returns of the census of 1901, the total population of Bengal amounted to 74,713,020 for British territory alone, showing an increase of nearly 5 per cent. In eastern Bengal the rate of increase was maintained; but there is an actual decrease in the thickly populated tracts of Behar. In the native states, which for the first time include Sikkim, the total population amounted to 3,735,715, showing an apparent increase of 13 per cent.

Crops.—Excluding Orissa, almost the entire area of Bengal was brought under the permanent settlement of Lord Cornwallis in 1793. Consequently, no agricultural statistics are available, as for the rest of India. The following figures are little better than conjectural. The total cultivated area is estimated at 55 million acres, of which 10 millions are cropped more than once. The staple crop almost everywhere is rice, grown on 40 million acres, while other food grains cover 15 million acres; oil-seeds, 4 million

acres; jute, 2 million; sugar-cane, 1 million; tobacco, 648,000; indigo, 555,000; opium, 235,000; cotton, 167,000; tea, 128,000. The two crops grown under European supervision are indigo and tea. Indigo-planting has decreased in Bengal proper, but is still an important industry in northern Behar. The crop is a very fluctuating one, the total out-turn having been 53,000 *maunds* in 1896-97, compared with 94,000 *maunds* in the next year. The following table gives the chief statistics of the tea industry for 1897, according to districts:—

District.	Number of Gardens.	Area of Gardens.	Area under Mature Plant.	Area under Immature Plant.	Out-turn of Manufactured Leaf.
		Acres.	Acres.	Acres.	lb.
Darjiling	186	55,822	43,538	7,234	11,597,256
Jalpaiguri	285	65,072	46,905	18,167	24,232,316
Chittagong	23	4,024	3,596	428	2,126,028
Chittagong Hill Tracts }	1	100	100	...	27,120
Hazaribagh	4	611	586	25	36,200
Lohardaga	21	2,438	2,429	9	931,695
Total	520	128,067	102,204	25,863	38,950,615

The tea industry is almost confined to the hills of Darjiling, and the submontane tract of the Dwars (or Docars) in Jalpaiguri. It is in the latter tract that most of the later extensions have taken place. The larger out-turn is apparently due to the leaf being sent here from Darjiling to be manufactured. The returns show 75,143 persons permanently employed, and a daily average of 52,444 persons temporarily employed. Cinchona is grown on Government plantations in the neighbourhood of Darjiling, and there manufactured into quinine. The total number of cinchona trees is about 2½ millions. In 1897-98 the crop amounted to 318,715 lb of dry bark. The output of the factory was 10,149 lb of sulphate of quinine and 4075 lb of cinchona febrifuge. The gross receipts amounted to Rs.1,76,798, a net profit of Rs.11,632.

Industries.—The chief coalfields of Bengal are near Raniganj in the Burdwan district, and at Karharbari and Giridih in Hazaribagh. The industry has progressed rapidly, not only supplying fuel to the local railways and factories, but also exporting it by sea. In 1898 the aggregate output of all the Bengal collieries was 3,622,090 tons, valued at Rs.96,87,250. The total number of persons employed was 48,604, of whom 14,709 were women and 2090 children. The following table gives the output for 1893-99, and also for earlier quinquennial periods:—

Year.	Output of Coal in Bengal. Tons.	Year.	Output of Coal in Bengal. Tons.
1878	957,243	1895	2,716,155
1883	1,200,957	1896	3,037,920
1888	1,380,594	1897	3,142,497
1893	1,902,866	1898	3,622,090
1894	2,035,944	1899	3,883,000

The only important ironworks are those of the Barrakur Company

near Raniganj, where iron ore and coal are found together. In 1898, the total output of pig-iron was 19,719 tons, of which 15,779 tons were sold and 8515 tons were consumed in the foundries.

Jute is grown throughout the marshes of Eastern Bengal. Apart from the quantity exported and the quantity made up by hand, it supports a prosperous mill industry, chiefly in the neighbourhood of Calcutta and Howrah. Jute presses, mostly worked by steam or hydraulic power, employ nearly 30,000 persons. The following table gives the chief statistics of jute mills in Bengal for 1895-98 :—

	No. of Mills.	No. of Looms.	No. of Spindles.	Persons Employed.				
				Men.	Women.	Young Persons.	Children.	Total.
1895-96	27	10,406	4,000,875	50,973	15,640	4082	6,923	77,618
1896-97	30	12,611	4,366,225	59,339	17,092	5649	9,174	91,254
1897-98	33	18,444	4,567,500	61,343	16,995	6023	10,405	94,766

In 1898, the number of cotton mills, all in the same neighbourhood, was ten, with 200 looms and 379,082 spindles, employing 11,739 hands. The total out-turn was nearly 45 million lb of yarn, chiefly of counts between 10 and 20, and 63,266 lb of woven goods, chiefly *dhutis*, *chadars*, and shirtings. There were also four paper mills, employing 3222 hands, with an out-turn of 33 million lb of paper, valued at Rs.49,72,850. The materials used are rags, jute, grasses, old gunny bags, &c., and paper of good quality is produced. The number of flour mills, large and small, was 25; of oil mills, 83; and of rice mills, 1.

Railways.—Bengal is well supplied with railways, which naturally have the seaport of Calcutta as the centre of the system. South of the Ganges, the East Indian follows the river from the North-Western Provinces, with its terminus at Howrah on the Hooghly, opposite Calcutta. A chord line passes by the coalfield of Raniganj, which enables this great railway to be worked more economically than any other in India. The Bengal-Nagpur, from the Central Provinces, also has its terminus at Howrah, and the section of this railway through Midnapur carries the East Coast line from Madras. North of the Ganges the Eastern Bengal runs north to Darjiling, and maintains a service of river steamers on the Brahmaputra. The Bengal Central serves the lower Gangetic delta. Both of these have their termini at Sealdah, an eastern suburb of Calcutta. Northern Behar is traversed by the Bengal and North-Western, with an extension eastwards through Tihut to join the Eastern Bengal. The Assam-Bengal railway will connect the Brahmaputra valley with the Bengal port of Chittagong. In addition there are a few light lines and steam tramways.

Canals and Rivers.—Rivers and other waterways still carry a large part of the traffic of Bengal, especially in the delta and along the Brahmaputra. The Government maintains two channels through the Sundarbans, known as the Calcutta and Eastern canals, and likewise does its best to keep open the Nadiya rivers, which form the communication between the main stream of the Ganges and the Hooghly. There is further a route by water between Calcutta and Midnapur. The most important canals, those in Orissa and on the Sone river in Southern Behar, have been constructed primarily for irrigation, though they are also used for navigation. The following table gives the financial results of the four chief irrigation schemes, classified as "major works," for 1897-98 :—

	Capital Outlay.	Revenue Receipts.	Working Expenses.	Simple Interest.	Excess Expenditure.	Loss per cent.
	Rs.	Rs.	Rs.	Rs.	Rs.	
Orissa Project	2,68,02,141	5,54,757	5,42,752	10,27,516	10,15,511	8.38
Midnapur Canal	84,65,427	2,75,636	2,41,831	3,31,130	2,97,325	8.51
Hijli Tidal Canal	26,15,242	92,210	40,167	1,02,063	50,020	1.93
Sone Project	2,67,91,549	12,66,974	6,30,326	10,37,108	4,00,460	1.49
Total	6,41,74,359	21,89,577	14,55,076	24,97,817	17,68,316	2.11

Various other "minor works," against which no interest is charged, show an excess revenue of Rs.2,20,720, being 1.78 per cent. on a capital outlay of Rs.1,23,81,671. Except as a protection against famine, expenditure on irrigation cannot be considered remunerative in Bengal.

Commerce.—The seaborne trade of Bengal is almost entirely concentrated at Calcutta, which serves also as the port of Assam and the North-Western Provinces. A small share is conducted at Chittagong and the Orissa ports. The following table gives the value of the total seaborne trade of the province, foreign and coasting, but exclusive of Government transactions, for the two years 1893-94 and 1897-98 :—

	1893-94. Rs.	1897-98. Rs.
Imports—		
Foreign	31,03,61,126	31,30,17,449
Coasting	6,23,26,924	8,66,26,161
Total	37,26,88,050	39,96,43,610
Exports—		
Foreign	42,26,18,585	46,31,20,317
Coasting	6,42,39,959	9,31,17,535
Total	48,68,58,544	55,62,37,852
Grand total	85,95,46,594	95,58,81,462

It will be observed that the foreign imports show hardly any change, while the foreign exports have improved by 9.5 per cent. The considerable increase in both branches of coasting trade is due mainly to the importation of rice from Burma on account of famine, and to the growing exportation of coal and jute manufactures. In foreign trade the rate of increase during a period of twenty years is 52 per cent. for imports, and 45 per cent. for exports. The principal imports are cotton piece goods, railway materials, metals and machinery, oils, sugar, cotton twist, salt. The principal exports are jute, tea, hides, opium, rice, oil-seeds, indigo, lac.

Internal trade.—The interprovincial trade of Bengal is carried on mostly with the North-Western and Central Provinces and with Assam. In 1897-98, the total imports by rail were valued at Rs.14,08,97,894, of which 66 per cent. came from the North-Western and 14 per cent. from the Central Provinces. The principal articles were opium, hides, raw cotton, wheat, shell-lac, and oil-seeds. The exports by rail were valued at Rs.12,26,27,407, of which 71 per cent. went to the North-Western and 13 per cent. to the Central Provinces. The principal articles were cotton piece goods (more than one-fourth of the total), rice, coal, gunny bags, iron and steel, unrefined sugar, kerosene oil, cotton twist, gram and pulse, tobacco, manufactured silk, raw silk, and salt. In 1897-98, the imports from Assam by river steamer were valued at Rs.5,05,74,823, almost entirely tea, with some oil-seeds and jute. The exports to Assam by river steamer were valued at Rs.2,95,84,768, chiefly cotton piece goods (nearly one-third of the total), rice, gram and pulse, salt, cotton twist, sugar, tobacco, and gunny bags. The imports from Assam by country boat were valued at Rs.1,27,10,294, chiefly rice (one-third of the total), oil-seeds, timber, limestone, hides, jute, mats, oranges, raw cotton, and dried fish. The exports into Assam by country boat were valued at Rs.88,50,073, chiefly sugar, spices, kerosene oil, tobacco, salt, gram and pulse, rice, provisions, dried fruit and nuts, and Indian piece goods. The frontier trade of Bengal is registered with Nepal, Sikkim and Tibet, and Bhutan, but, except with Nepal, the amount is insignificant. In 1897-98 the imports from Nepal were valued at Rs.1,45,97,183, chiefly rice (more than one-third), other food grains, oil-seeds, cattle, hides, tobacco, *ghae*, and timber. The exports into Nepal were valued at Rs.1,46,54,634, chiefly silver (more than one-fifth), cotton piece goods, salt, tobacco, spices, brass and copper, provisions, sugar, betel-nuts, and iron.

Administration.—The administration of Bengal is conducted by a lieutenant-governor, with a chief secretary, two secretaries, and three under-secretaries. There is no executive council, as in Madras and Bombay; but there is a board of revenue, consisting of two members. For legislative purposes the lieutenant-governor has a council of twenty members, of whom not more than ten may be officials. Of the remaining members seven are nominated on the recommendation of the Calcutta corporation, groups of municipalities, groups of district boards, selected public associations, and the senate of Calcutta university. The number of divisions or commissionerships is 9, of which Chota Nagpur ranks as "non-regulation." The number of districts is 44, excluding the cities of Calcutta and Howrah. The total number of civil and revenue judges is 380, and of magistrates of all kinds, 2739. In 1898 the sanctioned strength of the district police was 23,788 of all ranks. In addition, the railway police numbered 654, and the military police 300. These numbers give a proportion of one policeman to every 2880 of the population, a much lower proportion than for India generally. The village police, or *chaukidars*, number about 160,000.

Army.—Since the reorganization of the Indian army in 1895, the Bengal command, under a lieutenant-general, comprises all Northern India, except the Punjab. It consists of two first-class and six second-class districts, of which only one—the Presidency district—lies wholly within the province of Bengal. Apart from Fort William and Barrackpur, near Calcutta, the only other important military station is Dinapur, near Patna, which is included in the Allahabad district. In 1898 the strength of the Bengal command was 23,252 European and 31,822 native troops—total 55,074. In addition there were 13,085 enrolled volunteers.

Local Government.—Excluding Calcutta the number of municipalities in Bengal is 151. The number of persons within municipal

limits is 2,722,000, or less than 4 per cent. of the total population. The number of electors is 469,000, or about one in six of the inhabitants. The municipalities vary in size, from Patna with 168,000 persons to Nalchiti with only 1675; the majority, however, have between 5000 and 15,000. The rule is that two-thirds of the municipal commissioners shall be elected by the ratepayers. But in a few cases (27 in all) the Government exercises the right of nomination. Out of a total of 2183 commissioners, 1172 are elected and 1011 nominated; 349 are officials and 1834 non-officials; 1949 are Indians and 234 Europeans. The classes most numerously represented are lawyers, landholders, merchants, doctors, and schoolmasters. In 1897-98, the aggregate municipal income was Rs.33,00,000, of which Rs.26,79,000 was derived from taxation, the average incidence of taxation being nearly R.1 per head. The aggregate expenditure was Rs.36,00,000, of which Rs.10,68,000 was devoted to conservancy, Rs.5,04,000 to buildings and roads, Rs.3,76,000 to water-supply and drainage, Rs.3,62,000 to hospitals and vaccination, Rs.2,82,000 to police, lighting, and fire prevention, and Rs.1,82,000 to education.

The number of district boards is 38, and of local boards 104. These bodies possess no power of taxation, but administer certain funds made over to them for expenditure on roads and bridges, education, hospitals, &c. On the district boards the number of members is 794, of whom 328 are elected by the local boards. On the local boards the number of members is 1253, of whom 413 are elected. Of the total number of both (2047), 1635 are non-officials, and 1761 are Indians. In 1897-98, the total income of the boards was Rs.65,80,000, of which Rs.39,20,000 was derived from road cess, Rs.12,20,000 from tolls at ferries, &c., Rs.4,70,000 from fees at cattle pounds, &c., and Rs.5,40,000 from a Government grant. The total expenditure was Rs.69,10,000, of which Rs.37,90,000 was devoted to roads, bridges, &c., Rs.12,00,000 to education, Rs.3,00,000 to hospitals, and Rs.2,60,000 to sanitation and water-supply.

Revenue and Expenditure.—The net revenue of Bengal for 1897-98 (in tens of rupees), was Rx.14,340,376, classified thus: Imperial, Rx.10,051,972; provincial, Rx.3,783,460; local, Rx.504,944. The net expenditure for the same period was Rx.4,375,988: Imperial, Rx.3,7584; provincial, Rx.3,670,721; local, Rx.617,688. Of the total revenue, Rx.3,945,951 was derived from land, Rx.2,443,364 from salt, Rx.1,759,285 from stamps, Rx.1,444,919 from customs, and Rx.1,278,766 from excise.

Education.—The following table gives the chief statistics of education in Bengal for the three quinquennial years, 1886-87, 1891-92, and 1896-97:—

	1886-87.		1891-92.		1896-97.	
	Schools.	Pupils.	Schools.	Pupils.	Schools.	Pupils.
Colleges . .	89	4,611	48	6,287	56	8,278
Secondary Schools	2,235	184,819	2,869	202,684	2,532	224,094
Primary Schools	50,667	1,122,286	51,269	1,175,962	52,854	1,807,867
Special Schools	180	5,378	270	7,488	198	8,859
Private Institutions	4,221	45,508	13,868	139,594	12,207	126,182
Total . .	57,342	1,362,102	67,824	1,581,965	67,847	1,674,775

These figures show fair progress, particularly in colleges, secondary, and primary schools. The general rate of increase in pupils was 12 per cent. during the first quinquennium, and 9 per cent. during the second, which is in both cases somewhat below the rate of increase for India generally. If we compare the number of pupils with the estimated population of school-going age (15 per cent. of the total population), the increase in ten years has been from 13.3 to 15.2 per cent. Taking girls alone, the number at school increased from 88,731 in 1891-92 to 105,919 in 1896-97, or by 19 per cent., while the proportion to the female population of school-going age rose from 1.61 to 1.93 per cent. Expenditure on education increased from Rs.78,373 in 1886-87 to Rs.1,09,68,635 in 1896-97. The total expenditure has increased faster than the total number of pupils, the rate of increase being 19 per cent. in the first quinquennium, and 17 per cent. in the second. But by far the larger share of this increase has come from fees and "other sources," chiefly missionary contributions and subscriptions. Altogether, the proportion of the total expenditure borne by public funds fell in ten years from 40.8 to 36.1 per cent. In secondary schools alone public funds contribute less than one-fifth.

Public Calamities.—Bengal has been fortunate in escaping to a great extent the two calamities of famine and plague which recently afflicted Central and Western India. The drought of 1896-97 did indeed extend to Bengal, but not to such an extent as to cause actual famine. The distress was most acute in the densely populated districts of Northern Behar, and in the remote hills of Chota Nagpur. Reducing the persons relieved to terms of one day, the net result of the operations from first to last shows that in the fifteen affected

districts 61,018,611 individuals were employed on works for one day, and 70,783,120 were fed gratuitously. The total expenditure on famine relief amounted to Rs.1,08,03,758, of which Rs.63,00,000 were spent on wages and Rs.32,00,000 on food. Plague first appeared at Calcutta in a sporadic form in April 1898, but down to April of the following year the total number of deaths ascribed to plague throughout the province was less than 1000, compared with 191,000 for Bombay. At the beginning of 1900, however, there was a serious recrudescence of plague at Calcutta, and a very malignant outbreak in the district of Patna, which caused 1000 deaths a week. In the early months of 1901, plague again appeared in the same regions. During 1900 the total number of deaths from plague in Bengal was 37,265, and during the first three months of 1901 as many as 52,402 deaths had occurred. The earthquake of 12th June 1897, which had its centre of disturbance in Assam, was felt throughout eastern and northern Bengal. In all the large towns the masonry buildings were severely damaged or totally wrecked. The permanent way of the railways also suffered. The total cost of repairs to Government buildings alone was estimated at Rs.13,00,000, while the losses to private individuals may have amounted to a crore of rupees (say, £666,000). The total number of deaths returned was only 135. Far more destructive to life was the cyclone and storm-wave that broke over Chittagong district on the night of 24th October 1897. Apart from damage to shipping and buildings, the low-lying lands along the coast were completely submerged, and in many villages half the inhabitants were drowned. The loss of human lives was reported to be about 14,000, and the number of cattle drowned about 15,000. As usual in such cases, a severe outbreak of cholera followed in the track of the storm-wave. Another natural calamity on a large scale occurred at Darjiling in October 1899. Torrential rains caused a series of landslips, carrying away houses and breaking up the hill railway. The loss of life was returned at 300, including several English school children, and the value of property destroyed at Rs.25,00,000. (J. S. Co.)

Benghazi. See TRIPOLI.

Benguella, or SÃO FILIPE DE BENGUELLA, a town of Portuguese West Africa, capital of district Benguella, stands on a bay of the same name, and is connected with its emporium, Catumbella, by a railway. Population, 2500. The district of Benguella exports spirits, cotton, india-rubber, wax, cocoanuts, hides, gums, ivory, salt, &c.—the principal being india-rubber (£358,200 in 1896). The total trade increased from £186,900 in 1886 to £669,100 in 1896, and £534,666 in 1899.

Beni, a department of Bolivia. Occupying the N.E. part of the republic and extending to the Rio Beni which is its west boundary, it borders on the department of La Paz and the territory of Madre de Dios. The river Guaporé forms its boundary to the east where it touches Brazil. To the south its limits are the departments of Cochabamba and Santa Cruz. Its area is 100,580 square miles. The population in 1893 numbered 25,760, and in 1898, 18,640, mostly Indians. The capital, Trinidad (5000), is situated on the Mamore. The department is divided into three provinces. In 1898 there were 24 schools with 700 pupils.

Benin.—The old kingdom of Benin has been incorporated in Southern Nigeria. Few Europeans visited Benin city in the period 1875 to 1891. Consul Annesley saw the king in 1890 with the hopes of making a treaty, but failed in his object. In March 1892 Captain Vice-Consul Gallwey (now Lieut.-Colonel H. L. Gallwey, C.M.G., D.S.O.) succeeded in concluding a treaty with the king Overami. The treaty, however, proved of no avail, and the king kept as aloof as of old from any outside interference. In January 1897, the Acting Consul-General J. R. Phillips and eight Europeans were brutally massacred on the road from Gwato to Benin city whilst on a mission to the king. A punitive expedition (see below) was organized under the command of Admiral Sir Harry Rawson, K.C.B., and the city was assaulted and captured on 18th February 1897. The king and chiefs responsible for the massacre having been placed on their trial by Sir Ralph Moor, K.C.M.G., the king was deposed, and deported to

Old Calabar, and the chiefs, six in all, were executed. The chief offender was not brought to justice until a second punitive expedition in 1899 completed the pacification of the country. After the removal of the king in September 1897, a council of chiefs was appointed. This council carries on the government of the whole Beni country, and is presided over by the Resident. Up to 1897 the only trade product allowed by the king was palm oil. Now an extensive trade is done in oil, kernels, timber, ivory, rubber, &c. In the rubber and timber industries great strides have been made. The rubber forests can only be worked under license and regulations protecting the trees and vines from damage and destruction, and a close season of six months in every year is enforced. To the considerable advantage of native owners Europeans take out timber concessions, the maximum extent of a concession being 9 square miles. A commodious Residency, built of bricks and timber procured on the spot, has been erected in the city, and a military post and prison were established there in 1897. Great attention is paid to the sanitary condition of the town. The chiefs and people are rebuilding their houses, and are generally contented with the new order of things. The roads round about are kept in good condition; rubber nurseries have been started; and Government reservations for elephants will be arranged for. The population of the city of Benin is about 5000.

(H. L. G.)

The British Expedition of 1897.—This expedition was a remarkable example of good organization hastily improvised. The news of the massacre of Mr Phillips's party reached Rear-Admiral Rawson, the commander-in-chief on the Cape station, on 4th January 1897. The flagship *St. George* was at Simons Town. The small craft were dispersed. The *Theseus* and *Forte* at Malta had been ordered to join the Cape command. The *Malacca* transport was chartered in the Thames for the purposes of the expedition. In twenty-nine days a force of 1200 men, coming from three places between 3000 and 4500 miles from the Benin river, was landed, organized, equipped, and provided with transport. Five days later the city of Benin was taken, and in twelve days more the men were re-embarked, and the ships coaled and ready for any further service. This feat is probably unique. The plan of operations was to move upon Benin in a single column from Warrigi, making demonstrations at Gwato and Sapobar in order to distract the attention of the Beni from the main advance. Four companies of Hausas from the force of the Niger Company Protectorate preceded the naval expedition, and were employed in making a road 7 miles long between Warrigi and Ceri on Ologbo Creek. Fifty native scouts were raised at Lagos and rendered useful service. About 800 carriers were obtained from the tribes in the neighbourhood of New Benin. On 11th February the admiral with the bluejackets and marines landed at Warrigi, and marched to Ceri. On the following day an advanced party of bluejackets and Hausas with two Maxim guns proceeded up the creek, and landing at Ologbo were soon afterwards fired on from the thick bush. On the 14th the advance guard under Lieutenant-Colonel Hamilton moved 5 miles in the direction of Benin, being constantly under fire. Agagi, 4 miles farther, was reached on the 15th after further fighting. Here the expected water supply was not found, and as it was necessary to carry at least three days' supply, together with five days' rations, the expedition had to be reorganized, and to leave behind every man not absolutely necessary. On the 16th a fresh start was made, the Beni constantly firing from the bush and being dislodged by volleys and the Maxims. On the 17th Benin was occupied after further fighting. Some rockets fired at random in the supposed direction of the

town fell in the Juju compound and created a panic, which caused the place to be abandoned. On the following day the much-needed water was obtained. The town, which was found to be reeking of human sacrifices, was partly burned, and on the 22nd the expedition started on its return, leaving the Hausas in possession. Meanwhile the *Philomel*, *Barrosa*, and *Widgeon* anchored off the entrance to Gwato Creek on the 8th, and on the 9th an advance in boats was made under Captain O'Callaghan, R.N. Gwato was found deserted on the 10th, and was burned after an hour's engagement with the Beni. The *Phæbe*, *Alecto*, and *Magpie* supplied a force under Captain M'Gill, R.N., which occupied Sapobar on the 9th, and was attacked on the 20th. The total losses of the expedition were 10 killed, including 2 officers (Lieut.-Commander Pritchard and Surgeon Fyffe), and 32 wounded, including 5 officers. Staff-Surgeon Way died of sunstroke at Warrigi. The operations, though brief, threw a heavy and continuous strain upon the forces. Their marked success was due to the excellent organization devised by the naval officers and to the great care bestowed upon details. King Duboar of Benin was subsequently captured, and the country has quietly passed under British administration. The reign of wholesale murder has ended, and trade is developing in what was once the worst human shambles of Africa.

(G. S. C.)

Benjamin, Judah Philip (1811-1884), Anglo-American lawyer, of Jewish descent, was born a British subject at St Croix in the West Indies on the 11th of August 1811, and was successively an American lawyer, a leading Confederate politician, and a distinguished English barrister. He eventually died in Paris a domiciled Frenchman. After 1815 his parents lived in Wilmington, North Carolina, and he went to Yale in 1825 for his education, but left without taking a degree, and entered an attorney's office in New Orleans. He was admitted to the New Orleans bar in 1832. He compiled with his friend Slidell a valuable digest of decisions of the Supreme Courts of New Orleans and Louisiana; and as a partner in the firm of Slidell, Benjamin, and Conrad, he enjoyed a good practice. In 1848 he was admitted a councillor of the Supreme Court, and in 1852 he was elected a senator for Louisiana, from which date he took an active part in politics, declining to accept a judgeship of the Supreme Court. In 1861 he withdrew from the Senate, left Washington, and actively espoused the Confederate cause. He joined Jefferson Davis's provisional government as attorney-general, becoming afterwards his secretary for war (1861-62), and chief secretary of state (1862-65). Although at times subject to fierce criticism with regard to matters of administration and finance, he was recognized as one of the ablest men on the Confederate side, and he remained with Jefferson Davis to the last, sharing his flight after the surrender at Appomattox, and only leaving him shortly before his capture, because Benjamin found himself unable to go farther on horseback. He escaped from the coast of Florida in an open boat, and after many vicissitudes reached Liverpool, England, an exile. Shortly afterwards his remaining property was lost in the failure of Overend and Gurney.

In London Benjamin was able to earn a little money by journalism, and on the 13th of January 1866 he entered Lincoln's Inn. He received a hospitable welcome from the English legal profession. The influence of English judges who knew his abilities and his circumstances enabled him to be called to the bar on the 6th of June 1866, dispensing with the usual three years of studentship, and he acquired his first knowledge of the practice and methods of English courts as the pupil of Mr C. E. Pollock (after-

wards Baron Pollock). Mr Pollock fully recognized his abilities and they became firm friends during their joint lives. Benjamin was naturally an apt and useful pupil; for instance, an opinion of Mr Pollock, which for long guided the London police in the exercise of their right to search prisoners, is mentioned by him as having been really composed by Benjamin during his pupillage. Benjamin joined the Northern Circuit, and a large proportion of his early practice came from solicitors at Liverpool who had correspondents in New Orleans. His business gradually increased, and having in 1872 received a patent of precedence, he was on the 2nd of November in that year called within the bar as a Queen's Counsel. In addition to his knowledge of law and of commercial matters he had considerable eloquence, and a power of marshalling his facts and his arguments that rendered him extremely effective, particularly before judges. He was less successful in addressing juries, and for some time towards the close of his career did not take *Nisi prius* work, but in the Court of Appeal and House of Lords and before the Judicial Committee of the Privy Council he enjoyed a very large practice, making for some time fully £15,000 a year. The question of raising him to the bench was seriously considered by Lord Cairns, who, however, seems to have thought that the ungrudging hospitality and goodwill with which Benjamin had been received by the English legal profession had gone far enough. For some time towards the close of his career symptoms of diabetes and cardiac weakness manifested themselves in Benjamin, much as they did in Sir George Jessel, another great Jewish lawyer who died a year before him, and he suffered from the results of a fall from a tramcar in Paris, where he had built himself a house, and where he used to spend his vacations with his wife, who was a Frenchwoman. He retired to Paris at Christmas in 1882 and never returned to his practice, his medical advisers having ordered him absolute rest. He only came back to London in order to be entertained by the bench and bar of England at a banquet in the Inner Temple Hall on the 30th of June 1883; and he died at Paris on the 6th of May 1884.

In person J. P. Benjamin was thick-set, stout, and Jewish-looking, with a close-cut beard and an expression of great shrewdness. An early portrait of him is to be found facing page 242 in Jefferson Davis's *Rise and Fall of the Confederate Government*. His political history may be traced in that work, and in American histories and articles dealing with the period in which he was prominent, such as Draper's *American Civil War*, von Holst's *Constitutional History of the United States*, and Stephens's *History of the United States*. Many allusions to his English career will be found in works describing English lawyers of his period, and there are some interesting reminiscences of him by Baron Pollock in the *Fortnightly Review* for March 1898. A portrait of him in his later life was painted by Piercy and engraved by Roffe. His *Treatise on the Law of Sale of Personal Property with References to the American Decisions and to the French Code and Civil Law*—a bulky volume known to practitioners as *Benjamin on Sales*—is the principal text-book on its subject, and a fitting monument of the author's career at the English bar, of his industry and learning. Many of the speeches made by him during his American career have been published. (E. A. AB.)

Bennigsen, Rudolph von (1824—), German politician, was born at Lüneburg on the 10th of July 1824. He was descended from an old Hanoverian family, his father being an officer in the Hanoverian army, who rose to the rank of general, and also held

diplomatic appointments. Bennigsen, having studied at the University of Göttingen, entered the Hanoverian civil service. In 1855 he was elected a member of the second chamber; and as the Government refused to allow him leave of absence from his official duties he resigned his post in the public service. He at once became the recognized leader of the Liberal opposition to the reactionary Government, but must be distinguished from Count Bennigsen, a member of the same family, and son of the distinguished Russian general, who was also one of the parliamentary leaders at the time. What gave Bennigsen his importance not only in Hanover, but throughout the whole of Germany, was the foundation of the National Verein, which was due to him, and of which he was president. This society, which arose out of the public excitement created by the war between France and Austria, had for its object the formation of a national party which should strive for the unity and the constitutional liberty of the whole Fatherland. It united the moderate Liberals throughout Germany, and at once became a great political power, notwithstanding all the efforts of the governments, and especially of the king of Hanover, to suppress it. In 1866 Bennigsen used all his influence to keep Hanover neutral in the conflict between Prussia and Austria, but in vain. He took no part in the war, but his brother, who was an officer in the Prussian army, was killed in Bohemia. In May of this year he had an important interview with Bismarck, who wished to secure his support for the reform of the Confederation, and after the war was over at once accepted the position of a Prussian subject, and took his seat in the Diet of the North German Confederation and in the Prussian parliament. He used his influence to procure as much autonomy as possible for the province of Hanover, but was a strong opponent of the Guelph party. He was one of the three Hanoverians, Windthorst and Miquel being the other two, who at once won for the representatives of the conquered province the lead in both the Prussian and German parliaments. The National Verein, its work being done, was now dissolved; but Bennigsen was chiefly instrumental in founding a new political party—the National Liberals,—who, while they supported Bismarck's national policy, hoped to secure the constitutional development of the country. For the next thirty years he was president of the party, and was the most influential of the parliamentary leaders. It was chiefly owing to him that the building up of the internal institutions of the empire was carried on without the open breach between Bismarck and the parliament, which was often imminent. Many amendments suggested by him were introduced in the debates on the constitution; in 1870 he undertook a mission to South Germany to strengthen the national party there, and was consulted by Bismarck while at Versailles. It was he who brought about the compromise on the Military Bill in 1874. In 1877 he was offered the post of vice-chancellor with a seat in the Prussian ministry, but refused it because Bismarck or the king would not agree to his conditions. From this time his relations with the Government were less friendly, and in 1878 he brought about the rejection of the first Socialist Bill. In 1883 he resigned his seat in parliament owing to the reactionary measures of the Government, which made it impossible for him to continue his former co-operation with Bismarck, but returned in 1887 to support the coalition of national parties. One of the first acts of the Emperor William II. was to appoint him president of the province of Hanover. In 1897 he resigned this post and retired from public life.

Bennington, capital of Bennington county,

Vermont, U.S.A., situated in the south-western part of the state, on Hoosic river, and traversed by the Bennington and Rutland railway. It contains three villages: Bennington, North Bennington, and Bennington Centre. It was here that General Stark, at the head of a body of Green Mountain boys, gained a notable victory over a detachment of General Burgoyne's army in 1777. Population of the town (1890) 6391, (1900) 8033; of the village (1890) 3971, (1900) 5656.

Benoit, Peter Leonard Leopold (1834-1901), composer and leader of the Flemish musical movement, was born 17th August 1834, at Harlebecke in Flanders. His father and a local village organist were his first teachers. In 1851 Benoit entered the Brussels Conservatoire, where he remained till 1855, studying chiefly under Fétis. During this period he composed music to many melodramas, and to an opera *Le Village dans les Montagnes* for the Park Theatre, of which in 1856 he became conductor. He won a Government prize and a money grant in 1857 by his cantata *Le Meurtre d'Abel*, and this enabled him to travel through Germany. In course of his journeyings he found time to write a considerable amount of music, as well as an essay *L'Ecole de Musique Flamande et son Avenir*. Fétis loudly praised his *Messe Solennelle*, which Benoit produced at Brussels on his return from Germany. In 1861 he visited Paris for the production of his opera *Le Roi des Aulnes* ("Erlkönig") which, though accepted by the Théâtre Lyrique, was never mounted; while there he conducted at the Bouffes-Parisiens. Again returning home, he astonished a section of the musical world by the production at Antwerp of a sacred tetralogy, consisting of his *Cantate de Noël*, the above-mentioned *mass*, a *Te Deum*, and a *Requiem*, in which were embodied to a large extent his theories of Flemish music. By prodigious efforts he succeeded in gathering round him a small band of enthusiasts, who affected to see with him possibilities in the foundation of a school whose music should differ completely from that of the French and German schools. In its main features this school failed, for its faith was pinned to Benoit's music, which is hardly more Flemish than French or German. Benoit's more important compositions include the Flemish oratorios *De Schelde* and *Lucifer*, the latter of which met with complete failure on its production in London in 1888; the operas *Het Dorp int Gebirge* and *Isa*, the *Drama Christi*; an enormous mass of songs, choruses, small cantatas, and motets. Benoit also wrote a great number of essays on musical matters, notably on his favourite theme of Flemish music. He died at Antwerp on the 8th of March 1901. (R. H. L.)

Bensberg, a village of Prussia, in the Rhine province, 12 miles by rail E. from Cologne. Here is a castle (now cadet college), built by the Elector John William of the Palatinate in 1705. It has iron, lead, zinc, and silver mines. Population (1885), 10,269; (1900), 10,400.

Benson, Edward White (1829-1896), Archbishop of Canterbury, was born on 14th July 1829 at Birmingham. He came of a family of Yorkshire dalesmen, his father, whose name was also Edward White, being a manufacturing chemist of some note; his mother's maiden name was Harriet Baker. He was educated at King Edward VI's School, Birmingham, under James Prince Lee, afterwards Bishop of Manchester, and amongst his school-fellows were B. F. Westcott and J. B. Lightfoot, both of whom preceded him to Trinity College, Cambridge, where he was elected a sub-sizar in 1848, becoming subsequently sizar and scholar. The death of a favourite sister in 1850, of typhus, was followed two days afterwards by that of his widowed mother; and as her income consisted almost

entirely of an annuity, the youth found himself almost without resources, with a family of younger brothers and sisters dependent upon him. Relations came to his aid (though he refused the offer made by his mother's brother, a devout Unitarian, to adopt one of the children and bring him up as his heir), and presently his anxieties were relieved by Francis Martin, bursar of Trinity, who gave him liberal aid, and treated him ever afterwards as a son. Benson took his degree in 1852 as a senior optime, eighth classic, and senior chancellor's medallist, and was elected Fellow of Trinity in the following year. He became a master at Rugby, first under Dr Goulburn, and then (1857) under Dr Temple, who became his life-long friend; he was also ordained deacon in 1854 and priest in 1856. From Rugby he went, on Dr Temple's recommendation, to be the first headmaster of Wellington College, which was opened in January in 1859; and in the course of the same year he married his cousin, Mary Sidgwick (sister of Professor Henry Sidgwick), to whom he had long been devotedly attached. Wellington College made him widely known, provided a scope for his enthusiastic love of teaching, and developed his administrative abilities; it grew rapidly under his headship, and to him it was due that, instead of becoming merely "a kind of military academy for army preparation," it took its place as a great English public school. By degrees his thoughts began to turn towards other work. His appointment to the prebendal stall of Heydour in Lincoln Minster (1868) gave him an office in a great cathedral chapter, towards which he had always felt greatly drawn; and as examining chaplain to Bishop Christopher Wordsworth he came into close contact with candidates for holy orders. For a short time also, in 1870, he held the same office for Dr Temple, just appointed to the see of Exeter. In 1872 came an offer of the chancellorship of Lincoln; his acceptance of it brought his school work to an end, and opened a new period of his life. As chancellor, the statutes directed him to study theology, to train others in that study, and to oversee the educational work of the diocese. To such work Benson at once devoted himself; and it is not too much to say that through his personal efforts and his studies he did more perhaps than any other man to reinvigorate cathedral life in England. He started a theological college (the *Scholæ Cancellarii*), which has had a prosperous career; he founded night schools, he delivered courses of lectures on church history, and held bible-classes; he was instrumental in founding a society of mission preachers for the diocese, the "Novate Novale;" and owing to his influence a general mission was held in the city of Lincoln in the spring of 1876.

In the winter of the same year he was offered and accepted the newly-constituted see of Truro; he was consecrated on St Mark's Day 1877, and enthroned in St Mary's Church at Truro on 1st May. The "brand-new bishop," as he was called by John Bright, threw himself into his work with characteristic vigour. Cornwall was to him "a land of wonderment, historical, physical, spiritual"; he soon came to know it well, and showed a remarkable power of grappling with its peculiar religious conditions. His knowledge, his sympathy, his enthusiasm made themselves felt everywhere, and by degrees he won the warm affection of the Cornish people. The new diocese was organized rapidly, the ruridecanal conferences of clergy became a real force, and the church life of Cornwall came to have a strength and solidity that had never been possible when it was merely a part of the huge unwieldy diocese of Exeter. A chapter was constituted, the bishop being dean; amongst its members was a canon missionary (the first to be appointed in England), and the *Scholæ Cancellarii* were founded after the Lincoln pattern. Moreover, the

bishop at once set to work to build a cathedral, and the efforts which were made to raise the necessary funds did perhaps more than anything else to draw the whole diocese together. The foundation-stone was laid on 20th May 1880, and the work went steadily forward. The south or Benson transept commemorates his episcopate; and on 3rd November 1887 the cathedral, so far as then completed, was consecrated. The nave will commemorate his primacy.

Archbishop Tait died on 3rd December 1882, and, to the joy of most church-people, Dr Benson was nominated as his successor: his election by the chapter of Canterbury was confirmed on 3rd March 1883, and he was enthroned on 29th March. It may be said without hesitation that his primacy was one of almost unprecedented activity, and that he bore the lion's share of all that was done. No Archbishop of Canterbury since the Reformation exercised such an influence outside the British Isles as he did. Frequent communications passed between him and the heads of the Eastern Churches. With their cordial approval a bishop was again consecrated, after six years' interval (1881-87), to have charge over the Anglican congregations in Jerusalem and the East; and the features which had formerly made the plan objectionable to many English churchmen were now abolished. In 1886, after much careful investigation, he founded the "Archbishop's Mission to the Assyrian Christians," having for its object the instruction and the strengthening from within of the "Nestorian" churches of the East [NESTORIAN CHURCH]. An interchange of courtesies with the Metropolitan of Kiev, on the occasion of the 900th anniversary of the conversion of Russia (1888), led to further intercourse, which has already done much to bring about a better understanding between the English and Russian churches. With regard to the Roman Communion his action was perhaps less happy. In 1894 the Abbé Portal (who, in common with many other French clergy, had been led by his studies to accept the validity of English orders) was in England, and an interview was sought on his behalf with Dr Benson, in which the question was discussed of a possible *rapprochement* with the Papacy. The Archbishop refused to take any part in such a plan, and subsequent events only showed the wisdom of this course. But there were many who felt that, then as at other times, some act of courtesy on the part of the English primate might have smoothed the way for possible action in the future. With the other churches of the Anglican Communion (*q.v.*) the Archbishop's relations were cordial in the extreme, and grew ever closer as time went on. Particular questions of importance, the Jerusalem bishopric, the healing of the Colenso schism in the diocese of Natal, the organization of native ministries, and the like, occupied no small part of his time; and although he held unflinchingly to all the accustomed rights and prerogatives of his see, he did all in his power to foster the growth of local churches. But it was the work at home which occupied most of his energies. That he in no way slighted diocesan work had been shown at Truro. He complained now that the bishops were "bishops of their dioceses but not bishops of England," and did all he could to make the Church a greater religious force in English life. He sat on the Ecclesiastical Courts Commission (1881-83) and the Sweating Commission (1888-90). He brought Bills into Parliament to reform Church Patronage and Church Discipline, and worked unremittingly for years in their behalf. The latter became law in 1892, and the former was merged in the Benefices Bill, which passed in 1898, after his death. He wrote and spoke vigorously against Welsh Disestablishment (1893); and in the following year, under his guidance, the existing agencies for Church Defence were consolidated, and greater stress was laid upon

proper instruction than had previously been the case. He was largely instrumental in the inauguration of the House of Laymen in the province of Canterbury (1886); he made diligent inquiries as to the internal order of the Sisterhoods of which he was visitor; from 1884 onwards he gave regular Bible readings for ladies in Lambeth Palace Chapel. But the most important ecclesiastical event of his primacy was undoubtedly the judgment in the case of the Bishop of Lincoln [LINCOLN JUDGMENT], in which the law of the prayer-book is investigated, as it had never been before, from the standpoint of the whole history of the English Church. In 1896 the Archbishop paid a long-promised visit to Ireland, to see the working of the sister Church. He was received with enthusiasm, but the work which his tour entailed over-fatigued him. On Sunday morning, 11th October, just after his return, whilst on a visit to Mr Gladstone, he expired in Hawarden Parish Church of heart failure, just as the Absolution was said at Mattins.

Archbishop Benson left numerous writings, including a valuable essay on *The Cathedral* (London, 1878), and various charges and volumes of sermons and addresses. But his two chief works, posthumously published, are his *Cyprian* (London, 1897), a work of great learning, which had occupied him at intervals since early manhood; and *The Apocalypse, an Introductory Study* (London, 1900), interesting and beautiful, but limited by the fact that the method of study is that of a Greek play, not of a Hebrew apocalypse. The Archbishop's knowledge of the past was both wide and minute, but it was that of an antiquary rather than of an historian. "I think," writes his son, "he was more interested in modern movements for their resemblance to ancient than *vice versa*." His sermons are very noble, written in a style which is over-compressed and often obscure, but full of love, of faith, of large-heartedness. He was a hymn-writer of a high order, as may be seen, for example, in "O Throned, O Crowned" and "The Splendours of Thy Glory, Lord," which he wrote for the *Wellington College Hymn-book*, which he edited, and in his beautiful version of *Urbs Beata*. His "grandeur in social function" was unequalled, and his interests were very wide. But above all else he was a great ecclesiastic. He paid less attention to secular politics than Archbishop Tait; but if a man is to be judged by the effect of his work, it is Benson, and not Tait, who should be described as a great statesman. His biography, by his son, reveals him as a man of devout and holy life, impulsive indeed and masterful, but one who learned self-restraint by strenuous endeavour.

A. C. BENSON. *Life of Archbishop Benson*, 2 vols. London, 1899.—J. H. BERNARD. *Archbishop Benson in Ireland*, 1897.—*Quarterly Review*, Oct. 1897, art. "Archbishop Benson" (by L. T. Dibdin). (W. E. Co.)

Bentham, George (1800-1884), British botanist, was born at Stoke, near Portsmouth, England, 22nd September 1800. His father, Sir Samuel Bentham, was the only brother of Jeremy Bentham, the publicist, and of scarcely inferior ability though in a different direction. Devoting himself in early life to the study of naval architecture, Sir Samuel went to Russia to visit the naval establishments in the Baltic and Black Seas. He was induced to enter the service of the Empress Catherine II., built a flotilla of gunboats and defeated the Turkish fleet. For this he was made, in addition to other honours, a colonel of a cavalry regiment. On the death of the Empress he returned to England to be employed by the Admiralty, and was sent (1805-07) again to Russia to superintend the building of some ships for the British navy. He attained the rank, under the Admiralty, of inspector-general of Naval Works. He introduced a multitude of improvements in

naval organization, one of the most remarkable being the invention with Marc Isambard Brunel, whom he brought to England, of the machinery for making pulley-blocks. His son, George Bentham, had neither a school nor college education, but early acquired the power of giving sustained and concentrated attention to any subject that occupied him—an essential condition of the success he attained as perhaps the greatest systematic botanist of the 19th century. Another was his remarkable linguistic aptitude. At the age of six to seven he could converse in French, German, and Russian, and he learnt Swedish during a short residence in Sweden, when little older. At the close of the war with France, the Benthams made a long tour through that country, staying two years at Montauban, where Bentham studied Hebrew and mathematics in the Protestant Theological School. They eventually settled in the neighbourhood of Montpellier, where Sir Samuel purchased a large estate.

The mode in which George Bentham was attracted to the botanical studies, which became the occupation of his life, is noteworthy. For it was through the applicability to them of logical methods which he had imbibed from his uncle's writings, and not from any special attraction to natural history pursuits. While studying at Angoulême, a copy of de Candolle's *Flore Française* fell into his hands and he was struck with the analytical tables for identifying plants. He immediately proceeded to test their use on the first that presented itself. The result was successful and he continued to apply it to every plant he came across. A visit to London in 1823 brought him into contact with the brilliant circle of English botanists. In 1826, at the pressing invitation of his uncle, he agreed to act as his secretary, at the same time entering at Lincoln's Inn and reading for the Bar. He was called in due time, and in 1832 held his first and last brief. The same year Jeremy Bentham died, leaving his property to his nephew. His father's inheritance had fallen to him the previous year. He was now in a position of modest independence, and able to pursue undistractedly his favourite studies. For a time these were divided between botany, jurisprudence, and logic, in addition to editing his father's professional papers. Bentham's first publication was his *Catalogue des Plantes Indigènes des Pyrénées et du Bas Languedoc* (Paris, 1826), the result of a careful exploration of the Pyrenees in company with Dr Walker Arnott (afterwards professor of Botany in the University of Glasgow). It is interesting to notice that in it Bentham adopted the principle from which he never deviated, of citing nothing at second-hand, or any fact or reference which he had not himself independently verified. This was followed by articles on various legal subjects: on codification, in which he disagreed with his uncle, on the laws affecting larceny, and on the law of real property. But the most remarkable production of this period was the *Outline of a New System of Logic, with a Critical Examination of Dr Whately's Elements of Logic* (1827). In this the principle of the quantification of the predicate was first explicitly stated. This Stanley Jevons declared to be "undoubtedly the most fruitful discovery made in abstract logical science since the time of Aristotle." Before sixty copies had been sold the publisher became bankrupt and the stock went for waste-paper. The book passed into oblivion, and it was not till 1873 that Bentham's claims to priority were finally vindicated against those of Sir William Hamilton by Herbert Spencer. In 1836 he published his *Labiatarum genera et species*. In preparing this work he visited, between 1830-34, every European herbarium, several more than once. The following winter was passed in Vienna, where he produced his *Commentationes de Leguminosarum generibus*, published in the annals of the Vienna Museum. In

1842 he removed to Pontrilas in Herefordshire. His chief occupation for some succeeding years was his contributions to the *Prodromus Systematis Naturalis Regni Vegetabilis*, which was being carried on by his friend, Alphonse de Candolle. In all these dealt with some 4730 species.

In 1854 he found the maintenance of a herbarium and library too great a tax on his means. He therefore offered them to the Government on the understanding that they should form the foundation of such necessary aids to research in the Royal Botanic Gardens at Kew. At the same time he contemplated the abandonment of botanical work. Fortunately, he yielded to the persuasion of Sir William Hooker, Lindley, and other scientific friends. In 1855 he took up his residence in London, and worked at Kew for five days a week, with a brief summer holiday, from this time onwards till the end of his life. As his friend Asa Gray wrote: "With such methodical habits, with freedom from professional or administrative functions, which consume the time of most botanists, with steady devotion to his chosen work, and with nearly all authentic material and needful appliances at hand, or within reach, it is not so surprising that he should have undertaken and have so well accomplished such a vast amount of work, and he has the crowning merit and happy fortune of having completed all that he undertook." The Government, in 1857, sanctioned a scheme for the preparation of a series of Floras, or descriptions in the English language of the indigenous plants of British colonies and possessions. Bentham began with the *Flora Hongkongensis* in 1861, which was the first comprehensive work on any part of the little-known flora of China. This was followed by the *Flora Australiensis*, in seven volumes (1863-78), the first flora of any large continental area that had ever been finished. His greatest work was the *Genera Plantarum*, commenced in 1862, and concluded in 1883 in collaboration with Sir Joseph Hooker, "the greater portion being," as Sir Joseph Hooker tells us, "the product of Bentham's indefatigable industry." As age gradually impaired his bodily powers, he seemed at last only to live for the completion of this monumental work. When the last revise of the last sheet was returned to the printer, the stimulus was withdrawn: his powers seemed suddenly to fail him. He commenced a brief autobiography. The pen with which he had written his two greatest works broke in his hand in the middle of a page. He accepted the omen, laid aside the unfinished manuscript, and patiently awaited the not distant end. He died on the 10th September 1884, within a fortnight of his 84th birthday.

The scientific world has received the *Genera Plantarum* with as unanimous an assent as was accorded to the *Species Plantarum* of Linnæus. Bentham possessed, as Professor Oliver has remarked, "an insight of so special a character as to deserve the name of genius, into the relative value of characters for practical systematic work, and as a consequence of this, a sure sifting of essentials from non-essentials in each respective grade." His preparation for his crowning work had been practically life-long. There are few parts of the world upon the botany of which he had not touched. In the sequence and arrangement of the great families of flowering plants, different views from those of Bentham may be adopted. But Bentham paved the way by an intimate and exact statement of the structural facts and their accurate relationship, which is not likely to be improved. In method and style, in descriptive work, Bentham was a supreme master. This, to quote Professor Oliver again, is "manifest not only in its terseness, aptness, and precision, but especially in the judicious selection of diagnostic marks, and in the instinctive estimate of probable range in variation, which long experience and innate genius for such work could alone inspire." (W. T. T.-D.)

Benton Harbor, a city of Berrien county, Michigan, U.S.A., situated in the southern part of the lower peninsula, on St Joseph river and on Lake Michigan, at an altitude of 596 feet. The city has three railways and a large lake commerce. Population (1900), 6562.

Benue, R. See NIGER.

Berar, or the BERARS, the familiar name of a province in Central India, officially styled the Haidarabad Assigned Districts. It is administered on the lines of a British province by a commissioner, who is subordinate to the resident at Haidarabad. The ancient capital was Ellichpur; the administrative headquarters are now at Amraoti, while Akola is the residence of the judicial commissioner. The six districts of Berar are—Amraoti, Akola, Ellichpur, Buldana, Wun, Basim. Its area covers 17,718 square miles. The population in 1891 was 2,897,486; the average density being 164 persons per square mile, ranging from 238 in the fertile plain of Amraoti to 120 in Wun, and only 29 in the hilly tract of Ellichpur. Classified according to religion, Hindus numbered 2,531,791, or 87 per cent. of the total population; Mahommedans, 207,681, or 7 per cent.; aboriginal tribes, 137,108, or 5 per cent., chiefly in the two hilly districts of Wun and Ellichpur; Christians, 1359, of whom 330 were Europeans and 318 Eurasians, leaving 711 for native converts, chiefly in Amraoti and Akola; Jains, 18,952; Parsees, 412; Sikhs, 177; and "others," 6. In 1901 the population was 2,752,418, showing a decrease of 5 per cent., compared with an increase of 8 per cent. in the preceding decade. Excluding the hilly tract in Ellichpur known as the Melghat, which has never been surveyed for revenue, it is estimated that only 2 per cent. of the total area available for cultivation remains unoccupied. The incidence of land revenue is nearly R.1 per acre. In 1897-98, out of a total cultivated area of 6,625,806 acres, only 18,078 were twice cropped. The irrigated area was 80,981 acres, almost entirely from wells, and mainly in the district of Buldana. The two staple crops of Berar are millet and cotton, each of which is ordinarily grown on about one-third of the cultivated area. Next in importance come wheat, oil-seeds, and pulse. In 1897-98, the area under cotton was 2,150,709 acres. The exports of cotton to Bombay average about 326,000 bales of 392 lb, valued at Rs.3,00,00,000 (say £2,000,000 sterling). In 1897 there were altogether 79 cotton factories under inspection. The daily number of operatives employed was 7547. The cotton mill at Badnera has 219 looms and 15,976 spindles, and employs 1186 hands, of whom 677 are adult males. In 1898 the output was 5796 bales of twist and yarn equal to 2,298,767 lb, and 2339 bales of cloth. There are also three oil-mills worked by steam, of which two at Amraoti in 1898 produced 236,150 gallons of oil and 2181 tons of oil-cake. Coal exists, but no mines are worked. Berar is traversed by the Nagpur line of the Great Indian Peninsula railway. The average imports and exports by rail, for the quinquennial period ending 1897, were valued at—imports, Rs.1,87,08,000, and exports (mainly raw cotton) Rs.3,97,56,000. The results of the famine were shown in 1897-98 by a reduction of one-half in the export of grain and oil-seeds, while the export of hides and the import of grain doubled. The export of raw cotton was little affected; but this almost entirely ceased in the still more disastrous year 1899-1900. In 1897-98 the total provincial revenue of Berar amounted to Rs.99,23,458, of which Rs.68,55,550 was derived from land, Rs.10,63,058 from excise, Rs.8,27,641 from stamps, and Rs.4,00,350 from forests. The total provincial expenditure amounted to Rs.1,00,47,081, of which Rs.43,91,423 was devoted to defraying the cost of the Haidarabad Contingent,

Rs.43,65,180 to the civil departments, Rs.7,16,137 to public works, and Rs.3,66,816 to famine relief. There was consequently a deficit; and for the first time for more than twenty years nothing could be paid over to the Nizam. In 1897-98 the local revenue amounted to Rs.8,55,967, and the local expenditure amounted to Rs.9,64,676. The municipalities in Berar number 12, with an aggregate population of 170,912. There are 6 district boards, with 21 subordinate *taluk* boards. In 1897-98 the aggregate income of the district boards was Rs.7,14,030, the aggregate expenditure was Rs.6,66,006. The following table gives the chief statistics of education in Berar for the years 1886-87 and 1896-97:—

	1886-87.		1896-97.	
	Schools.	Pupils.	Schools.	Pupils.
Secondary Schools . . .	26	4,695	28	3,992
Primary Schools . . .	935	38,530	1824	50,085
Special Schools . . .	1	96	4	109
Private Institutions . . .	26	340	5	157
Total . . .	988	43,661	1861	54,343

Compared with the estimated population of school-going age, the proportion of boys at school rose in ten years from 20·4 to 22·6 per cent.; while the proportion of girls at school has risen from ·7 to 1·8 per cent. The expenditure on education in 1886-87 was Rs.4,20,574, and in 1896-97 Rs.4,54,962. Berar suffered from famine in 1896-97, and again in 1899-1900. In June 1900 the maximum number of persons in receipt of relief was 516,000, or 18 per cent. of the total population. (J. s. co.)

Berat, chief town of the sanjak to which it gives its name, forming part of the vilayet of Janina, South Albania, Turkey in Europe. The population numbers 12,000, consisting wholly of Albanians, of whom about half are Orthodox Christians, and the remainder Mahommedans.

Beraun (Czech, *Beroun*), an old manufacturing town in the government-district of Horowitz in Bohemia, Austria, south-west of Prague, at the confluence of the Beraun with the Litawa river. It is the seat of important textile industry, sugar-refining, corn-milling, and brewing. Lime-kilns and the manufacture of cement, and smelting and iron works are carried on in the environs. In 1890 it had 7265 Czech inhabitants; in 1900, 9693.

Berbers.—The mingled aboriginal white races of the North African coast—hence known as Barbary—are now chiefly confined to the highlands, where they still maintain their own unwritten language, split up into many dialects, although for nearly a thousand years they have professed Islām. Ethnologists are not agreed as to the division in which to class either their stock or their language, which latter approximates to the Hamitic group in its vocabulary, but to the Semitic in its construction; and until, in recent years, French students made known the peculiarities of the Algerian section, very little had been ascertained regarding them, except that under the Carthaginian generals they were the valiant foes of Rome, and under Arab generals the conquerors of Spain. In Morocco they still maintain a semi-independence. Among themselves they are known as Imazighan, "Free-men" (s. Amazigh), and by various local names, but by the Moors as Bráber (s. Berber). Whether the Greeks, and through them the Romans, borrowed this name from the natives and applied it to other tribes of uncouth tongue, or whether the natives learned it from the foreigners, is a disputed point. (B. M. *)

Berchem, a town of Belgium, in the province and 2 miles south of the town of Antwerp, of which it is a

suburb. Its railway station is on the line between Antwerp and Brussels. Population (1880), 9384; (1897), 19,696.

Berck-sur-Mer, a seaside resort in the arrondissement of Montreuil, department of Pas-de-Calais, France, 53 miles in direct line W. by N. of Arras, with stations on branch line of railway from Abbeville to Boulogne. It comprises two parts, Berck-ville and Berck-plage. The latter has a fine sandy beach. There are large children's hospitals, the climate proving peculiarly beneficial in the treatment of scrofulous affections. About 100 boats are employed in the fisheries, and herrings form the staple of an active trade. Fishing boats are built. Population (1881), 3999; (1896), 5787.

Beregszász, a corporate town of Hungary, capital of the county of Bereg, 57 miles E. by N. of Tokay. Saxons were the original settlers in the 13th century; now almost the entire population (9629) is Magyar. There are administrative and other offices; also a state gymnasium.

Berezovskiy Zavod, a wealthy village of east Russia, on the eastern slope of the Urals, on Pyshma river, 8 miles north-east of Ekaterinburg. It is one of the largest settlements of the government of Perm and the centre of an important mining region of the same name, where gold is extracted from quartz veins. The crushing of the quartz used to be made at Berezovskiy Zavod, but is now done at other works as well. The population, which was 10,189 in 1885, has decreased since, and has chiefly taken to the manufacture of boots, stone-cutting, and cabinet-making.

Berga, a town of Spain, in the province of Barcelona, on a spur of the Pyrenees, on the right bank of the river Llobregat. It is partly built on rising ground, and partly on the level plain. It has a theatre, casinos, and a fine parish church with three naves. Here was established the first cotton industry of Catalonia, and the house of Targneil invented the "bergadanás" weaving machinery long used in the province. In the neighbourhood there are lignite beds of importance, and barley, oats, corn, and maize are grown in the hills around Berga. It is supposed to be the *Castrum Bergium* of Livy. It was taken and retaken often in the 17th and 18th centuries by the French and Spaniards, and by Liberals and Carlists in the 19th. Population, 5239.

Bergamo, chief town of the province of Bergamo, Lombardy, Italy. A large public slaughter-house, a cattle market, and a provincial asylum for 700 inmates (costing £60,000), have been built, electric tramways and lighting have been introduced, and a funicular railway has been constructed between the modern town and the ancient city on the hill. Several new streets have been opened and works erected to protect the town against torrents from the surrounding heights. The municipal library has, since 1875, been enriched by bequests from Donizetti, Meyer, Spaventa, and Ravelli, and now possesses 160,000 volumes. The Fine Arts Academy, founded in 1797 by Count Giacomo Carrara, has likewise been enriched by legacies. The cathedral has been restored and completed, the ancient baptistery reconstructed by the side of the Colleoni chapel, and the house of the famous Condottiero Colleoni restored. Monuments have been erected to Victor Emmanuel II., Garibaldi, and the musicians Donizetti and Meyer, natives of Bergamo. The elementary schools give instruction to nearly 3000 children. Direct railway communication now exists with Milan, Cremona, Lecco, Monza, Brescia, Venice, Novara, and Turin. Steam tram lines also connect it with Treviglio, Lodi, and Monza. The mining industry (iron, copper, and marble) has been greatly developed since 1875. The commune of Gandino in the province of Bergamo is a centre of woollen industry, while

at Fara d'Adda are the largest linen and woollen mills in Italy. Twelve cotton-spinning works have recently been established. The silk industry has maintained its importance in the province, while in the city printing and lithography have especially advanced. Various artificial manure factories supply the demands of agriculture. The cattle markets dispose annually of 50,000 cattle, 12,000 horses, 10,000 sheep, and 60,000 swine, for a total value of £640,000. The city *octroi* in 1899 amounted to £30,000. Population of town (1881) 39,704, (1901) 45,785; of province (1881) 390,775, (1901) 457,983. (L. BL.)

Bergedorf, a town of Germany, in the territory of Hamburg, 10 miles by rail E. by S. from the city. It produces vegetables and fruit for the Hamburg markets, and carries on tanning, glass manufacture, brewing, and brick-making. It received town rights in 1275, belonged to Lübeck and Hamburg conjointly from 1420 to 1867, and in the latter year was bought by Hamburg. Population (1885), 5209; (1895), 8297; (1900), 10,250.

Bergen, a seaport, fortress, and bishop's see of Norway, forming a separate county (*amt*) by itself, on the W. coast, in 60° 23' N. lat., and 5° 18' E. long. The new buildings include St John's church (1893), the Exhibition Building (containing fisheries museum, &c.), an observatory, a fine exchange, a biological station, and an aquarium. Both Ibsen and Björnson were connected with the theatre. Bergen is the birthplace of the poets Holberg (1684-1754) and Welhaven (1807-1873), of Dahl, the painter (1788-1857), of Ole Bull, the violinist (1810-1880), and of Grieg, the composer. There are statues to Holberg (1884) and Christie, president of the Storting in 1815-16 and 1818. The mercantile fleet in 1899 numbered some 370 vessels, with an aggregate of 541,200 tons, as compared with 350 vessels of 370,600 tons owned by Christiania in the same year, Bergen's preponderance being due to her larger number of iron steamships. In 1879 Bergen ranked after Christiania, Arendal, Stavanger, and Drammen; in 1900 she ranked first. The trade of the town grew from a total of £2,346,700 (imports £1,475,700, exports £871,000) in 1879 to £3,595,600 (imports £2,223,000, exports £1,372,600) in 1897. The staple of the trade is fish—codfish, herrings, cod-liver oil, and other fish products, anchovies, lobsters, &c. The other exports of chief importance are butter, copper ore, and hides. The imports consist principally of coal (125,000 to 190,000 tons annually), steamships, salt, cereals and flour, groceries, wines and spirits. The port was entered and cleared by a total of 690,200 tons in 1898. Bergen is not a great manufacturing city. Its chief industries are connected with the preparation of fish products and with shipbuilding; but there are also cotton and woollen weaving, with manufacture of paper, glass, earthenware, tobacco, cordage, and distilleries. Bergen is connected by rail with Vossevangen in the interior, a distance of 67 miles. In 1896 a beginning was made with the continuance of this line through the fjelds (fells) to connect with Christiania. In the first 50 miles from Vossevangen the line ascends 4080 feet, passing through a tunnel 5796 yards long at an altitude of 2822 feet; the tunnel is to be completed in July 1902. Population (1875), 38,573; (1891), 53,684; (1899), 68,393. (J. T. BL.)

Bergen-op-Zoom, a town in the province of North Brabant, Holland, about 15 miles north of Antwerp, on the Roosendaal-Flushing railway. Beetroot is cultivated, and a trade is carried on in oysters as well as anchovies. A steam tramway to Antwerp, of recent construction, has given a great impetus to the export trade in fish. The population in 1899 was 13,668.

Bergerac, chief town of arrondissement, department of Dordogne, France, 19 miles S.S.W. of Périgueux, at the intersection of the railways from Libourne to Buisson, and Angoulême to Marmands. Extensive trade is maintained in truffles, grain, and chestnuts, considerable quantities of the last being sent to England. There are fine nurseries, and an important salmon fishery at the Salvette reservoir. Population (1881), 10,022; (1896), 10,697; comm. 13,594; (1900), 15,982.

Berhampore, the name of two towns in British India, in Bengal and Madras. (1) The headquarters of Murshidabad district, in Bengal, is situated on the left bank of the river Bhagirathi, 5 miles below Murshidabad city. Population, about 25,500. Berhampore was fixed upon after the battle of Plassey as the site of the chief military station for Bengal; and a huge square of brick barracks was erected in 1767, at a cost of £300,000. Here was committed the first overt act of the mutiny, on 25th February 1857. No troops are now stationed here, and the barracks have been utilized for a jail, a lunatic asylum, and other civil buildings. The old cemetery contains many interesting tombs, including those of Warren Hastings' first wife, the Irish adventurer George Thomas, and the hero of Mrs Sherwood's tale, *Little Henry and his Bearer*. A college, founded by Government in 1853, was made over in 1888 to a local committee, being mainly supported by the munificence of the late Rani Svarnamayi. (2) The headquarters of Ganjam district, in Madras, is situated in 19° 18' N. lat. and 84° 48' E. long., about 9 miles from the sea-coast. It is a station on the East Coast railway, which connects Calcutta with Madras. Population, about 25,500. Berhampore has a military cantonment, containing a wing of a native regiment, sometimes distinguished as Baupur. There is some weaving of silk cloth, and export trade in sugar. There are two churches and four printing-presses. The college, originally founded by Government, is now maintained by the Raja of Kallikota.

Beri-beri.—Beri-beri is described as a specific form of multiple peripheral neuritis, endemic in certain latitudes, and liable to epidemic diffusion. (For peripheral neuritis, see *PATHOLOGY, Neuropathology*.) According to Dr Manson, it is a disease of the greatest antiquity, and known to the Chinese from an extremely remote period. At one time its importance as a tropical disease was generally recognized, but it gradually dropped out of sight and was forgotten, until an epidemic in Brazil in 1863, and the opening up of Japan, where it prevails extensively under another name, brought it again into notice. The recognition of its character as essentially a form of peripheral neuritis is quite recent, and due to the researches of Scheube and Bály in Japan, and of Pekelharing and Winkler in the Dutch Indies. The geographical distribution of beri-beri is between 45° N. and 35° S. It occurs in Japan, Korea, and on the Chinese coast south of Shanghai; in Manila, Tongking, Cochin China, Burma, Singapore, Malacca, Java, and the neighbouring islands; also in Ceylon, Mauritius, Madagascar, and the east coast of Africa. In the Western hemisphere it is found in Cuba, Panama, Venezuela, and South America. This distribution is curious and unintelligible as it stands. Probably further investigation will show that the disease is much more widely distributed. It has been carried in ships to Australia and to England. Dr Manson has "known it originate in the port of London in the crews of ships which had been in harbour for several months," and he suggests that when peripheral neuritis occurs in epidemic form it is probably beri-beri.

The cause is believed by many authorities to be an infective agent of a parasitic nature, but attempts to identify

it have not hitherto been successful. It is "not obviously communicable from person to person" (Manson), but may be carried from place to place. It clings to particular localities, buildings, and ships, in which it has a great tendency to occur; for instance, it is apt to break out again and again on certain vessels trading to the East. It haunts low-lying districts along the coast, and the banks of rivers. Moisture and high temperature are required to develop its activity, which is further favoured by bad ventilation, overcrowding, and underfeeding. Some writers have suggested that it is allied to malaria, but it has not the same geographical distribution, and the symptoms are entirely different. The absence of fever seems to exclude the theory of a micro-parasite. Another hypothesis is that it is caused by unwholesome diet. The experience of the Japanese navy points strongly in this direction. Beri-beri was constantly prevalent among the sailors until 1884, when the dietary was changed. A striking and progressive diminution at once set in, and continued until the disease wholly disappeared. Major Ronald Ross has suggested that beri-beri is really arsenical poisoning. Many facts about it support the idea that it is some form of chronic poisoning, but at present there is nothing pointing to arsenic. One would rather expect it to be some fungoid growth affecting grain, such as rice or maize, or some other food-stuff commonly used in the localities where beri-beri is prevalent, and among sailors. The conditions under which their food is kept on board certain ships might explain the tendency of the disease to haunt particular vessels.

The most susceptible age is from 15 to 40. Children under 15 and persons over 50 or 60 are rarely attacked. Men are more liable than women. Race has no influence. Previous attacks powerfully predispose.

The symptoms are mainly those of peripheral neuritis with special implication of the phrenic and pneumo-gastric nerves. There is usually a premonitory stage, in which the patient is languid, easily tired, depressed, and complains of numbness, stiffness, and cramps in the legs; the ankles are cedematous and the face is puffy. After this, pronounced symptoms set in rapidly, the patient suddenly loses power in the legs and is hardly able to walk or stand; this paresis is accompanied by partial anæsthesia, and by burning or tingling sensations in the feet, legs, and arms; the finger-tips are numb, the calf muscles tender. These symptoms increase; the oedema becomes general, the paralysis more marked; breathlessness and palpitation come on in paroxysms; the urine is greatly diminished. There is no fever, unless it is of an incidental character, and no brain symptoms arise. The patient may remain in this condition for several days or weeks, when the symptoms begin to subside. On the disappearance of the oedema the muscles of the leg are found to be atrophied. Recovery is very slow, but appears to be certain when once begun. When death occurs it is usually from syncope through over-distension of the heart. The mortality varies greatly, from 2 to 50 per cent. of the cases. The disease is said to be extremely fatal among the Malays. After death there is found to be serous infiltration into all the tissues, and often hæmorrhages into the muscles and nerves, but the most important lesion is degeneration of the peripheral nerves. The cerebro-spinal centres are not affected, and the degeneration of the nerve-fibres is more marked the farther they are from the point of origin. The implication of the phrenic and pneumo-gastric nerves, and of the cardiac plexus, accounts for the breathlessness, palpitation, and heart failure; that of the vaso-motor system for the oedema and diminution of urine, and that of the spinal nerves for the loss of power, the impairment and perversion of sensation. According as these nerves are

variously affected, the symptoms will be modified, some being more prominent in one case and some in another.

There is no specific treatment for beri-beri. The most important measure is the removal of patients from the locality. If this is done they generally recover spontaneously, which again is in keeping with the theory of chronic poisoning. Symptoms may be treated as they arise. For prevention it is advisable to move other people from the same locality, or withdraw them from the operation of the same influence whatever it may be.

SIR PATRICK MANSON. *Tropical Diseases*, new ed., 1900. A full bibliography is given by Dr Manson in Allbutt's *System of Medicine*. (A. SL.)

Berislav, or BORISLAV, a town of south-west Russia, government and 46 miles N.E. of Kherson, situated on the left bank of the Dnieper. It is supposed to have been founded in 1450 by the Turks. It contains steam flour-mills. The population is 12,081.

Berja, a town of Spain, province of Almeria, in a valley to the east of the Rio Grande. The country around Berja is mostly mountainous, and produces in a few valleys cereals, wine, oil, oranges, esparto grass, and fruits. Lead mines are in the district, and paper, cotton goods, and linen are manufactured in the town. Population (1897), 12,116.

Berkeley, a city of Alameda county, California, U.S.A., situated in 37° 52' N. lat., and 122° 16' W. long., on the east shore of San Francisco Bay, adjoining Oakland on the north and opposite San Francisco. It is traversed by two branches of the Southern Pacific railway. It is the site of the University of California, founded in 1868, one of the largest and most prosperous educational institutions in the state. It is richly endowed, having property valued at \$8,000,000 and an income exceeding \$500,000. Besides the literary, scientific, and engineering departments, which are at Berkeley, it has law, medical, and other departments in San Francisco, and an astronomical observatory (Lick) on Mount Hamilton near San José. Its professors and instructors in all departments in 1900 numbered 483, and its students 3024, about 40 per cent. of whom were women. Population (1890), 5101; (1900), 13,214.

Berkeley Fort. See NILE.

Berkeley, Miles Joseph (1803-1889), British botanist, was born in 1803 at Biggin, Derbyshire, and educated at Rugby and Christ Church, Oxford. He took holy orders, and was curate at Margate and Market Harborough, afterwards being vicar of Sibbertoft. An English country clergyman of good family, he had acquired so enthusiastic a love of cryptogamic botany in his early years that he soon became well known as the leading British authority on Fungi and plant pathology, a position he maintained till very late in life. Berkeley was especially famous as a systematist in mycology, some 6000 species of Fungi being credited to him, but it would be an error to regard him as merely a specialist in this direction. His *Introduction to Cryptogamic Botany*, published in 1857, and his papers on "Vegetable Pathology" in the *Gardener's Chronicle* in 1854 and onwards, show that he had a very broad grasp of the whole domain of physiology and morphology as understood in those days. Moreover, it should be pointed out that Berkeley commenced his work as a field naturalist and collector, his earliest objects of study having been the Mollusca and other branches of zoology, as testified by his papers in the *Zoological Journal* and the *Magazine of Natural History*, between 1828 and 1836. As a microscopist he was an assiduous and accurate worker, as is shown by his numerous drawings of the smaller Algæ and Fungi, and by the admir-

able dissections of Mosses and Hepatics which he contributed; his investigations into the potato murrain, caused by *Phytophthora infestans*, and the grape mildew, to which he gave the name *Oidium Tuckeri*, and the pathogenic Fungi of wheat rust, hop mildew, and various diseases of cabbage, pears, coffee, onions, tomatoes, &c., were important in results on the life-history of these pests, at a time when very little was known of such matters, and must always be considered in any historical account of the remarkable advances in the biology of these organisms which were made between 1850 and 1880; and when it is remembered that this work was done without any of the modern appliances or training of a properly equipped laboratory, the significance of Berkeley's genius as a pioneer gains considerably in importance. It is as the founder of British mycology, however, that Berkeley's name will live in the history of botany, and his most important work is contained in the account of native British Fungi in Sir W. Hooker's *British Flora* (1836), the *Introduction to Cryptogamic Botany* (1857), and in his *Outlines of British Fungology* (1860), together with his magnificent herbarium of over 9000 species now at Kew. This collection is enriched by numerous notes and sketches, and forms one of the most important type series in the world. Berkeley's writings abound in evidence of his appreciation of the labours of others, whether as collaborators with himself as a collector, as were Broome in England and Curtis in America, or as workers in foreign countries with whom he had corresponded or whose works he had studied, as in the case of the Tulasnes, de Bary, Pringsheim, Fries, and other Continental workers engaged, like himself, in laying the foundations of modern cryptogamic botany. Berkeley died in July 1889. He was a man of refined and courteous bearing, an accomplished classical student, with the simple and modest habits that befit a man of true learning. A list of his publications will be found in the *Catalogue of Scientific Papers* of the Royal Society, and sketches of his life in *Proc. R. S.* vol. xlvii., 1890, p. 9, by Sir Joseph Hooker, and *Annals of Botany*, vol. xi., 1897, by Sir W. T. Thiselton-Dyer. (H. M. W.)

Berkhamstead, Great, a market town and railway station, in the Watford parliamentary division of Hertfordshire, England, 26 miles N.W. of London. The grammar school has been extended, and a high school for girls, on the same foundation, established. The sewerage is improved. A large chemical factory has been established. Area of ancient parish, of which the present parish and urban district is only part (since 1898), 4364 acres; population (1881), 4485; (1891), 5034; (1901), 5219.

Berkshire, a south-eastern county of England, bounded N. and N.E. by the Thames, S.E. by Surrey, S. by Hampshire, and W. by Wilts.

Area and Population.—The area of the ancient county is 462,224 acres, or 722 square miles, with a population in 1881 of 218,363, and in 1891 of 238,709, of whom 117,208 were males and 121,501 females, the number of persons per square mile being 331 and of acres to a person 1.91. In 1901 the preliminary census report gave the population as 254,931. The area of the administrative county, as given in the census returns of 1891, was 461,742 acres, with a population of 236,163; in 1901 (including the county borough of Reading), a population of 252,580. But a slight alteration in the area was made in 1895, by the transference to Berks of the part of the parish of Hungerford in Wilts, and of the parish of Combe in Hampshire, and by the transference to Wilts of part of the parish of Shalbourne in Berks. The registration county comprises 574,298 acres, with a population in 1891 of 268,357, of whom 111,543 were urban and 156,814 rural. Within the registration area the increase of population between 1881 and 1891 was 9.60 per cent. The excess of births over deaths between 1881 and 1891 was 34,690, but the increase in the resident population was only 20,727. The following table gives the numbers of marriages, births, and deaths, with the number of illegitimate births for 1880, 1890, and 1898:—

Year.	Marriages.	Births.	Deaths.	Illegitimate Births.	
				Males.	Females.
1880	1597	7771	4464	191	189
1890	1729	7174	4218	180	152
1898	1935	7031	4210	181	170

The number of marriages in 1899 was 2026, of births 6913, and of deaths 4288.

The marriage-, birth-, and death-rates were all below the average for England, as is also the percentage of illegitimate births. The following table gives the rates to 1000 persons living for a series of years, with the percentage of illegitimate births:—

	1870-79.	1880.	1880-89.	1890.	1888-97.	1898.
Marriage-rate	13·8	12·9	12·6	13·0	13·2	13·7
Birth-rate	31·9	31·5	30·2	26·9	26·8	24·8
Death-rate	18·5	18·1	16·4	15·8	15·2	14·9
Percentage of illegitimacy	5·2	4·8	4·8	4·6	4·6	5·0

In 1891 there were in the county 1430 natives of Scotland, 1422 natives of Ireland, and 596 foreigners.

Constitution and Government.—Berks is divided into three parliamentary divisions, and it also contains the parliamentary borough of Reading and parts of the boroughs of New Windsor and Oxford. There are seven municipal boroughs, Abingdon (6480), Maidenhead (12,980), Newbury (11,061), New Windsor (13,958), Reading (72,214), Wallingford (2803), and Wokingham (3254). Reading is now a county borough. The only urban district is Wantage (3766). The county is in the Oxford circuit, and assizes are held at Reading. The boroughs of Abingdon, Maidenhead, Newbury, New Windsor, Reading, and Wallingford have separate commissions of the peace, and Abingdon, Newbury, New Windsor, and Reading have, in addition, separate courts of quarter sessions. The ancient county is in the diocese of Oxford, and contains 190 ecclesiastical parishes or districts and parts of ten others.

Education.—The number of elementary schools on 31st August 1899 was 249, of which only 23 were board and 226 were voluntary schools, the latter including 201 Church of England schools, 7 Wesleyans, 4 Roman Catholic, and 14 "British and other." The average attendance at voluntary schools was 30,740, and at board schools 7959. The total school board receipts for the year ending 29th September 1899 were £47,481. The income under the Agricultural Rates Act was over £285.

Agriculture.—Much attention is paid to dairy farming, butter and cheese being largely made, and also condensed milk. Sheep are also largely reared, and an excellent breed of pigs is peculiar to the county. About seven-ninths of the total area is under cultivation, and of this about five-ninths is in permanent pasture. Only about 2000 acres are in hill pasture, while over 35,000 acres are under woods, and about 2700 acres under orchards, apples and cherries being largely grown. Although diminishing, the acreage under wheat still amounts to about two-fifths of that under corn crops, the other principal corn crops being oats and barley. Of the green crops turnips occupy much the larger acreage—about one half of the whole, the acreage under potatoes being inconsiderable. The following table gives the acreages of the larger main divisions of the cultivated area at intervals of five years from 1880:—

Year.	Total Area under Cultivation.	Corn Crops.	Green Crops.	Clover.	Permanent Pasture.	Fallow.
1880	375,890	138,462	54,910	41,993	123,918	16,591
1885	377,321	131,100	56,079	43,839	136,004	10,283
1890	376,368	123,745	49,681	42,114	151,984	8,681
1895	367,983	105,101	43,865	41,837	163,520	13,086
1900	364,431	104,512	41,265	41,953	169,304	6,981

The following table gives particulars regarding the principal live stock at the same date:—

Year.	Total Horses.	Total Cattle.	Cows or Heifers in Milk or in Calf.	Sheep.	Pigs.
1880	15,292	35,274	16,414	259,572	28,931
1885	16,055	45,713	19,971	266,546	36,489
1890	15,397	43,461	20,292	231,322	35,371
1895	15,517	39,154	19,052	184,668	33,197
1900	14,717	45,161	21,348	184,797	22,130

Industries and Trade.—According to the report for 1898 of the chief inspector of factories (1900), the total number of persons employed in non-textile factories and workshops in 1897 was 16,006, as compared with 14,794 in 1896. There were no textile factories. The

number employed in non-textile factories was 12,110, the increase between 1895 and 1896 being 7·3 per cent, while between 1896 and 1897 it was 6·1 per cent. No fewer than 5364 were employed in the food industry, a large number in the biscuit works at Reading. Over 2000 persons are employed in factories and workshops in the manufacture of machines, appliances, &c., chiefly in iron foundries and engineering works. Boat-building also gives employment to a good many persons. The clothing trade has been revived at Abingdon, the total number of persons employed in workshops in this industry being 1735. There are extensive seed warehouses at Reading, and the Kennet and Windsor ales retain their repute. Whiting is manufactured from chalk at Kintbury. Of clay 110,953 tons were raised in 1899.

AUTHORITIES.—Chief of the older works is: ELIAS ASHMOLE. *Antiquities of Berkshire*, 3 vols., 1719; 2nd ed. London, 1723; 3rd ed. Reading, 1736. Other works are: MARSHALL. *Topographical and Statistical Details of the County of Berkshire*, London, 1830.—EARL OF CAERNARVON. *Archæology of Berkshire*, London, 1859.—KENNEDY. *Birds of Berkshire and Buckinghamshire*, Eton, 1868.—KING. *History of Berkshire* (popular County History series), London, 1887.—LOWSLEY. *Glossary of Berkshire Words*, London, 1888, and *Index to Wills in the Court of the Archdeacon of Berkshire*, 1508-1652, Oxford, 1893. See also *The Berks Archæological Society's Quarterly Journal*, and *Berkshire Notes and Queries*.

Bêrlad, a town in Rumania, chief town of the district of Tutova. There is a fine hospital under the administration of the St Spiridon hospital of Jassy. Bêrlad possesses several soap factories, and its horse fairs are well known throughout Rumania. In the vicinity are some traces of a Roman encampment. Population (1895), 23,000; (1900), 24,484—about one-fourth Jews.

Berlin, the capital of Prussia, and since 1871 the metropolis of the German empire, is situated on the river Spree in 52° 30' 17" N. lat. and 13° 23' 17" E. long., at a height of about 100 feet above the level of the Baltic. The mean temperature for the ten years 1889-98 was 48·2° Fahr., and the rainfall 22·4 inches. In a general way it may be said that the climate is exhilarating and healthful. The boundaries of the city have not been extended since 1861, and though large and important suburbs have crept up and have practically coalesced with it, the administrative area remains unchanged. It occupies 28 English square miles, with a length from E. to W. of 6, and a breadth from N. to S. of 5½ English miles, contains about 940 streets, 90 open places, and 90 bridges, and has a population (1900) of 1,857,000 inhabitants. If the immediate suburbs be reckoned, Greater Berlin has a population of no less than 2,430,000. Politically, the city is divided into six Reichstag and four Landtag parliamentary constituencies, returning six and nine members respectively, and it must be noted that, despite the enormous increase in population, there has not been in Prussia, in the case of the Landtag, any redistribution of seats since 1860, so that the city is, in proportion to its population, much under-represented. It should have twenty-three members instead of nine.

The oldest part of Berlin, the city and Altkölln, built along the different arms of the Spree, still remains the centre of business activity. The social and official life of the capital centres round Unter den Linden, which runs from the royal palace to the Brandenburger Thor. This street, nearly one English mile in length, and forming a double avenue, is the favourite promenade, and presents Berlin life in all its varying aspects. Many historical scenes have taken place in this famous boulevard, such as the entry of the troops in 1871, and the funeral pageant of the Emperor William I., and no other city in Europe possesses so stately a thoroughfare. Although it has been embellished by the addition of new buildings, notably hotels, restaurants, and cafés, its appearance has undergone no important change. South of Unter den Linden lies the Friedrichstadt, with its parallel lines of straight streets, comprising the Behrenstrasse, the seat of the *haute finance*, the Wilhelmstrasse (with the palace of

the Reichskanzler) the "official" quarter of the capital, and the long Friedrich and Leipziger Strassen, both of which are flanked by handsome and attractive shops and restaurants, among the latter being the "*bier* palaces" of the great breweries. It is beyond this quarter that great additions have been made. In 1870 Berlin was practically bounded on the south by the Landwehr canal, but it has since extended far beyond, and on this side is now only limited by the Tempelhofer Feld, the "*champ de Mars*" of the capital, where the famous military reviews are held. The Landwehr canal, leaving the Spree at the Schlesisches Thor and rejoining it at Charlottenburg, after a course of six miles, adds no little to the charm of the southern and western districts (the residential quarter of the city), being flanked by fine boulevards and crossed by many handsome bridges, notably the Potsdamer and Victoria Brücke, which carries the traffic from two converging streets into the outer Potsdamer Strasse and the Hercules Brücke, connecting the spacious Lützow Platz with the Thiergarten. To the north of the Unter den Linden lies the university quarter, with numerous hospitals and scientific institutions, which, interspersed with barracks and other military buildings, practically occupies the whole district lying between the Spree and the Oranien and Karl Strassen, the so-called Luisenstadt.

Berlin is the principal residence of the emperor, the seat of the Reichstag and the Prussian diets, and of the various State offices of the empire, the sole exception being the Supreme Court of Justice (*Reichsgericht*) which, despite the exertions of Prussia, remains fixed at Leipzig. Since 1871 the growth of the city and its economic progress have been phenomenal; indeed, it is only in Budapest that any parallel can be found among cities of the eastern hemisphere for such rapid expansion and development. Its population has more than doubled in the last three decades. While in 1871 it amounted to 826,341, in 1890 to 1,578,794, it had in 1900 reached a total (including a garrison of some 20,000 strong) of 1,857,000.

The marriage-rate (1898) was 22·09 per thousand, as against 21·92 for the preceding ten years; the birth-rate, for the same year, 28·93 per thousand, of which 4·58 were illegitimate, as against an average of 31·20 for the 10 years; the death-rate 18·25, a rate which has rapidly diminished, the average for the ten years ending 1898 being 21·00, the average for the whole century from 1798 being no less than 30 per thousand.

The situation of Berlin, so far from being prejudicial to its growth and prosperity, has been the greatest determining factor in its rapid rise to the position of the greatest industrial and commercial city on the Continent. The Spree with its deep-water channel, and rarely frost-bound, connects it on the east through canals with the Oder, and thus with Stettin and other Baltic ports, and with river navigation in upper Silesia, Poland, and upper Austria, while linking it on the west through the Havel lakes with Hamburg, and with the cities of the upper Elbe. In addition to its waterways, it is also the centre of an extensive railway system bringing it into close connexion with all the leading cities of the Continent.

For administrative purposes the city is divided into 48 wards, with 369 municipal and 102 police districts. After 1870 doubts were often expressed whether the capital would be able to bear the burden of empire, so enormous was the influx of citizens. It is due to the magnificent services of the municipal council that the city was enabled to assimilate the hosts of newcomers, and it is to its indefatigable exertions that Berlin has in point of organization become the model city of Europe. In none other has public money been expended with such enlightened discretion, and in none other has the municipal system kept pace with such rapid growth and displayed greater resource in emergencies. In 1870 the sanitary

conditions of Berlin were the worst of any city in Europe. It needed a Virchow to open the eyes of the municipality to the terrible waste of life such a state of things entailed. But open sewers, public pumps, cobble-paved roads, open market-places, and overcrowded subterranean dwellings are now things of the past. The city is excellently drained, well paved, well lighted, and furnished with an abundant supply of carefully filtered water, whilst the cellar dwellings have given place to light and airy tenements, and it justly claims to rank with the cleanest and healthiest capitals in Europe.

The immediate effect upon Berlin of the successful issue of the war of 1870 was electrical. The old Prussian capital girded itself at once to fulfil its new rôle. The concentration upon the city of a large garrison flushed with victory, and eager to emulate the vanquished foe in works of peace, and vie with them in luxury, was an incentive to Berliners to put forth all their energy. Besides the military, an enormous immigration of civilian officials took place as the result of the new conditions, and as accommodation was not readily available rents rose to an enormous figure. Building proceeded in hot haste, and in the years immediately following the war whole streets of tenement houses, for the most part badly arranged, ill built, and of no architectural pretensions, were hurriedly erected. The year 1878 marks a fresh starting-point in the development of the city. In that year Berlin was the meeting-place of the famous congress which bears its name. The recognition of Germany as a leading factor in the world's counsels had been given, and the people of Berlin could indulge in the task of embellishing the capital city of the empire in a manner befitting its position. From this time forward, State, municipal, and private enterprise have worked hand in hand to make the capital cosmopolitan. Since the last edition of this work was published Berlin has been enriched by many public buildings, and is able in this respect to vie in magnificence with any other capital in the world. Especially in the matter of churches a striking increase is noticeable. The city now contains 115 Christian places of worship: viz., 99 Evangelical, 15 Roman Catholic, and 1 Greek; and 9 Jewish synagogues, and of these no fewer than 30 have been dedicated during the reign of the Emperor William II. First and foremost among them is the new cathedral (*Dom*) which replaces the old building pulled down in 1893. It is an imposing edifice of sandstone in the style of the Italian Renaissance, and has a dome rising with the lantern to a height of 380 feet (see article ARCHITECTURE). The Kaiser Wilhelm Gedächtniss Kirche (in the suburb Charlottenburg) with a lofty spire, the Dankes Kirche (in commemoration of the Emperor William I.'s escape from the hand of the assassin Nobiling in 1878) in Wedding, and the Kaiser Friedrich Gedächtniss Kirche on a grassy knoll in the north of the Thiergarten, are worthy of especial notice. In the Montbijou Park, on the north bank of the Spree, and just behind the Royal Museum, has been built the very pretty little English church of St George. The establishment of the imperial Government in Berlin naturally brought with it the erection of a large number of public buildings, and the great prosperity of the country, as well as the enhanced national feeling, has enabled them to be built on a scale of splendour befitting the capital of an empire. First in importance is the Reichstagsgebäude, in which the Reichsrath (imperial council) and the Reichstag (imperial diet) hold their sittings. The building is described in the article on ARCHITECTURE; a special feature is the library, which is exceedingly rich in works on constitutional law. A new house has also been built for the Prussian parliament (*Landtag*) and the Prussian House

of Lords (Herrnhaus) in the Albrecht Strasse. Other new official buildings are the Patent Office on the site of the old Ministry of the Interior; the new Ministry of Posts (with Post Museum) at the corner of the Mauer and Leipziger Strassen; the Central Criminal court in Moabit; the courts of first instance on the Alexander Platz; the Ministry of Police, and the Reichsversicherungs-amt, which is the centre for the great system of old-age pensions. In addition to these, many buildings have been restored and enlarged, chief among them being the Zeughaus (Armoury), the War Office, and the ministry of public works, while the Marstall (Royal Mews) has been entirely rebuilt and boasts an imposing façade.

Among the public monuments comes first and foremost

the bronze equestrian statue of the Emperor William I. (by R. Begas), erected opposite the west portal of the Schloss. The space for the site was gained by pulling down the old houses composing the so-called Schlossfreiheit and damming back the Spree. The monument, which cost £200,000, represents the emperor in a martial cloak, his right hand resting on a field-marshal's baton, reining in his charger, which is led by a female genius of peace. The work is mounted on a high pedestal and is surrounded by a colonnade of Ionic columns. On the square on the south side of the castle is a bronze fountain (also by R. Begas) representing "Neptune on rocks," the gift of the city to the Emperor William II. On the Königsplatz, in the north-east corner of the Thier-

BERLIN (Environs).

garten, between the column of Victory and the Reichstagsgebäude, and immediately facing the western façade of the latter, is the bronze statue of Prince Bismarck, unveiled in April 1901, a figure 20 feet in height standing on a granite socket. From the south side of the Königsplatz runs the broad Sieges Allee, lately adorned by thirty-two groups of marble statuary representing famous rulers of the house of Hohenzollern, the gift of the Emperor William II. to the city. The Thiergarten itself, the beautiful park with its thickets of dense undergrowth and winding lanes and lakes, has lost somewhat of its sylvan character owing to building encroachments on the north side and the laying out of new rides and drives. It has in addition to those above enumerated been enriched by statues of Queen Louisa, of Goethe, and Lessing. The smaller parks around the city, as the Friedrichshain, Humboldtshain, and the Victoria park on the Kreuzberg, have not, except in the case of the last, which has received a waterfall, been materially altered.

Berlin is the centre of the North German network of railways. No fewer than twelve main lines concentrate upon it. Internal communication is provided for by

the Ringbahn, or outer circle, which was opened in 1871, and by a well-devised system connects the termini of the various main lines. The through traffic coming from east and west is carried by the so-called Stadtbahn, or city railway, which also connects with and forms an integral part of the outer circle. This line runs through the heart of the city, and was originally a private enterprise. Owing, however, to the failure of the company, the great work was taken in hand by the State, and the line opened in 1878. It has four tracks—two for the main-line through traffic, and two for local and suburban service, and is carried at a height of about 20 feet above the streets. Its length is 12 miles, the total cost 3½ millions sterling. The chief stations are Zoologischer Garten, Friedrich Strasse, Alexander Platz, and Schlesischer Bahnhof. Lying apart from the system are the Lehrter Bahnhof for Hamburg and Bremen, the Stettiner for Baltic ports, and the Görlitzer, Anhalter, and Potsdamer termini for traffic to the south, of which the last two are fine specimens of railway architecture. Internal communication is also provided for by an excellent system of tram-lines worked both by horses and by electricity, while

an overhead electric railway runs from the Zoologischer Garten to the Schlesisches Thor, with a branch from the Potsdamer Bahnhof terminating near the Friedrichstrasse Bahnhof.

Industry, Trade, and Commerce.—It is in respect of its manufacture and trade that Berlin has attained its present high pitch of economic prosperity. More than 50 per cent. of its working population are engaged in industry, which embraces almost all branches, of which new ones have lately sprung into existence, whilst most of the older ones have taken a new lease of life. The old wool industry, for example, has become much extended, and now embraces products such as shawls, carpets, hosiery, &c. Its silk manufactures, formerly so important, have, however, gradually gone back. It is particularly in the working of iron, steel, and cloth, and in the by-products of these, that Berlin excels. The manufacture of machinery and steam-engines shows an enormous development. No fewer than 100 large firms, many of them of world-wide reputation, are engaged in this branch alone. Among the chief articles of manufacture and production are railway plant, sewing machines, bicycles, steel pens, chronometers, electric and electric-telegraph plant, bronze, chemicals, soap, lamps, linoleum, china, pianofortes, furniture, gloves, buttons, artificial flowers, and ladies' mantles, the last of an annual value exceeding £5,000,000. The output of its 100 breweries, including those in the suburbs, reached in the year 1898-1899 the enormous total of about 80,000,000 gallons. Berlin is also the great centre and the chief market for speculation in corn and other cereals which reach it by water from Poland, Austria, and South Russia, while in commerce in spirits it rivals Hamburg.

The Börse, where 4000 persons daily do business, is the chief market in Germany for stocks and shares, and its dealings are of great influence upon the gold market of the world. Numerous banks of world-wide reputation, doing an extensive international business, have their seats in Berlin, chief among them, in addition to the Reichsbank, being the Berliner Kassen Verein, the Disconto Commandit, the Deutsche Bank, and the Boden-Credit Bank.

Learning and Art.—Berlin is rapidly becoming not only the centre of the imperial Government, but also of the intellectual life of the nation. The famous Friedrich Wilhelm University, although young in point of foundation (A.D. 1810), has long since outstripped its great rival Leipzig in point of numbers, and can point with pride to the fact that its teaching staff has yielded to none in the number of illustrious names. To its roll must now be added those of Helmholtz, van 't Hoff, Koch, E. Fischer, Waldeyer, and von Bergmann among scientists and surgeons; Mommsen, Treitschke, and Sybel among historians, Harnack among theologians, Brunner among jurists. Taking ordinary, honorary, extraordinary professors, and licensed lecturers (*privat-docenten*) together, its professorial strength consists of 21 teachers in the faculty of theology, 29 in that of law, 134 in that of medicine, and 207 in that of philosophy, altogether 391. The number of matriculated students in the winter term 1898-99 was 5873, as against 4648 in the preceding summer term; the reason of the disproportion being that in the summer term university towns having pleasant surroundings, such as Bonn, Heidelberg, Kiel, and Jena are more largely frequented, the larger towns showing an increased strength in the winter. Berlin is essentially a Prussian university, 4319 of the number above given hailing from the kingdom. Of students from non-German states, the United States of America, with 108 students, come next after Russia, while Great Britain is credited with but 21. It is, however, in the ugly palace of Prince

Henry of Prussia, which was given for the purpose in the days of Prussian poverty and distress, that the university is still housed, and although some internal rearrangement has been effected, no substantial alterations have been made to meet the ever-increasing demand for lecture-room accommodation. The garden towards Unter den Linden has been adorned by a bronze statue of Helmholtz, and by marble statues in sitting posture of Wilhelm and Alexander von Humboldt, the last a masterpiece by R. Begas. Technical education is provided in the magnificent buildings erected at a cost of £100,000 in Charlottenburg, which are equipped with all the apparatus for the teaching of science. This college was attended in the winter term 1898-99 by 2425 students. In view of the fact that Charlottenburg is rapidly replacing the Luisenstadt as a students' quarter, the project has been seriously entertained of removing thither the Royal Library, which is in intimate touch with the university and largely used by students. Among other institutions of university rank and affiliated to it are the School of Mines, the Agricultural College, the Veterinary College, the new Seminary for Oriental Languages, and the High School for Music. The Geodetic Institute has been removed to Potsdam. The university is, moreover, rich in institutions for the promotion of medical and chemical science, for the most part housed in buildings belonging to the governing body.

Schools.—Berlin possesses 19 "gymnasias" (schools for the highest branches of a learned profession), of which 6 are under the direct supervision of the provincial authorities and have the prefix *Königlich* (royal), while 11 are municipal and under the control of the civic authorities. These schools were attended in the winter term 1898-99 by 8387 scholars, of whom no less than 1989 were of the Jewish persuasion. There are also numerous Realschulen (schools in which special attention is given to instruction for the higher branches of commercial life), and these were attended by 5138 scholars. The 8 public high schools for girls showed for the same period an attendance of 5320, while the elementary parochial schools show 105,709 boys and 101,642 girls.

Museums.—Many new museums have been erected. The National Gallery, a fine building surrounded by a Corinthian colonnade, and lying between the Royal Museum and the Spree, contains many interesting modern German paintings. The Kunstgewerbe Museum, at the corner of the Königgrätzer and Albrecht Strassen, contains valuable specimens of applied art and the famous Schliemann treasures. The Royal Museum's picture gallery has become, if not one of the largest, at least one of the best collections of pictures in existence, and there are few great painters of whom it does not contain one or two masterpieces, while the sculpture gallery has been enriched by a unique collection, the result of the excavations at Pergamon.

Theatres.—In nothing has the importance of Berlin become more conspicuous than in theatrical affairs. In addition to the old-established Opernhaus and Schauspielhaus, which are supported by the State, numerous private playhouses have been erected, notably the "Lessing" theatre and the "Deutsches Theater," and it is in these that the modern works by Wildenbruch, Sudermann, and Hauptmann have been produced, and it may be said that it is in Berlin that the modern school of German drama has its home. In art Munich still holds the first place, and though in music Berlin is not able to cope with Leipzig, Dresden, or Munich, yet it is well represented by the Conservatorium, with which the name of Joachim is connected, whilst the more modern school is represented by Xaver Scharwenka.

Politics.—Ever since the revolution of 1848 and the

beginning of parliamentary life in Prussia, Berlin has been the chief support of the Radical party. In the old days of the conflict between Bismarck and the parliament Berlin always supported the opposition, and it continued to do so even after it had become the capital of the empire. It has been represented by men such as Virchow, Lasker, and Richter; and the Radicals, who have lost their influence in other parts of the country, still held in 1901 all the seats in Berlin for the Prussian Landtag. In the town council of Berlin no Conservative is able to find a seat, and they have always elected as chief burgomaster a man of strong Radical sympathies. Hence it has come about that there have been serious collisions between the town council and the court (William II. and the empress having frequently expressed their dissatisfaction with the attitude of the city of Berlin in political and religious matters), which have been intensified on more than one occasion by the fact that the emperor has refused to ratify the appointment of a Radical burgomaster. During recent years the forces of Social Democracy have succeeded in winning most of the seats from the Radicals in the elections to the Reichstag. In 1873 Berlin returned five Social Democrats and one Radical. In 1898 the proportion was four to two. In the town council also the Jews have won a large number of seats, and, of course, support the Liberal majority in the general opposition to the Government, which by such measures as the law controlling the Exchange, increased duties on food, and the support given to the more orthodox parties, has offended both the business interests and the intellectual prejudices of the city.

Environns.—Marvellous as has been the transformation in the city itself, no less surprising results have been effected since 1875 in the surroundings of Berlin. On the east, north, and west the city is surrounded at a distance of some 5 miles from its centre by a thick belt of pine woods, the Jungfernheide, the Spandauer Forst, and the Grunewald, the last named stretching away in a south-westerly direction as far as Potsdam, and fringing the beautiful chain of Havel lakes. These forests enjoyed until quite recent times an unenviable notoriety as the camping-ground and lurking-place of footpads and other disorderly characters. After the opening of the circular railway (Ringbahn) in 1871, private enterprise set to work to develop these districts, and a "villa colony" was built at the edge of the Grunewald between the station West End and the Spandauer Bock. From these beginnings, owing mainly to the expansion of the important suburb of Charlottenburg, has resulted a complete transformation of the eastern part of the Grunewald into a picturesque and delightful villa suburb, which is connected by railway, steam-tramway, and a magnificent new boulevard—the Kurfuerstendamm—with the city. Nowadays the little fishing villages on the shores of the lakes, notably the Wannsee, cater for the recreation of the Berliners, while palatial summer residences of wealthy merchants occupy the most prominent sites. Suburban Berlin may be said now to extend practically to Potsdam.

Government and Administration.—The government is partly semi-military (police) and partly municipal. The police ministry (a branch of the home office) consists of six departments: (1) general; (2) trade; (3) building; (4) criminal; (5) passport; (6) market. It controls the fire brigade and has the general inspection over all strangers, and is responsible for public order. The magistracy (the civil authority) consists (1) of a chief mayor (oberbürgermeister) and (2) of a mayor, both of whom are elected by the council (Stadtverordnete) of 144 members, of whom three are elected for each ward by manhood suffrage. Ratification by the Crown is necessary in the case of the two mayors, and no reason need be given for the withholding of such sanction. (3) Of a council (Stadträthe) of 80 members, of whom 14 are jurists and

paid, and who devote themselves exclusively to the service of the city, whilst the services of the remaining 16 are given gratuitously and their office honorary. For general work both magistrates and Stadtverordnete coalesce, and committees are appointed from their body for various purposes, which, however, are usually presided over by magistrates. Their jurisdiction extends to water-supply, the drainage, lighting and cleaning of the streets, the care of the poor, hospitals, and schools. The combined rate for all purposes amounted in 1901 to about 2s. 1d. in the £ of rental assessment.

Public Conveyances.—At the end of 1898 there were in Berlin, according to police returns, 6097 first-class cabs (victorias and broughams), mostly with fare indicators, 1842 second-class (closed cabs), 157 luggage cabs, 551 omnibuses, and 1842 tramcars. In 1898 the omnibus companies carried 53,817,422 passengers, the tramways (now mainly worked by electricity) 212,940,112, and the various local railways 362,594,886, as against 184,935,602 carried in 1888. In the summer of the same year the steamboats plying above and below the city conveyed 765,000 passengers.

Streets.—The public streets have a total length of about 290 English miles. The staff employed in maintaining and cleaning the public roads consists of 36 superior officials, inspectors, and overseers, and 1036 scavengers. The force is well controlled, and the work of cleaning and removing snow after a heavy fall is thoroughly and efficiently carried out. The less important thoroughfares are mostly paved with the so-called Vienna paving, granite bricks of medium size, while the principal streets, and especially those upon which the traffic is heavy, have either asphalt or wood paving.

Water-Supply and Drainage.—The water-supply is mainly derived from works on the Müggel and Tegeler lakes, the river water being carefully filtered through sand. The drainage system is elaborate, and has stood the test of time. The city is divided into twelve radial systems, each with a pumping station, and the drainage is forced through five mains to eighteen sewage farms, each of which is under careful sanitary supervision, in respect both of the persons employed thereon, and the products, mainly milk, passing thence to the city for human consumption. Only in a few isolated cases has any contamination been traced to fever or other zymotic germs. In this connexion it is worth noting that the infectious diseases hospital has a separate system of drainage which is carefully disinfected, and not allowed to be employed for the purposes of manure.

Hospitals.—In no other city of the world is the hospital organization so well appointed as in Berlin, or are the sick poor tended with greater solicitude. State, municipal, and private charity here again join hands in the prompt relief of sickness and cases of urgency. The municipal hospitals are 5 in number, the largest of which is that of Friedrichshain, which is built on the pavilion system, while the State controls 6, of which the world-renowned Charité in the Luisenstrasse is the principal. The hospitals of the nursing sisters (Diaconissen Anstalten) number 8, while there are no less than 51 registered private hospitals under the superintendence of responsible doctors and under the inspection of Government. In all there are 70 hospital establishments with a grand total (1898) of 7677 beds.

Charities.—Berlin is also very richly endowed with charitable institutions for the relief of pauperism and distress. In addition to the municipal support of the poor-houses there are large funds derived from bequests for the relief of the necessitous and deserving poor; while night shelters and people's kitchens have been organized on an extensive scale for the temporary relief of the indigent unemployed. For the former several of the arches of the city railway have been utilized, and correspond in internal arrangement to the like shelters instituted by the Salvation Army in London and various other cities.

Markets.—Open market-places in Berlin are things of the past, and their place has been taken by airy and commodious market halls. Of these, 15 in number, the central market, close to the Alexander Platz station of the city railway with which it is connected by an admirable service of lifts for the rapid unloading of goods, is the finest. It has a ground area of about 17,000 square yards, and is fitted with more than 2000 stalls. The other markets are conveniently situated at various accessible places within the city, and the careful police supervision to which they are subjected, both in the matter of general cleanliness, and in the careful examination of all articles of food exposed for sale, has tended to the general health and comfort of the population.

Abattoir.—The central cattle market and slaughter-houses for the inspection and supply of the fresh meat consumed in the metropolis occupies an extensive area in the north-east of the city on the Ringbahn, upon which a station has been erected for the accommodation of meat trains and passengers attending the market. It is under the superintendence of 72 inspectors-in-chief, and employs altogether 3317 persons. In 1898-99 there were slaughtered 153,675 cattle, 150,202 calves, 409,302 sheep, and 659,553 pigs, altogether 1,372,732 animals. The inspection is

rigorously carried out, and only carcasses which have been stamped as having been certified good are permitted to be taken away for human consumption.

Finance.—For the year 1898-99 the receipts into the municipal exchequer amounted to 130.8 millions of marks and the expenditure to 123 millions, showing a surplus of 7.8 millions of marks. The chief items of the receipts were: taxes, 59,864,508; capital and debt administration, 12,791,719; municipal works, 7,006,660; building, 5,927,260; education, 2,868,482; sanitary department, 2,034,895; and poor, 1,190,849 marks. The chief items of expenditure were as follows: building, 25,261,735; education, 20,457,479; capital and debt administration, 16,467,028; poor, 11,810,676; administration, 10,418,715; police, 5,988,267; lighting and street cleaning, 3,698,464 marks.

Edinburgh, 1893. (P. A. A.)

Berlin, a town and port of entry, Ontario, Canada, and capital of Waterloo county, 58 miles W. of Toronto, on the Grand river and the Grand Trunk Railway. It is a flourishing manufacturing town, and contains leather, furniture, shirt and collar, felt, glove, button, and rubber factories. The exports for 1898-99 were \$595,773, and imports, \$876,784. Population (1881), 4054; (1899), 9359.

Berlin, a city of Coos county, New Hampshire, U.S.A., on the Androscoggin river in the White Mountains, in the northern part of the state, on the Grand Trunk and the Boston and Maine Railways. It is in a heavily forested region, and contains lumber camps, sawmills, and pulp-mills. The development of these industries has caused a large influx of population, which increased from 3729 in 1890 to 8886 in 1900.

Bermudas, a group of about 360 coralline islets in the North Atlantic, 580 miles E. of North Carolina, and 677 from New York, 64° 50' W., and 31° 55' to 32° 20' N., this latitude marking the extreme northern range of the coral-building polyps. The total area is 20 square miles, and the population in 1898 was 16,300 (6000 whites, and over 10,000 blacks and coloured), chiefly centred in the horseshoe-shaped St George, which is much the largest of the 18 or 20 inhabited islands, the next in size being St David, Bermuda, Gates, Cooper, Somerset, Bird, and Ireland. The group became an important naval and coaling station in 1869, when a large iron dry dock was towed across the Atlantic and placed in a secure position in St George. The islands are encircled, especially on the north and west, by fringing reefs which are still growing, but leave a few deep passages wide enough to admit the largest vessels. They are now connected by submarine cables with Nova Scotia, Turks Islands, and Jamaica, and, owing to their important strategic position in mid-Atlantic, the British Government maintains a strong garrison of over 3000 men. The imports rose from £286,000 in 1894 to £351,000 in 1898, and the exports from £98,000 to £113,000 in the same period; revenue (1898), £39,000; expenditure, £39,100; debt, £45,600. Most of the food supplies come from the United States and Canada, which countries take in exchange nearly all the exported farm produce, such as onions, potatoes, and lily bulbs. The Bermudas are a British crown colony, with a governor resident at the capital, Hamilton, on Bermuda or Main Island, who is assisted by an executive council of six members appointed by the Crown, a legislative council of nine similarly appointed, and a representative assembly of thirty-six members returned by about 112 voters. (A. H. K.)

Bermudez, a former state of Venezuela, now divided into the states of Barcelona and Sucre, was formed by the districts of Barcelona, Cumaná, and Maturín. It is bounded on the N. by the Caribbean Sea, on the S. by the

state of Bolívar; on the E. by the Gulf of Paria and the delta of the Orinoco, and on the W. by the former state of Miranda. Its area is over 31,000 square miles, and its population exceeds 300,000. The state is divided into 22 districts. The capital of the state of Barcelona is the town of the same name (population, 9000); that of Sucre is Cumaná.

Bern, one of the Swiss cantons. Politically it comes after Zürich, even though Bern is the Federal capital. Its total area is 2657 square miles. Of this 2172 square miles are classed as "productive," 586 square miles being covered by forests, and 2½ square miles by vineyards. Of the 485 "unproductive" square miles, 111.3 square miles are covered by glaciers, while a large space is occupied by different lakes. **Population.**—(1880) 530,411, (1900) 587,983. In 1900 there were 221 inhabitants to each square mile. **Religions.**—Protestants, (1880) 463,163, (1900) 506,837; Romanists, (1880) 65,828, (1900) 81,162; Jews, (1880) 1316, (1900) 1572. **Language.**—German-speaking, (1880) 452,039, (1900) 484,544; French-speaking, (1880) 78,640, (1900) 98,132; Italian-speaking, (1900) 4374.

The capital is Bern. The cantonal constitution dates from 1893. The legislature is elected by popular vote in the proportion of one member per 2500 (or fraction over 1250) inhabitants, and is renewed every four years. It elects the nine members of the executive who also hold office for four years. The "obligatory referendum" obtains in the case of all laws, while 12,000 citizens have the right of "initiative" in the case of legislative projects, and 15,000 may demand the revision of the cantonal constitution. In 1897 the state revenue was 27,715,498 frcs. (a rise of 34½ per cent. since 1885), and the state expenditure 27,712,525 frcs. (also a rise of 34½ per cent. since 1885), but in 1898 there was a deficit of 71,640 frcs., while in 1900 there was one of 1,118,685 frcs. In 1897 the public debt was 98,697,000 frcs. There are now many railways in the canton, particularly mountain railways, e.g., to Grindelwald, Lauterbrunnen, Mürren, over the Wengern Alp (or Little Scheidegg), to the Schynige Platten, up the Gurten, &c.; there is even a railway up the Jungfrau in course of construction.

The canton (admitted in 1353) grew out of the conquests and acquisitions of the town of Bern (founded in 1191). The dates of some of these are as follows:—Muri, 1295; Hasli, 1334; Burgdorf and Thun, 1384; Frutigen, 1400; Upper Simmenthal and Unterseen, 1386; Emmenthal, 1420; Lower Simmenthal, 1448-49; Grindelwald and Lauterbrunnen, 1528; and part of the Gruyère, 1555. At the time of the French Revolution (1798), Bern lost many of its former subject lands, e.g., Aargau (1415), Aigle and Grandson (1475), and Vaud (1536). But in 1815 the Congress of Vienna gave the Canton (besides the town of Biel) what is now called the "Bernese Jura," formerly belonging to the prince-bishop of Basel. This last acquisition, being Romanist and French-speaking, has been a great source of trouble to the canton, as it introduced two discordant elements.

Bern, the capital of the canton of that name, and since 1848 the political capital of the Swiss confederation, Zürich being the seat of the federal Polytechnic School, and Museum, and Lausanne the home of the federal tribunal. The Aar is crossed by five lofty bridges, the most recent of which (Kirchfeld and Kornhaus) have done much to create new quarters on the north and south of the old town respectively. The most considerable building in the town is the double Bundesrathhaus, the new portion of which was completed in 1901. Bern never was the see of a bishop, so that it is wrong to give the name of cathedral to the collegiate church or Münster, built in the 15th century, and recently restored. The university (founded in 1834) was attended during the summer of 1901 by 1055 matriculated students (besides 111 "hearers"), the faculty of philosophy being

the most numerous. The town library contains about 85,000 volumes, but the historical relics have now been transferred to the new historical museum on the Kirchfeld, which also houses archaeological and ethnological collections. On the Kirchfeld the federal library is now being built. The strict aristocratic government of the town dates from 1295 and lasted till 1798. Population, 63,994.

Bernard, Claude (1813-1878), French physiologist, was born on 12th July 1813, in the village of Saint-Julien, near Villefranche. He received his early education in the Jesuit school of that town, and then proceeded to the college at Lyons, which, however, he soon left to become assistant in a druggist's shop. His leisure hours were devoted to the composition of a vaudeville comedy, *La Rose du Rhône*, and the success it achieved moved him to attempt a prose drama in five acts, *Arthur de Bretagne*. At the age of twenty-one he went to Paris, armed with this play and an introduction to Saint-Marc Girardin, but the critic dissuaded him from adopting literature as a profession, and urged him rather to take up the study of medicine. This advice he followed, and in due course became "interne" at the Hôtel Dieu. In this way he was brought into contact with the great physiologist Magendie, who was physician to the hospital, and whose official "préparateur" at the Collège de France he became in 1841. Six years afterwards he was appointed his deputy-professor at the Collège, and in 1855 he succeeded him as full professor. Some time previously he had been chosen the first occupant of the newly-instituted chair of physiology at the Sorbonne. There no laboratory was provided for his use, but Louis Napoleon, after an interview with him in 1864, supplied the deficiency, at the same time building a laboratory at the Natural History Museum in the Jardin des Plantes, and establishing a professorship, which Bernard left the Sorbonne to accept in 1868—the year in which he was admitted a member of the Institute. He died in Paris on 10th February 1878, and was accorded a public funeral—an honour which had never before been bestowed by France on a man of science.

Claude Bernard's first important work was on the functions of the pancreas gland, the juice of which he proved to be of great significance in the process of digestion; this achievement won him the prize for experimental physiology from the Academy of Sciences. A second investigation—perhaps his most famous—was on the glycogenic function of the liver; in the course of this he was led to the conclusion, which throws light on the causation of diabetes, that the liver, in addition to secreting bile, is the seat of an "internal secretion," by which it prepares sugar at the expense of the elements of the blood passing through it. A third research resulted in the discovery of the vaso-motor system. While engaged, about 1851, in examining the effects produced in the temperature of various parts of the body by section of the nerve or nerves belonging to them, he noticed that division of the cervical sympathetic gave rise to more active circulation and more forcible pulsation of the arteries in certain parts of the head, and a few months afterwards he observed that electrical excitation of the upper portion of the divided nerve had the contrary effect. In this way he established the existence of vaso-motor nerves—both vaso-dilatator and vaso-constrictor. The study of the physiological action of poisons was also a favourite one

with him, his attention being devoted in particular to curare and carbon monoxide gas. The earliest announcements of his results, the most striking of which were obtained in the ten years from about 1850 to 1860, were generally made in the recognized scientific publications; but the full exposition of his views, and even the statement of some of the original facts, can only be found in his published lectures. The various series of these *Leçons* fill seventeen octavo volumes. In addition he published an *Introduction to the Study of Experimental Medicine* in 1865, and a few years later a volume on *General Physiology*.

An English *Life of Bernard*, by Sir Michael Foster, was published in London in 1899. (H. M. R.)

Bernburg, a town of Germany, duchy of Anhalt, on the Saale, 29 miles N. by W. from Halle by rail. A bronze statue of Bismarck was unveiled in 1896. It is the seat of considerable industry, manufacturing machinery and boilers, sugar, pottery, and stoneware, briquettes, chemicals, and lead and zinc smelting. Gardening is extensively carried on. Population (1885), 21,644; (1895), 32,374; (1900), 34,427.

Bernhardt, Sarah [ROSINE BERNARD] (1845—), French actress, was born in Paris, 22nd October 1845, of mixed French and Dutch parentage, and of Jewish descent; she was, however, baptized at the age of twelve and educated in a convent. Her earliest years were spent in Holland. When she was thirteen she entered the Paris Conservatoire, where she gained the second prize for tragedy in 1861 and the same for comedy in 1862. Her first appearance at the Comédie Française was made in a minor part in Racine's *Iphigénie* without any marked success, and her career there was speedily interrupted by her having the temerity to slap the face of one of the "leading ladies," whom she considered to have insulted her sister. After a year spent in playing burlesque parts at the Porte St. Martin and Gymnase theatres, she took a sudden trip to Spain; but having spent all her money, she returned, and became a member of the company at the Odéon in 1867. There she made her first definite success as the Queen in *Ruy Blas*. During the siege of Paris she organized an ambulance service in the theatre. When peace was restored she left the Odéon for the Comédie Française, thereby incurring a considerable monetary forfeit. Her *début* at the Comédie Française was made in November 1872 as Gabrielle in *Mademoiselle de Belle Isle*. From that time she steadily increased her reputation, in spite of an uphill fight against adverse criticism, two of the most definite steps in her progress being her performances as Phèdre (in December 1874), and Doña Sol in *Hernani* (in November 1877). In 1879 she came to London with the company of the Comédie Française for their famous season at the Gaiety Theatre. By this time her position was securely established. Her amazing power of emotional acting, the extraordinary realism and pathos of her death scenes, the magnetism of her personality, and the beauty of her "voix d'or,"—which could now rage like a tiger, now coo like a dove,—made the public tolerant of her occasional caprices. She had developed some skill as a sculptor, and exhibited at the Salon at various times between 1876 and 1881, gaining honourable mention in 1876. She also exhibited a painting there in 1880. In 1878 she published a prose sketch, *Dans les Nuages*. Her relations with the other *sociétaires* of the Comédie Française having become somewhat strained, a crisis arrived in 1880, when, enraged by an unfavourable criticism of her acting, she threw up her position on the day following the first performance of Augier's *L'Aventurière*. This obliged her to pay a forfeit of

£4000 for breach of contract. Immediately after the rupture she gave a series of performances in London, relying chiefly upon *Adrienne Lecouvreur* and *Frou Frou*. These were followed by tours in Denmark, America, and Russia, during 1880 and 1881, with *La Dame aux Camélias* as the principal attraction. In April 1882 she married M. Jacques Damala, a Greek, in London, but separated from him at the end of the following year. After a fresh triumph in Paris with *Fédora* at the Vaudeville, she became proprietress of the Porte St. Martin theatre. *Nana Sahib* (1883), *Théodora* (1884), *La Tosca* (1887), *Jeanne d'Arc* (1890), and *Cléopâtre* (1890), were among her most conspicuous successes at the Porte St. Martin, where she remained till she became proprietress of the Renaissance Theatre in 1893. During those ten years she made several extended tours, including visits to America in 1886-87 and 1888-89. Between 1891 and 1893 she again visited America (North and South), Australia, and the chief European capitals. In November 1893 she opened the Renaissance Theatre with *Les Rois*, which was followed by *Izyl* (1894), *Gismonda* (1894), *La Princesse Loïtaine* (1895). For the next few years she visited London almost annually, and America in 1896. In the autumn of 1896 she made a success with *Lorenzaccio*; and in Easter week of 1897 furnished her audiences with a new sensation by giving performances of a religious drama, *La Samaritaine*, by M. Rostand. In December 1896 an elaborate fête was organized in Paris in her honour; and the value of this public recognition of her position at the head of her profession was enhanced by cordially appreciative greetings from all parts of the world. Early in 1899 she removed from the Renaissance to the Théâtre des Nations, a larger house, which she opened in January with a revival of *La Tosca*. In May of the same year she made the bold experiment of a production of *Hamlet*, in which she played the part of the prince of Denmark. She repeated the impersonation in London not long afterwards, where she also appeared (in 1901) in M. Rostand's *L'Aiglon*, which had been produced in Paris the year before.

Bertani, Agostino (1812-1886), Italian revolutionist, was born at Milan, 19th October 1812. He took part in the insurrection of 1848, though opposed to the fusion of Lombardy with Piedmont. During the Roman republic of 1849, he, as medical officer, organized the ambulance service, and, after the fall of Rome, withdrew to Genoa, where he worked with Sir James Hudson for the liberation of the political prisoners of Naples, but held aloof from the Mazzinian conspiracies. In 1859 he founded a revolutionary journal at Genoa, but, shortly afterwards, joined as surgeon the Garibaldian corps in the war of 1859. After Villafranca he became the organizer-in-chief of the expeditions to Sicily, remaining at Genoa after Garibaldi's departure for Marsala, and organizing four separate volunteer corps, two of which were intended for Sicily and two for the Papal States. Cavour, however, obliged all to sail for Sicily. Upon the arrival of Garibaldi at Naples, Bertani was appointed secretary-general of the Dictator, in which capacity he re-organized the police, abolished the secret service fund, founded twelve infant asylums, suppressed the duties upon Sicilian products, prepared for the suppression of the religious orders, and planned the sanitary reconstruction of the city. Entering Parliament in 1861, he opposed the Garibaldian expedition, which ended at Aspromonte, but nevertheless tended Garibaldi's wound with affectionate devotion. In 1866 he organized the medical service for the 40,000 Garibaldians, and, in 1867, fought at Mentana. His parliamentary career, though marked by zeal, was less brilliant than his revolu-

tionary activity. Up to 1870 he remained an agitator, but, after the liberation of Rome, seceded from the historic Left, and became leader of the extreme Left, a position held until his death on 30th April 1886. His chief work as deputy was an inquiry into the sanitary conditions of the peasantry, and the preparation of the sanitary code, adopted by the Crispi Administration. (H. W. S.)

Berthelot, Pierre Eugene Marcellin (1827—), French chemist and politician, was born at Paris on the 29th of October 1827, being the son of a doctor. After distinguishing himself at school in history and philosophy, he turned to the study of science. In 1851 he became a member of the staff of the Collège de France as assistant to Balard, his former master, and in 1854 he made his reputation by his doctoral thesis, *Sur les combinaisons de la glycérine avec les acides*, which described a series of beautiful researches in continuation and amplification of Chevreul's classical work. In 1859 he was appointed professor of organic chemistry at the École Supérieure de Pharmacie, and in 1865 he accepted the new chair of organic chemistry, which was specially erected for his benefit at the Collège de France. He became a member of the Academy of Medicine in 1863, and ten years afterwards entered the Academy of Sciences, of which he became perpetual secretary in 1889 in succession to Pasteur. During the siege of Paris he was president of the scientific defence committee, and the experience he gained in that capacity in the manufacture of gunpowder and other munitions of war especially turned his attention to the study of thermo-chemistry as applied to explosives. The results of his researches were published in his book *Sur la force de la poudre et des matières explosives* (1872), which was subsequently followed by the more general treatises, each in two volumes, on *Mécanique chimique fondée sur la thermo-chimie* (1879), and *Thermo-chimie* (1897). In the domain of organic chemistry his name is associated with many important discoveries, and in particular he is remarkable for the wide application of synthetic methods in his investigations. Among the books he published on this branch of chemistry may be mentioned *Chimie organique fondée sur la synthèse* (1860), *Leçons sur les principes sucrés* (1862), *Leçons sur les méthodes générales de synthèse* (1864), and *Leçons sur l'isomérisie* (1865). Students of chemical history are also greatly indebted to M. Berthelot for his book on *Les origines de l'alchimie* (1885), and his *Introduction à l'étude de la chimie des anciens et du moyen-âge*, as well as for editing various old treatises on alchemy and chemistry. His scientific jubilee was celebrated in Paris in 1901. As to his official life, he was appointed inspector-general of higher education in 1876, and after his election as life senator in 1881 he continued to take an active interest in educational questions, especially as affected by compulsory military service. In M. Goblet's short-lived ministry of 1886-87 he was minister of public instruction, and in the Bourgeois cabinet of 1895-96 he held the portfolio for foreign affairs.

Bertillon, Alphonse (1853—), French criminologist, was born in Paris in 1853. He was the son of LOUIS ADOLPHE BERTILLON, a distinguished anthropologist (1821-83), and brother to JACQUES BERTILLON, a statistician (born 1851), and is sometimes confounded with one or other of these. He published in 1882 a work on *Les races sauvages*, but his chief claim to distinction lies in the system invented by him for the identification of criminals, which is described in an appendix to his *Photographie judiciaire* (Paris, 1890), and has been in use since 1883. Whenever a person passes through the hands of the police, exact measurements are taken—comprising (1) length of head, (2) breadth of head, (3) length of left middle

finger, (4) length of left foot, (5) length of left forearm to the tip of the middle finger—and recorded on a card. The whole of the cards are arranged in three classes according as the first measurement is long, medium, or short; each of these again into three, according to the character of the second measurement, and so on. The number of cards in each subdivision at the end of this process is generally about a dozen, and identification is rendered complete by certain other measurements and observations, and by photographs of the full face and of the profile (right side). On the recommendation of a committee appointed in 1893 by Mr. Asquith, the Bertillon system has been introduced into England, and is used in conjunction with the system of identification by Mr. Francis Galton. (See ANTHROPOMETRY.) M. Bertillon was officially appointed in 1894 to report on the handwriting of the *bordereau* in the Dreyfus case, and was a witness for the prosecution before the Cour de Cassation on 18th January 1899.

Berwick-upon-Tweed, a seaport and municipal borough in the Berwick parliamentary division of Northumberland, England, on the northern bank of the Tweed, 47 miles E.S.E. of Edinburgh by rail. In 1899 307 vessels entered with 28,949 tons, and 305 cleared with 28,949 tons. Population of municipal borough (area, 6507 acres) (1881), 13,998; (1901), 13,437 (Berwick, 8277; Tweedmouth, 3086; Spittal, 2074).

Berwickshire, a maritime county of Scotland, forming its S.E. extremity, is bounded on the N.E. by the German Ocean, on the N. by Haddingtonshire, on the W. by Mid-Lothian, on the S.W. by Roxburgh, on the S. by the Tweed, which separates it from Northumberland, and on the S.E. by Berwick-on-Tweed.

Area and Population.—In 1891 the parish of Oldhamstocks was placed wholly in Haddingtonshire, and the Berwick portion of the parishes of Lauder, Earliston, and Mertoun were transferred to parishes in Roxburgh. According to the last official estimate the area of the county (foreshore excluded) is 293,946 acres, or about 459 square miles. The population was in 1881, 35,383; in 1891, 32,406; in 1891, on the above area, 32,290, of whom 15,383 were males and 16,907 females. On the old area, taking land only (294,805 acres or 460·6 square miles), the number of persons to the square mile in 1891 was 70, and the number of acres to the person 9·1. In the registration county the decrease of population between 1881 and 1891 was 8·1 per cent. In 1901 the population was 30,816. Between 1881 and 1891 the excess of births over deaths was 3711, and the decrease of the resident population 2970. The following table gives particulars of births, deaths, and marriages in 1880, 1890, 1899 :—

Year.	Deaths.	Marriages.	Births.	Percentage of Illegitimate.
1880	557	182	1020	10·0
1890	475	178	787	9·40
1899	440	178	685	9·6

The following table gives the birth-rate, death-rate, and marriage-rate per thousand of the population for a series of years :—

	1880.	1881-90.	1890.	1891-98.	1899.
Birth-rate . . .	28·85	26·60	24·19	23·14	22·89
Death-rate . . .	15·75	15·62	14·60	13·98	14·70
Marriage-rate . .	5·15	4·80	5·47	5·49	5·94

In 1891 the number of Gaelic-speaking persons in the county was 89, and of foreigners 54. Valuation in 1889-90, £328,457; 1899-1900, £310,720.

Administration.—The county returns a member to parliament. Lauder (803) is the only royal burgh, and it has now no separate representation. Greenlaw is the county town, but steps are being taken to transfer the administrative machinery to Duns (2206), which is a police burgh. The civil parishes number 32. The number of paupers and dependants in September 1899 was 646. Berwickshire forms a sheriffdom with Roxburgh and Selkirk shires, and there is a resident sheriff-substitute at Duns, who sits also at Greenlaw, Coldstream, Ayton, and Lauder.

Education.—Thirty-two school boards manage 64 schools, which

had an average attendance of 3882 in 1898-99, and 2 voluntary schools had 72. There is a high school, which is also a technical school, at Duns, and Coldstream and Lauder public schools have secondary departments. Duns school is subsidized by the county council, which pays the expenses of students attending it from a distance.

Agriculture.—The cultivated area was 64·7 of the whole in 1898. Farming is high, and is mixed in the Merse, or borderland, and generally pastoral in the uplands. The following table gives the principal acreages at intervals of five years from 1880 :—

Year.	Area under Crops.	Corn Crops.	Green Crops.	Clover.	Permanent Pasture.	Fallow.
1880	194,562	64,044	35,074	58,645	36,517	262
1885	197,290	63,321	32,830	60,488	40,373	278
1890	197,963	59,722	32,400	61,338	44,321	162
1895	191,983	56,928	32,175	58,394	44,418	47
1899	190,701	57,626	31,826	58,182	42,978	64

The following table gives particulars of the live stock during the same years :—

Year.	Total Horses.	Total Cattle.	Cows or Heifers in Milk or Calf.	Sheep.	Pigs.
1880	5412	16,571	8417	267,901	3873
1885	5482	19,415	3782	287,544	4663
1890	5521	17,649	3256	311,440	4974
1895	5836	15,936	3100	307,365	4530
1899	5449	16,832	3119	315,958	3796

Large farms predominate; indeed, the average size of holding—221 acres for 867 farms—is the highest in the kingdom. In 1895, 15·80 per cent. were under 5 acres, 23·41 between 5 and 50 acres, and 60·79 over 50. Sixty-nine holdings were between 50 and 100 acres, 218 between 100 and 300, 120 between 300 and 500, 100 between 500 and 1000, and 20 over 1000 acres. The acreage under wood in 1895 was 15,378. According to the census of 1891, there were 4620 men and 1498 women in the county engaged in agriculture.

Industries and Trade.—The industrial population in 1891 numbered 3279 men and 1075 women. The season for herring is from May to the middle of September, and for white fish from October to the end of May. Eyemouth, Burnmouth, and St. Abb's Head form the Scottish division of the Eyemouth fishery district, which includes a number of Northumberland ports, and for which statistics are given below :—

Year.	Boats.			Value of Gear.	Resident Fishermen and Boys.	Total Value of all Fish.
	No.	Tons.	Value.			
1890	485	4850	£23,236	£30,673	1214	£49,765
1898	165	2269	£13,839	£19,289	545	£29,075
1899	159	2359	£14,977	£22,602	535	£51,133

The value of the herring catch only in 1899 was £33,459. During 1899, 1252 persons were employed in the district in connexion with the various branches of the sea fisheries. The salmon fisheries of the Tweed are very valuable. A light railway (10½ miles) from the Waverley line to Lauder was built in 1900.

Besançon, chief town of department Doubs, France, 241 miles S.E. of Paris, on the railway from Dijon to Belfort. It is the headquarters of the 7th army corps. The ancient library contains nearly 140,000 volumes and 1850 manuscripts, besides 10,000 medals, and there is a popular library with 10,000 volumes. A statue of Cardinal Granvelle (16th cent.) was erected in 1897. The watch-making industry employs about one-fifth of the population, and is said to supply four-fifths of the watches sold in France. The actual number made in 1896 was

113,418 in gold and 345,706 in silver. In recent years considerable advance has been made in enamelling and other decorative processes in connexion with this industry. There is a national school of watch- and clock-making. Population (1881), 39,800; (1896), 36,942, (comm.) 49,178.

Besant, Sir Walter (1836-1901), English author, was born at Portsmouth, 14th August 1836, third son of William Besant of that town. He was educated at King's College, London, and Christ's College, Cambridge, of which he was a scholar. He graduated in 1859 as 18th wrangler, and from 1861 to 1867 was senior professor of the Royal College, Mauritius. From 1868 to 1885 he acted as secretary to the Palestine Exploration Fund. In 1884 he was mainly instrumental in establishing the Society of Authors, a trade-union of writers designed for the protection of literary property, which has rendered great assistance to inexperienced authors by explaining the principles of literary profit. Of this society he was chairman from its foundation in 1884 till 1892. He married Mary, daughter of Mr Eustace Foster-Barham of Bridgwater, and was knighted in 1895. He died at his house, Frogna End, Hampstead, on the 9th of June 1901. Sir Walter Besant practised many branches of literary art with success, but he is most widely known for his long succession of novels, many of which have enjoyed remarkable popularity. His first stories were written in collaboration with Mr James Rice, and two at least of these, *The Golden Butterfly* and *Ready-Money Mortiboy*, are among the most vigorous and most characteristic of his works. Though not without exaggeration and eccentricity, attributable to the influence of Dickens, they are full of rich humour, shrewd observation, and sound common-sense, and contain characters which have taken their place in the long gallery of British fiction. After Rice's death, Sir Walter Besant continued to write alone, and in *All Sorts and Conditions of Men* (1882) produced a stirring story of East End life in London, which set on foot the movement that culminated in the establishment of the People's Palace in the Mile End Road. Other popular novels from his pen were *Dorothy Forster*, *Armored of Lyonesse*, and *Beyond the Dreams of Avarice*. He also wrote critical and biographical works, including *The French Humorists*, *Rabelais*, and lives of Coligny, Whittington, Captain Cook, and Richard Jefferies, and undertook a series of important historical and archaeological volumes, dealing with the associations and development of the various districts of London—a "survey" of the metropolis of the present day. His books on *London*, *Westminster*, and *South London* showed that his mind was full of an attractive subject. No man of his time evinced a keener interest in the professional side of literary work, and the improved conditions of the literary career in England were largely due to his energetic and capable exposition of the commercial value of authorship and to the unselfish efforts which Sir Walter constantly made on behalf of his fellow-workers in the field of letters. (A. W.A.)

Bessarabia, a province of south-west Russia, on the Black Sea, bounded by Bukovina (Austria) in the N.W., Rumania in the W. and S., the Black Sea in the S.E., and the Russian provinces of Kherson and Podolia in the N.E. and N. It occupies the space between the Dniester and the Pruth, and, since the Berlin treaty, is separated by the Kilia mouth of the Danube from the Dobruja belonging to Rumania. Area, 17,619 square miles.

Owing to its fertile black earth soil, its level prairies, and its warm climate (year, 50° at Kishineff; January, 26°; July, 72°; 25·2 inches of rain and snow), wheat growing and the culture of the vine and tobacco, as also the raising of fine breeds of sheep, are prosperous. Nearly one half of the total surface (4,468,000

acres) is under corn crops, 1,229,000 acres under meadows, 689,500 under forests, 241,950 under vineyards (17,000,000 gallons of wine), and 4180 under tobacco. Wheat, barley, and linseed, as also wine and wool, are exported. Industry is developing, and there are now several woollen-cloth mills, three foundries, soap-works and tanneries.

The Dniester, down which considerable amounts of timber and wooden ware are shipped from Galicia, as also corn and wool within Bessarabia itself, is an important artery of navigation. Steamers ply up to Moghilev, and on the Pruth up to Leovo. Bessarabia is also well provided with railways, three branches of the Woloczisk to Odessa railway starting westwards and ramifying towards the Rumanian frontier. Population, 988,431 in 1860; 1,933,436 in 1897, of whom 942,179 women, and 302,852 living in towns. Divided into eight districts, the chief towns of which are:—Kishineff, capital of the government (108,796 inhabitants in 1897), Akkerman (28,308), Bendery (31,851), Byeltsy (18,526), Izmail (31,293), Khotin (18,126), Orghyeff (13,356), and Soroki (15,800). Kagul (7094), on the Pruth, and Reni (6946), on the Danube, a railway terminus opposite Galatz in Rumania, are also worth mentioning.

After the Mongol invasion the Genoese founded their colonies at the mouth of the Dniester. Later the territory became tributary to, and subsequently was annexed by Turkey. Russian troops, in their wars against Turkey, took possession of it five times from 1711 to 1812, when it was finally annexed to Russia. In 1829 the delta of the Danube was added to Bessarabia, but was returned to Turkey by the Paris treaty. Out of it was made the Dobruja, the northern part of which became Russian again in 1878. Bessarabia was peopled in the 19th century by a very motley crowd of Russian immigrants, runaway serfs and Nonconformists, Germans, Greeks, and Bulgarians, in addition to its indigenous inhabitants, Moldavians, and Little Russians (Galicians), with an addition of Jews (181,000) and gipsies, part of whom were serfs. (P. A. K.)

Bessemer, a town of Jefferson county, Alabama, U.S.A., a few miles south-west of Birmingham, a little north of the centre of the state, and on the Southern, the Queen and Crescent, the Louisville and Nashville, and the Kansas City, Memphis and Birmingham railways. It is in the Alabama coal and iron region, and its industries consist chiefly in the smelting and manufacture of iron. Population (1890), 4544; (1900), 6358.

Bessemer, Sir Henry (1813-1898), English engineer, was born on 19th January 1813, at Charlton, in Hertfordshire. Throughout his life he was a prolific inventor, but his name is chiefly known in connexion with the Bessemer process for the manufacture of steel, by which it has been rendered famous throughout the civilized world. Though this process is now largely supplemented, and even displaced, by various rivals, at the time it was brought out it was of enormous industrial importance, since it effected a great cheapening in the price of steel, and led to that material being widely substituted for others which were inferior in almost every respect but that of cost. Bessemer's attention was drawn to the problem of steel manufacture in the course of an attempt to improve the construction of guns. Coming to the conclusion that if any advance was to be made in artillery better metal must be available, he established a small ironworks in St. Pancras, and began a series of experiments. These he carried on for two years before he evolved the essential idea of his process, which is to effect the decarbonization necessary to convert cast iron into steel by forcing a blast of air through the mass of metal when in the molten condition. The first public announcement of the process was made at the Cheltenham meeting of the British Association in 1856, and immediately attracted considerable notice. Many metallurgists were sceptical on theoretical grounds about his results, and only became convinced when they saw that his process was really able to convert melted cast iron into malleable iron in a perfectly fluid state. But though five firms applied without delay for licenses to work under his patents, success did not at once attend his efforts; indeed, after several ironmasters had put the process to practical trial and failed to get good results, it was in danger of being thrust aside and entirely

forgotten. Its author, however, instead of being discouraged by this lack of success, continued his experiments, and in two years was able to turn out a product, the quality of which was not inferior to that yielded by the older methods. But when he now tried to induce makers to take up his improved system, he met with general rebuffs, and finally was driven to undertake the exploitation of the process himself. To this end he erected steelworks in Sheffield, on ground purchased with the help of friends, and began to manufacture steel. At first the output was insignificant, but gradually the magnitude of the operations was enlarged until the competition became effective, and steel traders generally became aware that the firm of Henry Bessemer and Co. was underselling them to the extent of £20 a ton. This argument to the pocket quickly had its effect, and licenses were applied for in such numbers that, in royalties for the use of his process, Bessemer received a sum in all considerably exceeding a million sterling.

Of course, patents of such obvious value did not escape criticism, and invalidity was freely urged against them on various grounds. But Bessemer was fortunate enough to maintain them intact without litigation, though he found it advisable to buy up the rights of one patentee, while in another case he was freed from anxiety by the patent being allowed to lapse in 1859 through non-payment of fees. There is good reason to think that in this latter instance there was real danger. Bessemer, in fact, practically admitted this to be his own opinion by granting the inventor, Robert Mushet, an annuity for life. At the outset he had found great difficulty in making steel by his process—in his first licenses to the trade iron alone was mentioned. Experiments he made with South Wales iron were failures because the product was devoid of malleability; Mr Göransson, a Swedish ironmaster, using the purer charcoal pig-iron of that country, was the first to make good steel by the process, and even he was successful only after many attempts. His results prompted Bessemer to try the purer iron obtained from Cumberland hæmatite, but even with this he did not meet with much success, until Mushet showed that the addition of a certain quantity of *spiegeleisen* (a pig-iron containing manganese) had the effect, for whatever reason, of removing the difficulties. Whether or not Mushet's patents could have been sustained, the value of his procedure was shown by its general adoption in conjunction with the Bessemer method of conversion. At the same time it is only fair to say that whatever may have been the conveniences of Mushet's plan, it was not absolutely essential; this Bessemer proved in 1865, by exhibiting a series of samples of steel made by his own process alone. The pecuniary rewards of Bessemer's great invention came to him with comparative quickness; but it was not till 1879 that the Royal Society admitted him as a fellow and the Government honoured him with a knighthood.

Among Bessemer's numerous other inventions, not one of which attained a tithe of the success or importance of the steel process, were movable dies for embossed stamps, a gold paint, sugar machinery, and a ship which was to save her passengers from the miseries of *mal de mer*. This last had her saloon mounted in such a way as to be free to swing relatively to the boat herself, and the idea was that this saloon should be always maintained steady and level, no matter how rough the sea. For this purpose hydraulic mechanism of Bessemer's design was arranged under the control of an attendant, whose duty it was to keep watch on a spirit-level, and counteract by proper manipulation of the apparatus any deviation from the horizontal that might manifest itself on the floor of the saloon owing to the rolling of the vessel. A boat, called

the *Bessemer*, was built on this plan in 1875 and put on the cross-Channel service to Calais, but the mechanism of the swinging saloon was not found effective in practice and was ultimately removed. Bessemer's ideas were indeed of very unequal merit, and he must be numbered with those inventors who at more or less frequent intervals have happy thoughts which occasionally prove of real value, rather than with those who set themselves by a patient process of scientific deduction, based on a firm grasp of scientific principle, to discover a means by which an exactly predetermined object may be practically accomplished. He died at Denmark Hill, in the south of London, on 15th March 1898. (H. M. R.)

Best, William Thomas (1826-1897), English organist, was born at Carlisle 13th August 1826. The son of a solicitor, he received his first instruction from Young the cathedral organist; but when he decided to adopt the profession of music, he set to work to teach himself, as the organs of his youth were mostly very incomplete from a modern standpoint, and the admirers of the greatest master of the organ, Sebastian Bach, were very few. He applied himself especially to Bach's music, and became a player of great skill. His successive appointments were to Pembroke chapel, Liverpool, 1840; to a church for the blind, 1847, and the Liverpool Philharmonic Society, 1848. For a short time (1854-55) he was in London, at the Panopticon in Leicester Square, the church of St Martin's-in-the-Fields, and Lincoln's Inn chapel. In 1855 he returned to Liverpool as organist of St George's Hall, where his frequent performances rapidly became famous throughout England. He held other appointments in or near Liverpool, but the post at St George's Hall was the most important. He held this until 1894, when ill-health obliged him to retire. He had been in the receipt of a civil list pension since 1880, and in 1890 went to Sydney to open the organ there. Best died at Liverpool on the 10th of May 1897. He played concertos at many of the Handel Festivals at the Crystal Palace. His playing was always effective and often artistic; though his style in interpreting Bach was not always of the purest, the service he rendered in popularizing the works of that master must be acknowledged. He published a good deal of church music of a more or less popular kind, and issued many arrangements of organ music, editions of Bach, &c. (J. A. F. M.)

Bethel, eleven miles north of Jerusalem, altitude 2880 feet, now Beitân, a small village of about 360 houses. Population, about 2000.

Bethlehem, *i.e.*, "house of bread," probably so called from the fertility of the vicinity, situated on a projecting spur five miles from Jerusalem, altitude 2550 feet. For a description of the church erected by Constantine in 330, see de Vogüé, *Les Églises de la Terre Sainte*. There are several monasteries and convents, and British, French, and German schools. The population, 8000, has contained few Moslems since the Moslem quarter was destroyed by Ibrahim Pasha, after an insurrection in 1834.

Bethlehem, a borough of Northumberland county, Pennsylvania, U.S.A., situated in the eastern part of the state, on the north bank of Lehigh river, opposite South Bethlehem, in 40° 37' N. lat., and 75° 23' W. long. It is a centre for four railways, and has extensive ironworks, the chief industry. A Moravian college and seminary for young women are situated here. Population (1880), 5193; (1900), 7293.

Bethulie. See ORANGE RIVER COLONY.

Béthune, chief town of arrondissement and railway station, department of Pas-de-Calais, France, 18 miles in

direct line N.N.W. of Arras. It is situated in a very productive coal-field. The fortifications of the town are no longer maintained. Port traffic on the Aire Canal in 1898 amounted to 987,157 tons. Population (1881), 9076; (1896), 10,529; (1901), 11,370.

Betterment. See COMPENSATION.

Bettia, a town of British India, in the Champaran district of Bengal; situated in 26° 48' N. lat., and 84° 32' E. long., on the Harha river; station on the Tirhut section of the Bengal and North-Western railway. Population, about 22,000. Bettia is the residence of one of the leading noblemen of Northern Behar, who enjoys a rent-roll of £66,000, and who raised a mortgage loan of £475,000 at 5 per cent. on the London Stock Exchange in 1888. In 1901, owing to a disputed succession, the estate was under the management of the Court of Wards. It comprises land in no less than ten districts, much of which is let on permanent leases to indigo-planters. Besides the palace of the raja, the town contains a middle English school and a female dispensary, entirely supported out of the estate. There is a Roman Catholic mission, with about 1000 converts, which was founded by an Italian priest in 1746.

Betting.—In the early days of horse-racing persons who wished to bet often failed to gratify their inclination because of the difficulty of finding any one ready to wager. To obviate this difficulty the professional bookmaker arose. It was perceived that if a man laid money against a number of horses, conducting his business on discreet principles, he would in all probability receive enough to pay the better who was successful and to leave a surplus for himself; for the "bookmaker," as the professional betting man came to be called, had enormous advantages in his favour. He was presumably shrewd and wary, whereas many of those with whom he dealt were precisely the opposite, and benefit arose to him from the mistakes and miscalculations of owners and trainers of horses, and from the innumerable accidents which occur to prevent anticipated success; moreover, if he carried out the theory of his calling he would so arrange his book, by what is called "betting to figures," that the money he received would be more than he could possibly be called upon to pay. In practice, of course, this often does not happen, because "backers" will sometimes support two or three horses in a race only, and the success of one may result in loss to the bookmaker; but in the long run it has been almost invariably found that the bookmaker grows rich and that the backer of horses loses money. It is the bookmaker who regulates the odds, and this he does, sometimes by anticipating, sometimes by noting, the desire of backers to support certain animals. Such things as stable secrets can scarcely be said to exist at the present time; the bookmaker is usually as well able as any one else to estimate the chances of the various horses engaged in races. Notwithstanding that the reports of a trial gallop are of comparatively little value to any except the few persons who know what weights the animals carried when tried, the bookmaker is extraordinarily keen, and frequently successful, in his search for information; and on this the odds depend.

Betting is of two kinds: "post," when wagering does not begin until the numbers of the runners are hoisted on the board; and "ante-post," when wagering opens weeks or months before the event; though of this latter there is far less than was formerly the case, doubtless for the reason that before the introduction of so many new and valuable stakes attention was generally concentrated on a comparatively small number of races. Bets on the Derby, the Oaks, and the St. Leger were formerly common nearly

a year before the running of the races, and a few handicaps, such as the Chester Cup, used to occupy attention months beforehand; the weights, of course, being published at a much longer interval prior to the contest than is at present the rule. As regards ante-post betting, bookmakers have their own ideas as to the relative prospects of the horses entered. A person who wishes to back a horse asks the price, and accepts or declines, as the case may be. If the bet is laid it will probably be quoted in the newspapers, and other persons who propose to wager on the race are so likely to follow suit that it is shrewdly suspected that in not a few cases bets are quoted which never have been laid, in order to induce the backers to speculate. According to the public demand for a horse the price shortens. If there is little or no demand the odds increase, the market being almost entirely regulated by the money; so that if a great many people bet on a certain animal the odds become shorter and shorter, till in many cases instead of laying odds against a horse, the bookmaker comes to take odds, that is, to agree to pay a smaller sum than he would receive from the backer if the animal lost. Post betting is conducted on very much the same principles. When the numbers are hoisted bookmakers proclaim their readiness to lay or take certain odds, which vary according to the demand for the different animals. Backers are influenced by many considerations: by gossip, by the opinions of writers on racing, and in many cases, unfortunately, by the advice of "tipsters," who by advertisements and circulars profess their ability to indicate winners, a pretence which is obviously absurd, as if these men possessed the knowledge they claim, they would assuredly keep it to themselves and utilize it for their own private purposes.

The specious promises of such men do infinite mischief, as they so often appeal with success to the folly and gullibility of the ignorant, and it is for this reason that a certain amount of sympathy is felt for the endeavours of persons who have entered upon the forlorn hope of endeavouring to prevent betting. A society was formed called the Anti-Gambling League. A bookmaker was summoned for betting in Tattersall's enclosure, which it was contended contravened the Betting House Act of 1853. This Act had been aimed against what were known as "list houses," establishments then kept by bookmakers for betting purposes, and associated with many disgraceful scandals. In the preamble to his Bill Lord Cockburn began by remarking that "Whereas a new form of betting has of late sprung up," and the Anti-Gambling League sought to argue that this included a form of betting which had not sprung up of late but had on the contrary been carried on without interference for many generations. The Divisional Court held that such betting was an infringement of the Act, but ultimately the question came before the House of Lords, and the decision was reversed. The arguments turned almost entirely upon whether such an enclosure was a "place" within the meaning of the Act, and it was finally held that a place did not mean an enclosure in a racecourse, to which many persons, no doubt, did go for the purpose of betting, whilst others went merely with the object of seeing the races. The law with regard to betting is in fact not a little curious. A few years ago two men were imprisoned for introducing a machine similar to the Pari-Mutuels which are recognized and supported by the French Government and by authorities elsewhere, and from which French municipalities derive handsome sums in relief of rates.

Many attempts have been made in France to interfere with the practice of bookmaking and to induce all who desire to wager on horse-races to support the Pari-Mutuels. On all French racecourses, as on others nearly everywhere else on the Continent, and likewise in the Colonies, where

the Pari-Mutuel is called the Totalizator, this system of betting is carried on. Rows of offices are established behind or near the stands, on each of which lists are exhibited containing the numbers of the horses that are to run in the coming race. At some of these the minimum wager is five francs, at others ten, twenty, fifty, one hundred, five hundred, and in some cases a thousand. The person who proposes to bet goes to the clerk at one of these offices, mentions the number, as indicated on the card, of the horse he wishes to back, and states whether he desires to bet on it to win or for a place only. He receives a voucher for his money. After the race the whole amount collected at the various offices is put together and divided, after a percentage has been deducted for the administration and for the poor. As soon as this has been done, the money is divided and the prices to be paid to winners are exhibited on boards. These prices are calculated on a unit of ten francs. Thus, for instance, if the winner is notified as bringing in twenty-five francs, the meaning is that the backer receives his original stake of ten and fifteen in addition, the money being paid immediately by another clerk attached to the office at which the bet was made. (A. E. T. W.)

Betul, a town and district of British India, in the Nabuda division of the Central Provinces. In 1891 the population of the town was 5260. The administrative headquarters of the district have been transferred to the town of Badnur, 5 miles north, which had in 1891 a population of 5014.

The district of BETUL has an area of 3824 square miles. The population in 1891 was 323,116. Classified according to religion, Hindus numbered 197,774; Mahomedans, 5122; aborigines, 119,008, chiefly Gonds; Christians, 66, of whom 21 were Europeans; "others," 1146. In 1901 the population was 285,324, showing a decrease of 12 per cent., due to the results of famine. The total amount of land revenue and rates is returned at Rs.2,02,865, the incidence of assessment being only two annas per acre of assessed area; the number of police was 321. In 1897-98, out of a total cultivated area of 562,069 acres, only 8309 were irrigated from wells. The principal crops are wheat, millet, other food-grains, pulse, oil-seeds, and a little sugar-cane and cotton. A large part of the area (778,976 acres) is still covered with forests, which yield teak and other timber. The only manufacture is cotton cloth. There is no railway, and good roads are few; nor is any of the rivers navigable. In 1897-98 there were 69 schools attended by 3223 pupils. This district suffered very severely from the famine of 1896-97; in 1897 the death-rate being as high as 73 per 1000. It suffered again in 1900, when in May the number of persons relieved rose to one-third of the total population.

Beust, Friederich Ferdinand von (1809-1886), Austrian statesman, was descended from a noble family which had originally sprung from the Mark of Brandenburg, and of which one branch had been for over 300 years settled in Saxony. He was born on 13th January 1809 in Dresden, where his father held office at the Saxon court. After studying at Leipzig and Göttingen he entered the Saxon public service; in 1836 he was made secretary of legation at Berlin, and afterwards held appointments at Paris, Munich, and London. In March 1848 he was summoned to Dresden to take the office of foreign minister, but in consequence of the outbreak of the revolution was not appointed. In May he was appointed Saxon envoy at Berlin, and in February 1849 was again summoned to Dresden, and this time appointed minister of foreign affairs, an office which he continued to hold

till 1866. In addition to this he held the ministry of education and public worship from 1849 to 1853; that of internal affairs in 1853, and in the same year was appointed minister-president. From the time that he entered the ministry he was, however, the leading member of it, and he was chiefly responsible for the events of 1849. By his advice the king refused to accept the constitution proclaimed by the Frankfurt assembly, a policy which led to the outbreak of revolution in Dresden, which was suppressed after four days' fighting by Prussian troops, for whose assistance Beust had asked. On Beust fell also the chief responsibility for governing the country after order was restored, and he was the author of the so-called *coup d'état* of June 1850 by which the new constitution was overthrown. The vigour he showed in repressing all resistance to the Government, especially that of the university, and in reorganizing the police, made him one of the most unpopular men among the Liberals, and his name became synonymous with the worst form of reaction, but it is not clear that the attacks on him were justified. After this he was chiefly occupied with foreign affairs, and he soon became one of the most conspicuous figures in German politics. He was the leader of that party which hoped to maintain the independence of the smaller states, and was the opponent of all attempts on the part of Prussia to attract them into a separate union; in 1849-50 he had been obliged to join the "three kings' union" of Prussia, Hanover, and Saxony, but he was careful to keep open a loophole for withdrawal, of which he speedily availed himself. In the crisis of 1851 Saxony was on the side of Austria, and he supported the restoration of the Diet. In 1854 he took part in the Bamberg conferences, in which the smaller German states claimed the right to direct their own policy independent of that of Austria or of Prussia, and he was the leading supporter of the idea of the *Trias*, i.e., that the smaller states should form a closer union among themselves against the preponderance of the great monarchies. In 1863 he came forward as a warm supporter of the claims of the prince of Augustenburg to Schleswig-Holstein; he was the leader of the party in the German Diet which refused to recognize the Treaty of London, and in 1864 he was appointed representative of the Diet at the Congress of London. He was thus thrown into opposition to the policy of Bismarck, and he was exposed to violent attacks in the Prussian press as a "Particularist," i.e., a supporter of the independence of the smaller states. The expulsion of the Saxon troops from Rendsburg nearly led to a conflict with Prussia. Beust was accused of having brought about the war of 1866, but the responsibility for this must rest with Bismarck. On the outbreak of war Beust accompanied the king to Prague, and thence to Vienna, where they were received by the emperor with the news of Königgrätz. Beust undertook a mission to Paris to procure the help of Napoleon. When the terms of peace were discussed he resigned, for Bismarck refused to negotiate with him.

After the victory of Prussia there was no place for Beust in Germany, and his public career seemed to be closed, but he quite unexpectedly received an invitation from the emperor of Austria to become his foreign minister. It was a bold decision, for Beust was not only a stranger to Austria, but also a Protestant, but the choice of the emperor justified itself. Beust threw himself into his new position with great energy; it was owing to him that the negotiations with Hungary were brought to a successful issue. When difficulties came he went himself to Pesth, and acted directly with the Hungarian leaders. In 1867 he also held the position of Austrian minister-president, and he carried through the measures by which

parliamentary government was restored. He also carried on the negotiations with the pope concerning the repeal of the concordat, and in this matter also did much by a liberal policy to relieve Austria from the pressure of institutions which had checked the development of the country. In 1868, after giving up his post as minister-president, he was appointed chancellor of the empire, and received the title of count. His conduct of foreign affairs, especially in the matter of the Balkan states and Crete, successfully maintained the position of the empire. In 1869 he accompanied the emperor on his expedition to the East. He was still to some extent influenced by the anti-Prussian feeling he had brought from Saxony. He maintained a close understanding with France, and there can be little doubt that he would have welcomed an opportunity in his new position of another struggle with his old rival Bismarck. In 1867, however, he helped to bring the affair of Luxemburg to a peaceful termination. In 1870 he did not disguise his sympathy for France, and the failure of all attempts to bring about an intervention of the Powers, joined to the action of Russia in denouncing the Treaty of Paris, was the occasion of his celebrated saying that he was nowhere able to find Europe. After the war was over he completely accepted the new organization of Germany, and in a meeting with Bismarck at Gastein laid the foundation for the good understanding between Austria and Germany. In 1871 he interfered at the last moment, together with Andrassy, to prevent the emperor accepting the federalist plans of Hohenwart. He was successful, but at the same time he was dismissed from office. The precise cause for this is not known, and no reason was given him.

At Beust's own request he was appointed Austrian ambassador at London; in 1878 he was transferred to Paris; in 1882 he retired from public life. He died at his villa at Altenberg, near Vienna, on the 24th of October 1886, leaving two sons, who hold positions in the Austrian diplomatic service. His wife, a Bavarian lady, survived him only a few weeks. His elder brother Friederich Constantine, who was at the head of the Saxon department for mines, was the author of several works on mining and geology, a subject in which other members of the family had distinguished themselves.

Beust was in many ways a diplomatist of the old school. He had great social gifts and personal graces; he was proud of his proficiency in the lighter arts of composing waltzes and *vers de société*. His chief fault was vanity, but it was an amiable weakness. It was more vanity than rancour which made him glad to appear even in later years as the great opponent of Bismarck; and if he cared too much for popularity, and was very sensitive to neglect, the saying attributed to Bismarck, that if his vanity was taken away there would be nothing left, is very unjust. He was apt to look more to the form than the substance, and attached too much importance to the verbal victory of a well-written despatch; but when the opportunity was given him he showed higher qualities. In the crisis of 1849 he displayed considerable courage, and never lost his judgment even in personal danger. If he was defeated in his German policy, it must be remembered that Bismarck held all the good cards, and in 1866 Saxony was the only one of the smaller states which entered on the war with an army properly equipped and ready at the moment. That he was no mere reactionary the whole course of his government in Saxony, and still more in Austria, shows. His Austrian policy has been much criticized, on the ground that in establishing the system of dualism he gave too much to Hungary, and did not really understand Austrian affairs. This is probably true, but it remains the fact that in a crisis of

extraordinary difficulty he carried to a successful conclusion a policy which, even if it was not the best imaginable, was probably the best attainable in the circumstances, and it is difficult to name any statesman of the century to whom Austria has more real ground for gratitude.

Beust was the author of reminiscences: *Aus drei Viertel-Jahrhunderten*, 2 vols. Stuttgart, 1887.—An English translation was edited by Baron H. de Worms; and he also wrote a shorter work, *Erinnerungen zu Erinnerungen*, Leipzig, 1881, in answer to attacks made on him by his former colleague, Herr v. Frieser, in his reminiscences. See also EBELING. *F. F. Graf v. Beust*. Leipzig, 1876. A full and careful account of his political career, especially up to 1866.—*Diplomatic Sketches: No. 1, Count Beust*. By OUTSIDER (Baron Carl v. Malortie).—FLATHE. *Geschichte von Sachsen*, vol. iii. Gotha, 1877.—FRIESÉN. *Erinnerungen aus meinem Leben*. Dresden, 1880. (J. W. HE.)

Beuthen, a mining town of Prussia, province of Silesia, 121 miles by rail S.E. from Breslau. It is the centre of coal and zinc mines, iron and zinc smelting, steam planing and saw milling. Population (1885), 30,602; (1900), 51,500.

Beveren, a town of Belgium, in the province of East Flanders, 29 miles N.E. of Ghent by rail. It has numerous breweries and manufactures of lace and cigars. Population (1880), 7838; (1897), 9104.

Beverley, an ancient municipal borough and a market town in the Holderness parliamentary division of Yorkshire, England, 8 miles N.N.W. of Hull by rail. Since 1889 it has been the seat of a suffragan bishopric. Amongst its public buildings are the minster and the parish church of St Mary's, two of the finest examples of Early English architecture, various Nonconformist chapels, a cottage hospital, waterworks, and (under one building) a corn exchange, butter market, and swimming baths. Its staple trades are tanning, the manufacture of agricultural implements, wood-carving, and matting. It possesses communication with the port of Hull by water, and thence to all parts. The corporation own the gasworks and the electric lighting works. The borough comprises three parishes, with a total area of 2411 acres of common pasture land. Population (1881), 11,425; (1901), 13,183.

Beverly, a seaboard city of Essex county, in Eastern Massachusetts, U.S.A., situated on the north shore of Massachusetts Bay, opposite Salem, and 17 miles N.E. of Boston. The principal village, of the same name, is on the Boston and Maine railway. Beverly received a city charter in 1893. Population (1880), 8456; (1900), 13,884.

Bexley, a large parish, urban district, and village, in the Dartford parliamentary division of Kent, England, 12 miles from London by rail. The urban district includes Bexley Heath, with Welling, and Lamorbey or Halfway Street, and has an area of 5328 acres. Population (1891), 10,605; (1901), over 12,000.

Bezae Codex. See CODEX BEZAE.

Béziers, chief town of arrondissement, department of Hérault, France, 45 miles W.S.W. of Montpellier, on railway to Narbonne. The Allées Paul Riquet is a handsome promenade adorned with a statue of Riquet. The Canal du Midi here crosses the Orbe by a fine bridge-aqueduct, and about half-a-mile from the town are the large locks of Fonserannes, in which the water is raised 80 feet in 330 yards to the level of the Orb. The distilling of brandy has far outdistanced all other industries, and most of the manufactures of the town are more or less connected with the trade. Population (1881), 37,824; (1896), 41,706, (comm.) 45,260; (1901), 52,310.

Bezwada, a town of British India, in the Kistna district of Madras, on the left bank of the river Kistna, at the head of its delta; population, about 20,000. The

municipal income in 1897-98 was Rs.46,280. Here are the headquarters of the Kistna canal system, which irrigates more than 500,000 acres, and also provides navigation throughout the delta. The anicut or dam at Bezpada, begun in 1852, consists of a mass of rubble, fronted with masonry, 1240 yards long. Here also is the central junction of the East Coast railway from Madras to Calcutta, 267 miles from Madras, where one branch line comes down from the Warangal coalfield in the Nizam's dominions, and another from Bellary on the Southern Mahratta line. It is proposed to construct a third branch to Masulipatam on the coast. There are a Church Mission and high schools.

Bhagalpur, a city of British India, in the Behar province of Bengal, which gives its name to a district and to a division; situated on the right bank of the Ganges, 265 miles from Calcutta. It is a station on the East Indian railway. Population (1881), 68,238; (1891), 69,106; (1901), 75,273, showing an increase of 9 per cent. The chief educational institution is the Tejnarayan Jubilee College, supported almost entirely by fees. The English high school had 335 pupils in 1897, and there are four printing-presses.

The district of BHAGALPUR stretches across both banks of the Ganges. It has an area of 4226 square miles. Population (1881), 1,967,635; (1891), 2,032,694, showing an increase of 3 per cent.; average density, 481 persons per square mile. Classified according to religion, Hindus numbered 1,811,359; Mahommedans, 195,591; aborigines, 24,740; Christians, 534, of whom 140 were Europeans; "others," 470. In 1901 the population was 2,088,565, showing a further increase of 3 per cent. The land revenue and rates in 1897-98 were Rs.7,60,266, and number of police was 473. There were 23,437 boys at school in 1896-97. The registered death-rate (1897) was 30 per 1000. There are 17 indigo factories, employing about 7000 persons, with an out-turn valued at Rs.2,82,000. Other industries include the weaving of tusser silk and the making of coarse glass. A large trade is carried on by rail and river with Lower Bengal. The tract south of the Ganges is traversed by the loop-line of the East Indian railway, and a railway across the northern tract was, in 1901, under construction.

The division of BHAGALPUR stretches across the Ganges from the Nepal frontier to the hills of Chota Nagpur. It comprises the five districts of Monghyr, Bhagalpur, Purneha, Malda, and the Sonthal Parganas. The total area covers 20,511 square miles; and in 1891 the population was 8,582,490, being an average of 418 persons per square mile; the land revenue and rates in 1897-98 were Rs.38,76,545; the number of police was 2196. In 1896-97 the total number of schools was 5432, attended by 113,240 pupils, of whom 7418 were girls.

Bhamo, in ancient times the capital of the Shan state of Manmaw, later the seat of a Burmese governor, now the headquarters of a district in the northern division of Upper Burma (Chinese frontier). It lies wholly in the basin of the Irrawaddy, which, as well as its tributaries, runs through the heart of it. On the east is the river of the Shan plateau, running almost due north and south. West of the Irrawaddy there is a regular series of ranges, enclosing the basins of the Kaukkwè, Mosit, Indaw, and other streams, down which much timber is floated. Beyond the Kaukkwè there is a ridge of hills, which starts at Leka, near Mogaung, and diverges to the south, the eastern ridge dividing the Kaukkwè from the Mosit, and the western forming the eastern watershed of the Nam Yin and running south into Katha. It is an offshoot from the latter of these ridges that forms the third defile

of the Irrawaddy between Bhamo and Sinbo. The district covers an area of 9800 square miles, and the population in 1891 was 54,200, but this must now be much below the real number. It is mainly composed of Shan-Burmese and Kachins. The Shan-Burmese inhabit the valleys and alluvial plains on each side of the river. The Kachins, who probably came from the sub-regions of the Himalayas, occupy the hills throughout the district. There are also settlements of Shans, Shan-Chinese, Chinese and Assamese. There are extensive fisheries in the Shwegu and Mo-hnyin circles, and in the Indaw, a chain of lakes just behind the Mosit, opposite Shwegu. These yield Rs.13,000 rental a year. The district abounds in rich teak forests, and there are reserves representing 60,000 acres of teak plantation. Contracts and licenses were issued in 1897 for nearly 26,000 logs. The whole of the country along the banks of the Irrawaddy, the Molè, Taping Sinkan, and Kaukkwè, is generally in a water-logged condition during the rains. The climate in the district is therefore decidedly malarious, especially at the beginning and end of the rains. From November to March there is very bracing cold weather. The highest temperatures range a few degrees over 100° F. up to 106°, and the lowest a few degrees under 40°. The average maximum for the year is about 87°, the average minimum about 62°. The rainfall averages 72 inches a year.

BHAMO, the headquarters of the district, is situated in 24° 16' N. lat. In 1891 it contained 5798 inhabitants, of whom a considerable number were Chinamen, natives of India, and Shan Chinese. It stretches for a distance of nearly four miles along the Irrawaddy bank in a series of small villages, transformed into quarters of the town, but the town proper is confined mainly to the one high ridge of land running at right angles to the river. The surface of the ground is much cut up by ravines which fill and dry up according to the rise and fall of the river. When the Irrawaddy is at its height the lower portion of the town is flooded, and the country all round is a sheet of water, but usually for no very long time. Here or hereabouts has long been the terminus of a great deal of the land commerce from China. Until some years after the annexation, however, the trade routes were very unsafe owing to attacks from the Kachins. These have now quite ceased, and the roads, which were mere bridle-tracks, have been greatly improved. The two chief are the so-called Santa and Ponlaing route, through Manyin (Manwaing) and Nantien to T'engyüeh, and the southern or Sawadi route by way of Namhkam. Cart roads are now being constructed on both routes, and that south of the Taping river could easily be continued through Manyin to T'engyüeh if the Chinese should be induced to co-operate. A railway to T'engyüeh is quite feasible and would doubtless be profitable, but it would never serve a large area of country, could not be prolonged beyond T'engyüeh, and would be greatly inferior to the route by the Kun-long ferry. There is a fairly large military garrison in Bhamo distributed between two forts to the north and east of the town. There are in general stationed here a native regiment, two sections of a battery, and the wing of a European regiment. Besides the barracks there are a circuit house, dāk bungalow, courthouse, and post and telegraph offices. There is daily steamer communication, either direct to Mandalay or to the terminus of the railway at Katha, by the vessels of the Irrawaddy Flotilla Company. (J. G. Sc.)

Bhandara, a town and district of British India, in the Nagpur division of the Central Provinces. The town (population about 13,000) is situated on the left bank of the river Wainganga, six miles from a station on the Bengal-Nagpur railway. It has considerable manufactures of cotton cloth and brass-ware, and a first-grade middle school, with a library. The average death-rate for five years is 28 per thousand.

The district of BHANDARA has an area of 3968 square miles. The population in 1891 was 742,850, being 187 persons per square mile. Classified according to religion, Hindus numbered 639,994; Mahommedans, 13,100; aborigines, 89,179, chiefly Gonds; Christians, 121, of whom 13 were Europeans; "others," 456. In 1901 the population was 663,578, showing a decrease of 11 per cent., compared with an increase of 8 per cent. in the

preceding decade. The total amount of land revenue and rates is returned as Rs.4,74,385, the incidence of assessment being Rs.0:5:3 per acre of assessed area ; number of police, 237. In 1897-98, out of a total cultivated area of 796,618 acres, 195,416 were irrigated from tanks, &c. The principal crops are rice, wheat, millet, other food-grains, pulse, linseed, and a little sugar-cane. The district is traversed by the main road from Nagpur to the east, and also by the Bengal-Nagpur railway. The number of schools is 152, attended by 7802 pupils. The average death-rate for five years is 32 per thousand. Bhandara suffered in the famine of 1896-97, and yet more severely in 1900.

Bharatpur, or BHURTPUR, a native state of India, in the Rajputana Agency. Its area covers 1961 square miles. In 1881 it had a population of 645,540, and in 1891 of 640,303, giving an average density of 327 persons per square mile. In 1901 the population was 626,120, a decrease of 2 per cent. The estimated gross revenue was Rs.27,00,000; the expenditure on public works in 1897-98 was Rs.5,52,420, of which Rs.1,88,780 was devoted to irrigation; the number of schools was 89, with 6248 pupils; the number of hospitals and dispensaries was 77, attended by 116,228 patients. The present Maharaja, Raghunath Sing, was placed on the throne in 1895, in supersession of his elder brother, who was found unfit. During his minority the administration has been conducted by a native minister, together with a state council, under the general superintendence of the political agent. Imperial service cavalry are maintained. The state is traversed for about 40 miles by the Rajputana railway.

The city of BHARATPUR is 34 miles west of Agra by rail. The population in 1881 was 66,163; in 1891 it was 68,033. The immense mud ramparts still stand. It has a handsome palace, a new hospital, and a high school, with 144 pupils learning English. There are special manufactures of *chauris*, or flappers, with handles of sandalwood, ivory, or silver, and tails also made of strips of ivory or sandalwood as fine as horse-hair.

Bhau Daji (RAMKRISHNA VITHAL) (1822-1874), Hindu physician of Bombay, Sanskrit scholar and antiquary, born in 1822 at the village of Manjare, in the native state of Savantwudi, of humble parents, dealing in clay dolls. Dr. Bhau's career is a striking instance of great results arising from small accidents. An Englishman noticing his cleverness at chess induced his father to give the boy an English education. Accordingly Bhau was brought to Bombay and was educated at the Elphinstone Institution, under Harkness, Bell, and Henderson. He relieved his father of the cost of his education by winning many prizes and scholarships, and on his father's death two years later he cheerfully undertook the burden of supporting his mother and a brother (NARAYEN), who also in after-life became a distinguished physician and surgeon. About this time he gained a prize for an essay on Infanticide, and was appointed a teacher in the Elphinstone Institution. He began to devote his time to the study of Indian antiquities, deciphering inscriptions and ascertaining the dates and history of ancient Sanskrit authors. He then studied at the Grant Medical College, under Morehead, Ballingall, and Giraud, and was one of the first batch who graduated there in 1845. In 1851 he set up as a medical practitioner in Bombay, where his success was so great that he soon made a fortune. He studied the Sanskrit literature of medicine, and also tested the value of drugs to which the ancient Hindus ascribed marvellous powers, among other pathological subjects of historical interest investigating that of leprosy. He was an ardent promoter of education. He was appointed a member of the Board of Education, and was one of the

original fellows of the University of Bombay. As the first native president of the Students' Literary and Scientific Society, and the champion of the cause of female education, a girls' school was founded in his name, for which an endowment was provided by his friends and admirers. In the political progress of India he took a great and active interest, and the Bombay Association, and the Bombay Branch of the East Indian Association owe their existence to his ability and exertions. He was twice chosen Sheriff of Bombay, in 1869 and 1871. Various scientific societies in England, France, Germany, and America conferred on him their membership. He contributed numerous papers to the journal of the Bombay branch of the Royal Asiatic Society. He found time to make a large collection of rare ancient Sanskrit manuscripts at great cost and trouble. But his career was cut short by a sudden stroke of paralysis, to which he succumbed in May 1874. His brother, Dr. Narayen Daji (who helped him to set up the charitable dispensary in Bombay), did not long survive him. Dr. Bhau was a man of the most simple and amiable character and manners; his kindness and sympathy towards the poor and distressed were unbounded, and will ever embalm and endear his memory among the Hindus of Bombay. (N. B. W.)

Bhaunagar, or BHAVNAGAR, a native state of India, in Kathiawar, within the Gujarat division of Bombay. Its area covers 2860 square miles; in 1881 the population was 400,323, and in 1891 it was 464,671. The estimated gross revenue in 1897-98 was Rs.38,27,740, of which Rs.9,22,810 was expended on public works, and Rs.2,82,000 on famine relief; the tribute was Rs.1,54,490. The chief, whose title is Thakor Saheb, is a Gohel Rajput. He was educated at the Rajkumar College at Rajkot, and has visited England. The system of administration, formed during his minority, has been continued with admirable results under his personal supervision, and forms a model for other native states. Bhaunagar suffered terribly from the famine of 1899-1900. About 60 miles of the Bhaunagar-Gondal railway run through the state, with its terminus at the town of Bhaunagar, which is the principal port. The town of BHAUNAGAR is situated in 21° 45' N. lat. and 72° 12' E. long., on the west coast of the Gulf of Cambay. The population in 1881 was 47,792; in 1891 it was 57,653. It is now the chief port in Kathiawar, though only admitting vessels of small burden. There is a cotton mill, with 208 looms and 12,000 spindles; several steam presses and ginning factories; an arts college, with 102 students in 1896-97; a high school, with 384 pupils; a school for girls, entirely supported by the state; and a state printing-press.

Bhera, a town of British India, in the Shahpur district of the Punjab, situated in 32° 29' N. lat. and 72° 57' E. long., on the river Jhelum. It is the terminus of a branch of the North-Western railway. In 1881 it had a population of 15,165; and in 1891 of 17,428; the municipal income in 1897-98 was Rs.19,419. It is an important centre of trade, with manufactures of cotton goods, metal-work, carving, &c. It has two high schools, municipal and Anglo-Sanskrit, and a printing-press, issuing a newspaper.

Bhiwani, a town of British India, in the Hissar district of the Punjab, 38 miles south-east of Hissar town by rail. The population in 1881 was 33,762; in 1891 it was 35,487; the municipal income in 1897-98 was Rs.50,042. It is an important centre of trade with Rajputana, and has three factories for ginning and pressing cotton. It has a Baptist mission and a municipal school.

Bhopal, a native state of India, in the Central India agency, has an area of 6874 square miles. In 1881 it had a population of 954,901; and in 1891 of 952,486, giving an average density of 138 persons per square mile. The estimated revenue is Rs.40,00,000, and it pays a subsidy of Rs.2,00,000 for the Bhopal battalion. For three generations the ruler has been a woman. Sultan Shah Begum succeeded on the death of her mother in June 1901. Besides the Bhopal battalion, a regiment of imperial service cavalry is maintained, under the name of the Victoria Lancers. There is a branch railway from Itarsi to Bhopal city, continued to Jhansi. The British currency has been introduced, and in 1897-98, Rs.71,00,000 of Bhopali coins were converted. The residence of the political agent and the headquarters of the Bhopal battalion are at Sehore, 20 miles west of Bhopal city. The city of BHOPAL, a railway station, had a population in 1881 of 55,402; and in 1891, of 70,338. The palace, with its rock fortress, is called Fatehgarh. An excellent water-supply has been provided from two large artificial lakes. There are two hospitals. In 1897-98 the exports of opium were 678 chests, paying a duty of Rs.3,67,500. The state suffered very severely from famine in 1899-1900. The preliminary returns of the census of 1901 showed a decrease of no less than 40 per cent. in the population of the Bhopal agency, which is not co-extensive with the state of Bhopal.

Bhor, a native state of India, in the Deccan division of Bombay, forming one of the Satara Jagirs; situated among the higher peaks of the Western Ghats. Its area covers 1491 square miles. The population in 1881 was 145,876; in 1891 it was 155,659, giving an average density of 104 persons per square mile; and in 1901 it was 137,269, showing a decrease of 12 per cent.; the estimated gross revenue is Rs.4,30,528; the tribute, Rs.4643; the military force numbers 117 men; the number of schools is 35, with 1328 pupils. The chief, whose title is Pant Sachiv, is a Brahman by caste. The town of BHOR is situated in 18° 9' N. lat. and 73° 53' E. long., 25 miles south of Poona. In 1891 the population was 5250. There is a state printing press. The Bhor Ghat, on the northern border of the state, has always been the main pass over the Western Ghats, or means of communication between the sea-coast and the Deccan. Since 1861 it has been traversed by the main line of the Great Indian Peninsula railway.

Bhuj, a town of India, the capital of the native state of Cutch, in the Gujarat division of Bombay, is situated in 23° 15' N. lat. and 69° 48' E. long., at the base of a fortified hill. In 1881 it had a population of 22,308, and in 1891 of 25,421. It contains some interesting examples of architecture; a high school, with 131 pupils in 1896-97; a school of art; a library; and a state printing press.

Bhutan, a country of the eastern Himalaya, between the Brahmaputra and the southern face of the mountains. Information respecting it accumulates but slowly. In 1873, Captain Godwin Austen accompanied Sir Ashley Eden's mission to the court of the Deb Raja, and made a survey of the route to Punaka. There has also been a certain amount of geographical sketching combined with trigonometrical observations; and there are the route surveys of native explorers. In 1887-88 two native Indian explorers "R. N." and "P. A." traversed a part of Western Bhutan, but were forced to retire owing to the disturbed state of the districts. They re-entered the country on the east from Dewangiri. Here they explored the Kuru, or Lhobrak Chu, which proves to be the largest river in Bhutan. It drains the tract between

the Yamdok Tso and Tigu Lakes, and is fed by the glaciers of the Kulha Kangri and other great ranges. The Lhobrak was finally identified with the Monás river, a geographical discovery of some importance. A previously unknown tribe, the Chingmis, were discovered in Eastern Bhutan, who are socially on a higher level than the Bhutias, and differ from them chiefly in the matter of wearing pigtails. The Monla Kachung pass (17,500 feet), by which "R. N." crossed into Tibet, is nearly on the meridian of Gualpara, and is one of the most important passes between Bhutan and Tibet. East of Bhutan, amongst the semi-independent hill states which sometimes own allegiance to Tibet and sometimes assert complete freedom from all authority, the geographical puzzle of the course of the Sangpo, the great river of Tibet, has been solved by the researches of Captain Harman, and the explorations of the native surveyor "K. P." The Sangpo has been definitely ascertained to be the same river as the Brahmaputra. The tracts inhabited by the aboriginal tribes entitled Lo Nakpo, Lo Karpo, and Lo Tawa ("Lo" signifies "barbarous" in Tibetan), are described as a pleasant country; the lands on either side of the Sangpo being well cultivated and planted with mangoes, plantains, and oranges.

Nothing is known with certainty about the area and population of Bhutan, the former being estimated at 16,800 square miles. The government is nominally vested in a temporal and a spiritual sovereign known as the Deb Raja and the Dharm Raja. Recently official correspondence has been written in the name of the latter instead of the former, but it is not known whether this change possesses any special significance. The people are Buddhists in religion. Trade between Bhutan and Bengal is registered at stations in Jalpaiguri district. In 1897-98 the exports were valued at Rs.1,08,000, chiefly wax, musk, wool, ponies, cattle, fruit and vegetables; the imports were valued at Rs.1,37,000, chiefly cotton piece goods, betel nuts, tobacco, rice, and metals. Some trade is also conducted at fairs on the Assam frontier.

Report on Explorations in Sikkim, Bhutan, and Tibet. Deva Dun, 1889.—TANNER. "Our present Knowledge of the Himalayas," *R. G. S. Proceedings*, vol. xiii. (T. H. H.)*

Biala, the chief town of a government-district in Galicia, Austria, opposite Bielitz, on the river Biala, which at this point forms the boundary between Galicia and Austrian Silesia. It is the chief seat of the Galician textile industry, and an important market for pigs. Population (1890), 7622 (of whom 5493 were Germans); (1900), 8265.

Biancavilla, a town of the province of Catania, Sicily, Italy, situated at the S.W. foot of Mount Etna, 19 miles N.W. from Catania by rail. It is famous for its oranges, and has flour mills. An Albanian colony was settled here in 1480. Population, about 13,500.

Biarritz, a seaside resort of France, department of Basses-Pyrénées, in the arrondissement of Bayonne, 61 miles in direct line W. by N. of Pau, on the railway from Paris *viâ* Bordeaux and Bayonne. Its present popularity is chiefly due to its having been a favourite place of sojourn of the Emperor Napoleon III. and the Empress Eugénie. The town extends in irregular form for nearly two miles along the rugged coast. It is entirely modern, and the chief feature is the casino, finished in 1901. There is an English season early in the year, a Spanish season in the summer, and a Russian season in the autumn. It is connected with Bayonne by a local railway and a tramway. Population (1881), 6488; (1896), 10,544, (comm.) 11,869; (1901), 12,812.

Biberach, a town of Würtemberg, Germany, 23 S. II. — 31

miles S.S.W. from Ulm. A monument to the poet Wieland, born near here in 1733 (died 1813), was put up in 1881. Biberach has various textile industries, and manufactures of toys and zinc wares; bell-casting; and its fruit markets are famous. Population (1900), 8390.

Bicycle. See CYCLING.

Biddeford, a city of York county, Maine, U.S.A., situated in the south-western part of the state, in 43° 30' N. lat. and 70° 27' W. long., on the west bank of the Saco river, which is here not navigable. It is supplied with water from the Saco, and a fall in the river at this point affords excellent water-power, which has been utilized to a great extent, principally in the manufacture of cotton goods, in which Biddeford holds high rank. It is on two branches of the Boston and Maine railway. Population (1880), 12,651; (1890), 14,443; (1900), 16,145.

Bidder, George Parker (1806-1878), English engineer, was born at Moreton Hampstead, in Devonshire, on 14th June 1806. From a very early age he manifested an extraordinary natural aptitude for calculation, which induced his father, who was a stone-mason, to exhibit him as a "calculating boy." In this way his talent was turned to profitable account, but his general education was in danger of being completely neglected. Interest, however, was taken in him by some of those who happened to witness his performances, among them being Sir John Herschel, and it was arranged that he should be sent to a school in Camberwell. There he did not remain long, being removed by his father, who wished to exhibit him again, but he was saved from this misfortune and enabled to attend classes at Edinburgh University, largely through the kindness of Sir Henry Jardine, to whom he subsequently showed his gratitude by founding a "Jardine Bursary" at the university. On leaving college in 1824 he received a post in the Ordnance Survey, but gradually drifted into engineering work. In 1834 Robert Stephenson, whose acquaintance he had made at Edinburgh, offered him an appointment on the London and Birmingham railway, and in the succeeding year or two he began to assist George Stephenson in his parliamentary work, which at that time included schemes for railways between London and Brighton and between Manchester and Rugby *via* the Potteries. In this way he was introduced to engineering and parliamentary practice at a period of great activity which saw the establishment of the main features and principles that have since governed English railway construction. He is said to have been the best witness that ever entered a committee-room. He was quick to discover and take advantage of the weak points in an opponent's case, and his powers of mental calculation frequently stood him in good stead, as when, for example, an apparently casual glance at the plans of a railway enabled him to point out errors in the engineering data that were sufficient to secure rejection of the scheme to which he was opposed. In consequence there was scarcely an engineering proposal of any importance brought before Parliament in connexion with which his services were not secured by one party or the other. On the constructive side of his profession he was also busily occupied. In 1837 he was engaged with R. Stephenson in building the Blackwall railway, and it was he who designed the peculiar method of disconnecting a carriage at each station while the rest of the train went on without stopping, which was employed in the early days of that line when it was worked by means of a cable. Another series of railways with which he had much to do were those in the eastern counties which afterwards became the Great Eastern system. Nor was his practice confined to England. He advised on the construction of the Belgian railways; with R. Stephenson he made the first

railway in Norway, from Christiania to Eidsvold; he was engineer-in-chief of the Royal Danish railway; and he was largely concerned with railways in India, where he strongly and successfully opposed break of gauge on through-routes. But though he sometimes spoke of himself as a mere "railway engineer," he was in reality very much more; there was indeed no branch of engineering in which he did not take an interest, as was shown by the assiduity with which for half a century he attended the weekly meetings of the Institution of Civil Engineers and joined in the discussions. He was one of the first to recognize the value of the electric telegraph. That invention was in its infancy when, in 1837, jointly with R. Stephenson he recommended its introduction on a portion of the London and Birmingham and on the Blackwall lines, while three years later he advised that it should be adopted to facilitate the working of the single line between Norwich and Yarmouth. It was he, too, who persuaded Cooke, Stephenson, and others to join him in founding the Electric Telegraph Company, which enabled the public generally to enjoy the benefits of telegraphic communication. In hydraulic engineering, he was the designer of the Victoria Docks (London), being responsible not only for their construction, but also for what was regarded by some people at the time as the foolish idea of utilizing the Essex marshes for dock accommodation on a large scale. It may be mentioned, too, that he was one of the engineers consulted in regard to the London main drainage scheme, and the Government of the day frequently sought his advice on points both of naval and military engineering. He died at Dartmouth, 28th September 1878, retaining his remarkable powers of calculation down to the very end of his life. (H. M. R.)

Bideford, a municipal borough and market town in the Barnstaple parliamentary division of Devonshire, England, on the Torridge, 9 miles S.W. of Barnstaple by rail. The customs port of Bideford was in 1882 included in the port of Barnstaple. Recent structures are an Anglican, a Wesleyan Methodist, and a Roman Catholic church, a public hall, the post office, market buildings, an infirmary, and new buildings for the municipal, science, art, and technical schools. The water-works have been extended. Shipbuilding has ceased, but there are now extensive cuff and collar manufactures, a foundry, and a pottery. Area, 3398 acres; population (1881), 6512; (1901), 8732.

Biebrich, a town of Prussia, province of Hesse-Nassau, on the right bank of the Rhine, 3 miles S. from Wiesbaden, of which it serves as the river port. It has a non-commissioned officers' school, and a castle of the grand-duke of Luxemburg (1704-6). There are ironworks, and also cement, artificial wool, and other manufactures. Population, inclusive of the adjacent Mosbach, (1885), 9669; (1895), 12,292; (1900), 15,048.

Biel or **BIENNE**, a town in the Swiss Canton of Bern, near the north end of the lake of the same name, and 21 miles by rail from Bern. The parish church of St. Benedict was founded in 1451, and contains some good painted glass, dated 1457. In the town is the important Schwab Museum, containing many prehistoric and Roman antiquities. At Biel is the technical school for West Switzerland, as well as schools for watchmaking and railway science, the town being an important railway centre. There is a funicular railway from the town north-west up to the hill of Magglingen or Macolin. Population (1880), 11,613; (1888), 15,289; (1900), 21,958. In 1888 it numbered 12,782 Protestants and 2176 Romanists, while 10,505 were German-speaking, and 4597 French-speaking.

Bielefeld, a town of Prussia, province of Westphalia,

68 miles by rail S.W. from Hanover. It is the chief centre of the linen industry of Westphalia, and an important seat for the manufacture of plush, silk, and hosiery, and for bleaching. The old fort of Sparenberg was burnt down in 1877, but rebuilt. Population (1885), 34,931; (1900), 62,464.

Bielitz (Bohemian or Czech, *Bilsko*; Polish, *Bielsko*), chief town of district of the same name in Austrian Silesia. In 1890 the population of the district, a German enclave, was 71,333, of whom 43,350 were Catholic, 26,663 Protestant, and 1320 Jews; in 1900, 75,425. Population of town (1890), 14,573; (1900), 16,885. It has important woollen and linen industry, and manufactures of jute, paper, machinery, &c.

Biella, a town and episcopal see of the province of Novara, Piedmont, Italy, on the N.W. edge of the valley of the Po, 30 miles by rail N.W. from Vercelli. It has statues to General Lamarmora, Garibaldi, and Sella (mineralogist, died 1884). Biella is the seat of very considerable woollen, cotton, and clothing manufactures, also ironworks and foundries, tanneries, sawmills, turnery shops, and hat factories. It has a technical school. Population about 15,000. In the neighbourhood are several hydropathic establishments, e.g., Oropa, Cossilla, &c.

Bigelow, John (1817—), American journalist and diplomat, was born at Malden, New York, 25th November 1817. He graduated at Union College, 1835; was a practising lawyer in New York several years after 1839; took up journalistic work, becoming joint-owner (with William Cullen Bryant) and managing editor of the New York *Evening Post* (1849-61); was United States consul at Paris, 1861-64, and minister to France, 1864-67, and was secretary of state for the state of New York, 1875-77. He wrote books of travel, of popular biography, or of historical or political discussion, &c., from time to time; but his principal literary achievements were editions, between 1868 and 1888, of Franklin's autobiography and autobiographical writings, copiously annotated; and of the complete works of Franklin, in ten octavo volumes (New York, 1887-89). These editions were based, in part, upon the editor's personal investigations of manuscript sources in France and elsewhere, and supplanted the well-known, long serviceable, but less accurate edition by Jared Sparks (Boston, 1836-40). Mr. Bigelow was a close friend of Samuel J. Tilden, and became his literary executor, editing a two-volume collection of his speeches and other political writings, issued in 1885. As regards its unity of plan and symmetry of literary execution, Mr. Bigelow's most noteworthy book is a brief biography of his editorial associate William Cullen Bryant (1890).

Big Rapids, capital of Mecosta county, Michigan, U.S.A., situated on Muskegon river, in the central part of the lower peninsula. Population (1900), 4686.

Bijapur, an ancient city and modern district of British India, in the Carnatic or Canarese-speaking division of Bombay. The city was made the administrative headquarters of the district in 1885; it is a station on the Southern Mahratta railway, 60 miles south of Sholapur. The population in 1881 was 11,424; in 1891 it was 16,759. The water-supply is derived from an elaborate system of reservoirs and aqueducts, which was restored in part as a famine relief work. Bijapur is probably the most picturesque collection of ruins in all India.

The district of BIJAPUR, formerly called Kaladgi, occupies a barren plain, sloping eastward from a string of feudatory Mahratta states to the Nizam's dominions. It contains an area of 5668 square miles. The population

in 1891 was 796,339, being 140 persons per square mile. Classified according to religion, Hindus numbered 703,604; Mahommedans, 88,522; Jains, 3353; Christians, 827, of whom 42 were Europeans; "others," 33. In 1901 the population was 735,041, showing a decrease of 8 per cent., compared with an increase of 27 per cent. in the preceding decade, and a decrease of 21 per cent. in the period between 1872 and 1881. These changes in population reveal the effects of famine, which was very severely felt in 1876-78, and again in 1899-1900. The total amount of land revenue and rates was returned as Rs.18,52,507, the incidence of assessment being about eight annas per acre; the number of police was 684. In 1897-98, out of a total cultivated area of 2,608,290 acres, only 15,972 were irrigated from tanks, &c. The principal crops are millet, wheat, pulse, oil-seeds, and cotton. There are considerable manufactures of cotton and silk goods and blankets, and eight factories for ginning and pressing cotton. The East Deccan line of the Southern Mahratta railway traverses the district from north to south. In 1897-98 there were 313 schools with 15,081 pupils, showing one village with a school to 23 square miles of area, and 1.9 pupils to every hundred of the population. There were four printing presses, each issuing a weekly newspaper in the vernacular. The municipalities had a total income of Rs.72,956, the incidence of taxation being 14 annas per head. The death-rate in 1897 was 46 per thousand for the district, rising to 50 for the city.

Bijawar, a native state of India, in the Bundelkhand agency. Area, 974 square miles; population (1891), 123,414; average density, 127 persons per square mile; revenue (1897-98), Rs.1,53,757. The chief, whose title is Maharaja, is a Rajput of the Bundela clan, descended from Chhatar Sal, the champion of the independence of Bundelkhand in the 18th century. In 1901 the state was under British administration. The town of Bijawar is situated in 24° 37' N. lat. and 79° 31' E. long.

Bijnor, or BIJNAUR, a town and district of British India, in the Rohilkhand division of the North-West Provinces. The town is about three miles from the left bank of the Ganges. The population in 1891 was 16,236; the municipal income in 1897-98 was Rs.10,320. It conducts a large trade in sugar. The American Methodists have a mission, which maintains some aided schools, and there is an English high school for boys. The district of BIJNOR has an area of 1898 square miles, and had a population in 1891 of 794,070, being 417 persons per square mile. Classified according to religion, Hindus numbered 525,002; Mahommedans, 267,162; Christians, 908, of whom 30 were Europeans; "others," 998. In 1901 the population was 779,361, showing a decrease of 2 per cent. The land revenue and rates were Rs.13,99,964, the incidence of assessment being R.1:2:4 per acre; the number of police was 2459. The country is watered in most parts by streams from the hills. A series of small canals has been constructed. Out of a total cultivated area in 1896-97 of 601,601 acres, 18,958 were irrigated from canals, and 26,969 from wells. Sugar is largely exported. A line of the Oudh and Rohilkhand railway from Moradabad to Saharanpur has been opened through the district.

Bikanir, a native state of India, in the Rajputana agency, with an area of 2309 square miles. The population in 1881 was 509,021, and in 1891 was 831,955, giving an average density of 36 persons per square mile. In 1901 the population was 584,712, showing a decrease of 30 per cent. due to the results of famine. The present Maharaja, Ganga Singh, was born in 1879, succeeded in 1887, and was intrusted with full powers in 1898. In 1897-98, the gross revenue was Rs.21,46,064. The

expenditure included Rs.1,41,191 on railways, and Rs.1,54,462 on irrigation. The military force consists of 500 men, besides the imperial service corps of the same strength, maintained at a cost of Rs.1,56,000. This corps took part in the China expedition of 1900-1. There are 17 schools with 1606 pupils, including a high school affiliated to the university of Allahabad, a school for the sons of nobles, and a girls' school called after Lady Elgin. The railway from Jodhpur is being extended towards Bhatinda in the Punjab; on the northern border, the Ghaggar canal in the Punjab irrigates about 5000 acres. Coal has been found in the state. Drought is of common occurrence. The famine of 1899-1900 was severely felt. The chief agricultural stock consists of camels, and an annual show has been started to improve the breed. The principal industries are the weaving of woollen fabrics, carving, and the making of ivory bracelets ornamented with gold.

The city of **BIKANIR** has a railway station. The population in 1881 was 43,283; in 1891 it was 56,252. It has special manufactures of fine blankets and sugar-candy.

Bilaspur, a town and district of British India in the Chhattisgarh division of the Central Provinces. The town is situated on the right bank of the river Arpa. The population in 1891 was 11,122. It is now an important junction on the Bengal-Nagpur railway, where the two lines from the west meet on their way to Calcutta, 255 miles from Nagpur.

The district of **BILASPUR** has an area of 8341 square miles. The population in 1891 was 1,163,897, being 140 persons per square mile. Classified according to religion, Hindus numbered 1,059,457; Mahommedans, 11,101; aborigines, 93,126, chiefly Gonds; Christians, 128, of whom 70 were Europeans; "others," 85. In 1901 the population was 1,011,512, showing a decrease of 13 per cent., compared with an increase of 14 per cent. in the preceding decade. The total amount of land revenue and rates is returned as Rs.5,98,395, the incidence of assessment being 4 annas per acre of assessed area; number of police, 511. In 1897-98, out of a total cultivated area of 1,496,166 acres, only 3159 were irrigated from tanks, &c. The principal crops are rice, wheat, other food-grains, oil-seeds, and a little cotton. There are considerable manufactures of cotton cloth. In 1897-98 the number of schools was 158, attended by 9606 pupils. Bilaspur, which was formerly a very isolated tract, is now traversed in three directions by lines of the Bengal-Nagpur railway. It suffered severely from the famine of 1896-97. In 1897 the general death-rate was as high as 90 per thousand, rising to 297 in Bilaspur town. It suffered no less severely in 1900, when in May the number of persons relieved rose to one-fourth of the total population.

Bilbao, a town of Spain, capital of the Basque province of Biscay, on the river Ansa or Nervion, about 6 miles from the sea. Few cities in Spain have grown so rapidly in size, importance, and wealth as Bilbao in the last thirty years. The population, 17,649 in 1870, rose to 50,734 in 1887, 74,076 in 1897, and 83,213 in 1900. Since 1876 a completely new town has been mapped out, and "new" Bilbao is no longer confined to the right bank of the river. Fine broad streets, splendid squares and public gardens, hotels, villas, palatial new public buildings, a new post office, and numerous schools have come into existence, which vie with those of Madrid and Barcelona. The part of the town on the right bank is, however, still the great centre of business, the narrow streets containing the best of shops. There, too, are the banks, the town hall, the principal clubs, and the four principal churches. In

and around Bilbao there are more than thirty convents and monasteries, and at Olaviaga, about a mile off, the Jesuits have built a university, attended by 850 students. Public education is not, however, entirely in the hands of the priesthood and nuns: there are an institute, a normal school to train teachers, a school of arts and handicrafts, a nautical school, and sixteen public primary schools for both sexes. A fine modern theatre has been erected.

A meteorological institute publishes very complete statistics. The mean temperature in 1898 was 58.3° F., the maximum 106°, and the minimum 28.4°. Only eighty-five days were classed as clear, and the total rainfall for the year was 35.22 inches, that being 10.1 inches less than in 1897. During the year 1898 the marriages were 5.96 per 1000, the deaths 32.19, the living births 40.62, the legitimate children 54.26, the illegitimate 11.78. The foundling hospital had 1026 inmates at the close of 1898, with a death-rate of 102.29 per 1000. The prosperity of Bilbao since 1874 has been chiefly due to the development of the mining and metallurgic industries. By reason of this the town has become the centre of a network of railway lines unrivalled in any province in Spain, and the Harbour Works Board, constituted in 1877, has improved the river channel and the bar, made wharves and embankments, lighted the lower third of the river by electricity, so as to allow vessels to enter by night, and constructed a breakwater and counter-mole outside the bar of the river Nervion, between Santurce, Portugalete, and the opposite headland at Algorta, so as to secure deep anchorage and easy access to the river. Dry docks were constructed in 1896. The sums collected as customs duties in Biscay, 95 per cent. of which were drawn from the port of Bilbao, amounted in 1898 to £471,275 (at the old fixed rate of 25 pesetas to each pound sterling). The general movement of shipping in the same year showed 4005 vessels of 2,352,157 tons entered and cleared. Spanish vessels numbered 1754 of 494,877 tons, chiefly engaged in the coasting trade. Great Britain has been at the head of the shipping movement since 1880. In 1898, 157 British vessels entered, with cargoes of 133,701 tons, valued at £313,492, whilst 291 entered in ballast, with a tonnage of 269,876; 6 vessels cleared in ballast with a tonnage of 3430, and 1317 vessels with cargoes of 1,105,696 tons, valued at £1,522,823. The exports are chiefly iron ores, of which Great Britain took from all sources 3,043,000 tons in 1898, France 253,000, Holland and Belgium 968,000, in reality in transit for Germany. The new ironworks become more important every year. Five large firms in 1898 employed over 4000 persons, and produced 191,220 tons of pig iron, 83,423 tons of steel, and 80,910 tons of coke. The export of pig iron rose from 21,952 tons in 1895 to 51,942 tons in 1898. In the coasting trade the exports are mostly pig iron, codfish, and some products of local industries and agriculture. The exports of wines, in great part brought by rail from Navarre and the Ebro valley, has increased from 283,000 gallons in 1894 to 873,000 in 1898. The imports in 1898 included 407,837 tons of coal and 386,792 tons of coke from Great Britain. This total was seriously affected by the Welsh coal strike; in the previous year 431,273 tons of coal alone were imported, chiefly from England. Of great importance also were woods of all kinds from Sweden and Finland, and coastwise from Asturias (141,000 tons). Besides the mining and metallurgic industries, Bilbao has breweries, tanneries, flour mills, glass works, brandy distilleries, and paper, soap, cotton, and mosaic factories. In 1874 Bilbao was for months besieged unavailingly by the second Carlist pretender. Its relief enabled it to retain its title of "Invicta Villa."

(A. E. H.)

Bilejik, chief town of the Ertoghrol sanjak of the Brúsa viláyet in Asia Minor (Byzantine *Belocomé*), altitude 1900 feet, situated on a hill $2\frac{1}{2}$ miles from its station on the Ismid-Angora railway. It is an important centre of the silk industry, and has several silk-spinning factories. Population, 10,500 (Moslems, 7200; Christians, 3300).

Bilin (Czech, *Bilina*), a town in the government-district of Dux, in Bohemia, Austria, situated on the Biela, about 5 miles south-west of Teplitz. It is chiefly known for its alkaline mineral waters (from the "Biliner Sauerbrunnen") of which some two million bottles are annually exported. Another export article is a salt recovered from the waters by evaporation. Large quantities of lignite are mined in the vicinity, where there is also a number of limestone quarries. The town, which is very old and possesses the ruins of a castle dating from the 11th century, is further distinguished by the largest mass of phonolite or clinkstone in Bohemia—the "Biliner Stein"—about 1760 feet high. Indeed the town is surrounded by basaltic rocks. Population (1890), 6651, chiefly German; (1900), 7871.

Billiards.—Since 1875 the game of billiards has developed in a somewhat curious manner. Tables, balls, cues, and other implements have not been radically altered, though in some respects their manufacture has improved, but the best class of professional play was, if length of breaks be the measure, undoubtedly better in 1900 than it was twenty-five years before. On the other hand, public matches played now are for the most part less genuine struggles than of old. The reasons for these changes are not difficult to explain. Formerly the stakes were more generally real, and were the chief inducement for exertion and the reward of success; games were short and slow, great caution being exhibited, and players had to be content with slender pay. More recently gate-money has far exceeded the value of any stake, so that the problem before players has been less how to win than how to get the most entrance-money from the public. Much attention has been given to this question, and many clever persons have assisted in its solution; but unquestionably the chief credit for developing the game must be given to John Roberts, sen., and to his son of the same name who has long held the position of champion. Indeed, their careers form the history of modern billiards from 1849, when the elder Roberts challenged Kentfield (who declined to play) for the championship. No useful comparison can be made between the last-named men, and the change of cushions from list to india-rubber further complicates the question. Kentfield represented the best of the old style of play, and was a most skilful performer; but Roberts had a genius for the game, combined with great nerve and physical power. This capacity for endurance enabled him to practise single strokes till they became certainties, when weaker men would have failed from sheer fatigue; and that process applied to the acquisition of the spot-stroke was what placed him decisively in front of the players of his day until a younger generation taught by him came forward. His all-round play, especially in strokes which required great strength or power of cue, was better for at any rate twenty years than that of any contemporary; yet his main influence in developing the game during that period lay in his mastery of the spot-stroke, which became practically the measure of proficiency. "Tell me how many spots you can make, and I will handicap you" was then a common remark. In 1869 the younger generation had caught him up, and soon afterwards surpassed him at this stroke; both W. Cook and J. Roberts, jun., carried it to greater perfection, but they were in turn put entirely in the shade by W. Mitchell and W. J. Peall. The latter's remarkable break (3304), made at the Aquarium in 1890,

has never been approached. But this very perfection killed the stroke, for the public wearied of its monotony. Adroit use of this objection was made by professional players who could not play the stroke so well, and "spot-barred" matches were generally introduced. It is curious to realize that John Roberts, sen., developed the game chiefly by means of spot-play, whereas his son continued the process by abandoning it. The public, however, liked quick scoring and long breaks, and therefore a substitute had to be devised. This was provided chiefly by the younger Roberts, whose fertility of resource and manual dexterity eventually placed him by a very long way at the head of his profession. In exhibition matches he barred the spot-stroke and gave his attention chiefly to play which kept the three balls near the spot and under control not far from each other. Thus instead of a long succession of winning hazards he developed a series of two winning hazards (one from where the red ball happened to lie, the next from the spot) followed by a cannon. This style of play was soon brought to great perfection. Stroke followed stroke with rapidity and certainty nearly equalling spot-play, the main difference being that three strokes scored 8 instead of 9. This method is known as top-of-the-table play, and may perhaps be best defined as an endeavour, after every cannon, to leave the opponent's ball near the spot and the red ball near a pocket, so that the next stroke may be an easy winning hazard, to be so played that either a spot-stroke or cannon may be left. Like spot-play, but even to a greater degree, it is a dangerous game for a bad hazard-striker, because in case of a break-down the balls are likely to be left near each other, close to a pocket, and consequently the opening is favourable to the adversary. On the other hand, it presents a rapid means of scoring to a good hazard-striker; few of the strokes are very difficult, judgment rather than execution being required, while strength or force is seldom needed after the necessary position has been gained.

The next development was borrowed from the French game, which consists entirely of cannons; and in America it has practically superseded other forms of the game. Both French and American professors, giving undivided attention to cannons and not being permitted to use the push-stroke, arrived at a perfection in controlling or "nursing" the balls to which English players could not pretend; yet the principles involved in making a long series of cannons were applied, and leading professionals soon acquired the necessary delicacy of touch. The plan is to get the three balls close to each other, say within a space which a hand can cover, and not more than from four to eight inches from a cushion. The striker's ball should be behind the other two, one of which is nearer the cushion, the other a little farther off and farther forward. The striker's ball is tapped quietly on the one next the cushion, and hits the third ball so as to drive it an inch or two in a line parallel to the cushion. The ball first struck rebounds from the cushion, and at the close of the stroke all three balls are at rest in a position exactly similar to that at starting, which is called by the French *position mère*. Thus each stroke is a repetition of the previous one, the positions of the balls being relatively the same, but actually forming a series of short advances along the cushion. With the push-stroke a great number of these cannons could be quickly made, say 50 in $3\frac{1}{2}$ minutes; and, as that means 100 points, scoring was rapid. Most of the great spot-barred breaks contained long series of these cannons, and their value as records is correspondingly diminished, for in such hair's-breadth distances very often no one but the player, and sometimes not even he, could tell whether a stroke was made or missed or was foul. Push-barred, the cannons are played nearly as fast; but with most men the

series is shorter, *massé* strokes being used when the cannon cannot be directly played. To this in professional hands there is no great objection, but with ordinary amateurs the danger of damaging the cloth is so great, and the chance of bringing off the stroke so small, that it would be more sensible to bar the *massé* than to bar the push. It is of course understood that from human and other imperfection the *position mène* is soon lost, and play has to be modified with the view of regaining it as quickly as possible. The most recent alteration in play is that the push-stroke is generally abandoned, perhaps with advantage; the game, therefore, as usually practised is push- and spot-barred.

A few words about the championship are here appropriate. When Kentfield declined to play in 1849, John Roberts assumed the title, and held the position till 1870, when he was defeated by his pupil W. Cook. The following table gives particulars of every match played for the championship, from which it will be seen that four men only have held that position, Roberts, sen., Cook, Roberts, jun., and Bennett; and that since 1885 no competitor has contested the younger Roberts's claim.

Points.	Date.	Players.	Won by
1200	Feb. 11, 1870	Cook b. Roberts, sen.	117
1000	April 14, 1870	Roberts, jun. b. Cook	478
1000	May 30, 1870	Roberts, jun. b. Bowles	246
1000	Nov. 28, 1870	Jos. Bennett b. Roberts, jun.	95
1000	Jan. 30, 1871	Roberts, jun. b. Bennett	363
1000	May 25, 1871	Cook b. Roberts, jun.	15
1000	Nov. 21, 1871	Cook b. Jos. Bennett	58
1000	Mar. 4, 1872	Cook b. Roberts, jun.	201
1000	Feb. 4, 1874	Cook b. Roberts, jun.	216
1000	May 24, 1875	Roberts, jun. b. Cook	163
1000	Dec. 20, 1875	Roberts, jun. b. Cook	135
1000	May 28, 1877	Roberts, jun. b. Cook	223
1000	Nov. 8, 1880	Jos. Bennett b. Cook	51
1000	Jan. 12, 13, 1881	Jos. Bennett b. Taylor	90
3000	March 30, 31, and April 1, 1885	Roberts, jun. b. Cook	92
3000	June 1, 2, 3, 4, 1885	Roberts, jun. b. Jos. Bennett	1640

These games were all played on three-inch-pocket tables, and Roberts has fairly contended that he remained champion till beaten on such a table under the rules in force when he won the title or under a new code to which he was a consenting party. The nearest approach to a match for the championship since 1885 was that between Roberts and Dawson (March 20 to April 3, 1899) of 18,000 up, level, half the game at the Argyll Hall, Argyll Street, London, and half at the Egyptian Hall, Piccadilly. The main departure from a championship game lay in the table, which had ordinary, though not easy pockets, instead of three-inch pockets. The match excited much interest, because Dawson, who had already beaten North for the Billiard Association championship, was the first man for many years to play Roberts even. The performances of the players were often disappointing, particularly those by the champion, and the scores at the close of the first week's play (Roberts, 9001; Dawson, 8721) proved how closely the game was contested. Next week's play in the room to which Roberts was accustomed resulted in his favour, and he secured the game by 1814 points. Nevertheless, the result showed clearly that Dawson had greatly lessened the gap which for many years had separated Roberts from the next best player, and that he was entitled to challenge the champion on even terms. After this Dawson improved materially, and in 1899, for the second time, he won the Billiard Association championship. His position was challenged by Diggle and Stevenson, who contested a game of 9000 points. Stevenson won by 2900, but lost to Dawson by 2225 points; he beat him in January 1901, but Dawson reasserted his superiority before the close of the spring.

A matter closely connected with the development of the game is the absence of a satisfactory and authoritative code

of laws or rules. Several codes more or less faulty exist, of which perhaps those of the Billiard Association are the best, but they do not command universal respect or acceptance. The want of a club or committee of sufficiently representative persons who shall be to billiards as the M.C.C. is to cricket has made itself apparent.

Record scores at billiards have greatly altered since W. Cook's break of 936, which included 292 spots, and was made in 1873. It may be useful to mention a few of the great breaks, since they are in some degree a measure of development; but too much weight must not be given to them, for tables vary considerably between easy and difficult ones, and comparisons are apt to mislead. Peall, in addition to the break of 3304 (1890) already mentioned, has made 2031 (1888), and has scored 1000 points in 44 minutes. Mitchell has made several breaks over 1000; while Memmott, from Australia, a very sound and steady player, is credited with 423 consecutive screw-back spot-strokes, which total 1269 points. Roberts, the champion, has made 1392 and 1017 spot-barred, and innumerable breaks between 1000 and 100, of which 155 (made in a game for the championship) is far from being the least remarkable. All the leading players have made very long spot-barred breaks, but as some were made push-in and others push-barred, whilst tables varied, no useful purpose is served in recording them.

Respecting the various games of Pool, it may be said that the old-fashioned *Following Pool* has been to a great extent superseded by *Black Pool*, in which hazard-striking has more influence than safety play, and players can join and leave the game on giving due notice. *Single pool*, a very good game, is now seldom seen, but *Pyramids* is still played, though nowadays knocking a ball off the table is a foul stroke, and is scored against the player. *Snooker*, a game combining pool and pyramids, is becoming popular, probably because of its additional element of chance. No universally accepted rules of this game exist, so players must agree before commencing how they will play, or follow the custom of the room.

Snooker is described in the volume on *Billiards* of the "Badminton Library," from which the following is extracted:—"The pyramid balls are set up in the usual way, and the striker always uses the white ball. The black ball is set on the billiard spot, the pink on the centre spot. Blue is placed just below the apex-ball of the pyramid, brown on the centre spot of the D, with yellow and green on the right and left corner spots. . . . A red ball counts one, yellow two, green three, brown four, blue five, pink six, and black seven. The score, if two persons are playing or sides are formed, may be marked on the board as at billiards. A red ball must be taken before a coloured ball can be played at; if the striker, playing on a red, holes it, and takes a coloured ball also, the latter does not count, and is spotted. If, playing on the red, he fails to hole it, but holes a coloured ball, the value of the latter is scored to the other side. . . . After taking a red, the striker must play on one of the coloured balls. If he holes one of them, any other balls that go down by the same stroke count to him. All coloured balls which are holed must be spotted immediately; if the striker plays before all are spotted, the stroke is foul. No red ball is ever put up. . . . If the striker gives a miss, the ball is left where it finally stops. If the striker is by law obliged to play on a red ball or on a coloured ball, but from the position of his own ball is unable to do so directly, he is said to be snookered; he must then make a *bond-fide* shot at the proper ball off the cushion, the penalty if he misses being the minimum penalty. . . . When all the red balls have been holed the others must be taken in proper pool order." For greater detail, reference to the "Badminton" volume must be made.

To the bibliography of Billiards given in the article in the ninth edition of the *Encyclopædia Britannica* the following should be added:—W. COOK. *Billiards*. Burroughes and Watts.—J. P. BUCHANAN. *Hints on Billiards*. Bell and Sons.—*Modern Billiards*. The Brunswick-Balke-Collender Co., New York.—VIGNAUX. *Manuel du Billard*. Paris, Delarue.—BROADFOOT. *Billiards*. Badminton Library (Longmans).—LOCOCK. *Side and Screw* (Longmans). For those interested in the purely mathematical aspect of the game—HEMMING. *Billiards Mathematically treated*. Macmillan.

(W. BR.)

Billiton (Dutch, *Blitoeng*), an island E. of Banca and W. of Borneo. Its area is 1847 square miles. The coasts are sandy or marshy; the geological formation Devonian and granitic, with laterites; the surface rises to an altitude of from 325 to 1670 feet. The rainfall is heavy, 102 to 126 inches. The products resemble those of Banca. In 1898-99, 82 mines (7553 workmen) produced 93,603 piculs (a picul=159 lb). The imports and exports, exclusive of tin, have been valued together for recent years at £85,000. The population of 41,558 includes 96 Europeans and about 12,000 Chinese. The natives belong to two classes, the *Orang Darat*, the aborigines (probably Malayan colonists), and the *Orang Sekah*, who live in boats. The capital, Tanjong Padang, on the west coast, has a population of 12,000.

Billroth, Albert Christian Theodor (1829-1894), Viennese surgeon, was born on 26th April 1829, at Bergen, on the island of Rügen, his family being of Swedish origin. He studied at the Universities of Greifswald, Göttingen, and Berlin, and after taking his doctor's degree at the last in 1852, started on an educational tour, in the course of which he visited the medical schools of Vienna, Prague, Paris, Edinburgh, and London. On his return to Berlin he acted for a time as assistant to Professor Langenbeck, and then in 1859 accepted the professorship of surgery at Zürich. Eight years later he was invited to fill the same position at Vienna, and in that city the remainder of his professional life was spent. In 1887 he received the distinction, rarely bestowed on members of his profession, of a seat in the Austrian Herrenhaus. He died at Abbazia, a winter resort on the Adriatic, where he had a beautiful villa, on 6th February 1894. Billroth was one of the most distinguished surgeons of his day. His boldness as an operator was only equalled by his skill and resourcefulness; no accident or emergency could disturb his coolness and presence of mind, and his ability to invent or carry out any new procedure that might be demanded in the particular case with which he was dealing, gained for him the appellation of "surgeon of great initiatives." At the same time he was full of consideration for the comfort and well-being of his patient, and never forgot that he had before him a human being to be relieved, not a mere "case" for the display of technical dexterity. He was especially interested in military surgery, and during the Franco-German war volunteered to serve in the hospitals of Mannheim and Weissenburg. His efforts did much to improve the arrangements for the transport and treatment of the wounded in war, and in a famous speech on the War Budget in 1891, he eloquently urged the necessity for an improved ambulance system, pointing out that the use of smokeless powder and the greater precision of the arms of modern warfare must tend to increase the number of men wounded, and that therefore more efficient means must be provided for removing them from the battlefield. Possessing a clear and graceful style, he was the author of numerous papers and books on medical subjects; his *Lectures on General Surgical Pathology and Therapeutics* ran through many editions, and were translated into many languages, and the same is true of his *Handbook of Sick Nursing at Home and in Hospitals*. He was of an exceedingly artistic disposition, and in particular was devoted to music. A good performer on the pianoforte and violin, he was an intimate friend and admirer of Brahms, many of whose compositions were privately performed at his house before they were published. At the time of his death he was engaged on a book on the *Physiology of Music*.
